The Ethernet performance can also be improved somewhat, if you start the Macintosh IICI in LocalTalk and then switch to EtherTalk. This wouldn't help in the MacTCP case either, unless you are running MacTCP over EtherTalk, rather

than standard Ethernet.

To ensure that you avoid the Ethernet performance problems, use an EtherTalk NB Revision L card, or use a video card, or use only black and white video. Note that the Revision L EtherTalk NB card has been shipping since December of 1989.

## System 38 Files: How to Convert for Use on a Macintosh (8/94)

Revised: 8/30/94  
Security: Everyone

System 38 Files: How to Convert for Use on a Macintosh (8/94)

=====

Article Created: 8 March 1990  
Article Reviewed/Updated: 30 August 1994

TOPIC -----

Is there a product that interprets IBM System 38 EBCDIC files with all character formatting (that is, Bold Type, Type Sizes, Underline, and so on) into a Quark Xpress document for page layout?

DISCUSSION -----

Before a translation can take place, the files need to be moved from the System 38 to the Macintosh. This can be accomplished with Andrew Corp., IDEAssociates, or Wall Data products which are a combination of hardware and software that lets the Macintosh become a window in the System 38. These product provides file transfer methods to move the files from the System 38 to the Macintosh.

If the System 38 files are in an RFT/DCA file format, there are translation applications that convert to a MacWrite or Microsoft Word file format. Quark XPress can then open the MacWrite or Microsoft Word file for placement in the page layout.

Apple File Exchange provides one method of translation with the supplied documents. This is a basic RFT/DCA translator. Another method is to use Microsoft Word; it has its own mechanism for reading RFT/DCA files. Again, this is a basic translator. Also, DataViz publishes MacLink Plus/Translators that translates RFT/DCA files. Use of the DataViz AFE translators is probably the most comprehensive translation available.

If the System 38 files are not in an RFT/DCA format, it is not likely that the files can be transferred and translated while maintaining text style and formatting. A plain text file normally is all that is available if the RFT/DCA format is not used on the System 38.

In summary, first transfer the file from the System 38 to the Macintosh via the one of the terminal emulator products. Next, use one of the translation

products to convert the transferred file into a MacWrite or Microsoft Word file format. Finally, open the translated file with Quark XPress and place the contents of the file in the layout.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Change History:

30 Aug 1994 - Updated list of terminal emulator vendors.

12 Feb 1993 - Updated KMW now Andrew Corporation.

## Needed: Teleprompting Software for the Macintosh

Revised: 6/29/90  
Security: Everyone

Needed: Teleprompting Software for the Macintosh

=====

This article last reviewed: 8 March 1990

TOPIC -----

Do you know of any Macintosh-based software for teleprompting?

DISCUSSION -----

We don't know of a software-only solution for teleprompting. However, Listec makes the A-5000, a complete hardware system available from Listec. The A-5000 is a black box that connects to the printer port of a Macintosh. Any application that prints via a Chooser device can be used to supply the words for prompting. A print driver that outputs ASCII is needed--most daisy-wheel printer drivers provide ASCII output from the Macintosh. The A-5000 requires its input to be in ASCII text form.

The output of A-5000 needs to go to a teleprompting display device. Listec makes a variety of display devices, including the transparent glass prompters used by podium speakers and the video screens mounted on studio video cameras.

For more details, search the Tech Info library under "Listec."

## LocalTalk PC Card: How to Run TOPS on It

Revised: 6/29/90  
Security: Everyone

LocalTalk PC Card: How to Run TOPS on It

=====

This article last reviewed: 8 March 1990

TOPIC -----

I have a problem with TOPS on my LocalTalk PC Card; I can't get it to start. I have talked with TOPS, and they told me to load Apple's driver in CONFIG.SYS. I am using TOPS 2.1 and AppleShare PC 1.2. What driver should I load in the CONFIG.SYS file to run TOPS on my LocalTalk PC Card?

DISCUSSION -----

We believe that the file you are talking about is the ATALK.EXE file. This program is installed when you run the AppleShare PC Installer program, and when run, loads the LocalTalk PC Card driver into memory. We suggest that the best way to get all of the files installed in the right order and place is to run the Installer program. It places a line in the AUTOEXEC.BAT file that loads the LocalTalk PC Card driver at startup. Complete instructions on how to install all of the AppleShare PC program are in the "AppleShare PC User's Guide" on pages 7 through 14.

If you want to modify the AUTOEXEC.BAT file to load the ATALK.EXE file, it is important to get the order in which you execute the AppleShare PC installation files correct. The order of the six basic files is:

- 1) ATALK
- 2) ASHARE
- 3) MINSES
- 4) REDIR
- 5) ANET AUTO
- 6) DA/R

Instructions for this are on pages 184 and 185 of the "AppleShare PC User's Guide."

You also might have to change the "Lastdrive" command in CONFIG.SYS. This

command specifies the maximum number of drives that DOS recognizes. The default highest drive is E. To specify a greater number of drives, give the highest drive a letter you are likely to use. For example, "LASTDRIVE = F" gives you six possible drives. This is the only change that you may need to make to the CONFIG.SYS file.

Think C Provides Cursor-Positioning and Inverse Video

=====

This article last reviewed: 8 March 1990

TOPIC -----

I want to port an in-house application to the Macintosh. I want to have a true Macintosh interface on this application eventually. However, to service the people that already have Macintoshes, I first want a quick, direct port to the platform with the same DOS interface they have been using.

The program is written in C and uses basic screen positioning and reverse video calls to interact with the user. I am looking for a C compiler that has a "tty library" (or something similar) that they can link into their program to create a tty window on the Macintosh screen automatically and then be able to make calls to position the cursor within that tty window. I wouldn't mind if I lost the reverse-video capability, but I definitely need the cursor-positioning capability.

I would like to write the Macintosh interface port of the application in MPW C, but I haven't seen a "tty library" in MPW that can do the job on the "quick-and-dirty" port. Does MPW or any other C compiler have such a library?

DISCUSSION -----

Think C, from Symantec, offers an ANSI console package with cursor-positioning and inverse video capabilities. As of January, 1990, MPW C did not offer these functions. For more details, search the Tech Info library under "Symantec."

Macintosh: Remote 3278 Connection

=====

This article last reviewed: 8 March 1990

TOPIC -----

I need information on a bisynchronous modem and software to dial into the company mail system from my Macintosh SE at home. I need to emulate a 3278 and run SDLC at 2400 baud.

DISCUSSION -----

First, there is no such thing as a bisynchronous modem. We think you're probably thinking of a synchronous modem in this case.

- MacMainFrame DX allows the option of remote connectivity over asynchronous modems and is a possible solution.
- A second solution is to run IBM 3278 emulation using MacTerminal on the Macintosh and dial into DCA IrmaLine (AppleLine) through a pair of Hayes-compatible, asynchronous modems. The IrmaLine is, in turn, connected to a cluster controller via coax. The cluster controller connects to the Front-End Processor (FEP) using synchronous modems.
- A third solution is SimWare's Mac3270, which supports remote mainframe access via asynchronous modems. Sim3278 software has to be installed on the host.

## Macintosh IIci Video: Supported Resolutions and Scan Rates

Revised: 7/9/92  
Security: Everyone

Macintosh IIci Video: Supported Resolutions and Scan Rates

Article Created: 12 March 1990  
Article Last Reviewed: 8 July 1992  
Article Last Updated:

TOPIC -----

I want to use a Zenith VGA monitor with the Macintosh IIci. The horizontal scan rate for the monitor is 31.49, and the hertz rate is 60-70. Can I adjust the scan rate on the Macintosh IIci, so that it will work with this monitor?

DISCUSSION -----

The Macintosh IIci RBV (RAM-Based Video) supports the following resolutions and scan rates:

| ID1 | ID2 | ID3 | Monitor type                       | Format  | Vert.  | Horiz.   |
|-----|-----|-----|------------------------------------|---------|--------|----------|
| --- | --- | --- | -----                              | -----   | -----  | -----    |
| 0   | 0   | 0   | Unsupported monitor (video halted) |         |        |          |
| 0   | 0   | 1   | Unsupported monitor (video halted) |         |        |          |
| 0   | 1   | 0   | Reserved for future use            |         |        |          |
| 0   | 1   | 1   | Apple High-Resolution Monochrome   | 640x480 | 66.7Hz | 35KHz    |
| 0   | 1   | 1   | AppleColor High-Resolution RGB     | 640x480 | 66.7Hz | 35KHz    |
| 1   | 0   | 0   | 15-Inch Portrait Display           | 640x870 | 75Hz   | 68.86KHz |
| 1   | 0   | 1   | Reserved for future use            |         |        |          |
| 1   | 1   | 0   | Unsupported monitor (video halted) |         |        |          |
| 1   | 1   | 1   | No external monitor (video halted) |         |        |          |

1=no connection; 0=grounded

For an analog RGB monitor to work on the Macintosh IIci, it needs to meet one of the above specifications.

Here are the pinouts for the Macintosh IIci RBV connector:

|       |             |                      |
|-------|-------------|----------------------|
| 01    | RED.GND     | Red Video Ground     |
| 02    | RED.VID     | Red Video            |
| 03    | CSYNC       | Composite Sync.      |
| 04    | MON.ID1     | Monitor ID, Bit 1    |
| 05    | GRN.VID     | Green Video          |
| 06    | GRN.GND     | Green Video Ground   |
| 07    | MON.ID2     | Monitor ID, Bit 2    |
| 08    | nc          | (No Connection)      |
| 09    | BLU.VID     | Blue Video           |
| 10    | MON.ID3     | Monitor ID, Bit 3    |
| 11    | C&VSYNC.GND | CSYNC & VSYNC Ground |
| 12    | VSYNC       | Vertical Sync.       |
| 13    | BLU.GND     | Blue Ground          |
| 14    | HSYNC.GND   | HSYNC Ground         |
| 15    | HSYNC       | Horizontal Sync.     |

## System and Finder Versions List

Revised: 6/29/90  
Security: Everyone

### System and Finder Versions List

=====

This article last reviewed: 12 March 1990

TOPIC -----

Is there a listing anywhere System Software disks that shows what versions of the System and Finder are on each set of disks?

DISCUSSION -----

We used the Copy Center disk images on the Information Source to put together this list:

| Disk Set Name         | System Version | Finder Version |
|-----------------------|----------------|----------------|
| -----                 | -----          | -----          |
| System Software 1.0   | System 3.2     | Finder 5.3     |
| System Software 1.1   | System 3.2     | Finder 5.3     |
| System Software 2.0   | System 4.1     | Finder 5.5     |
| System Software 2.0.1 | System 4.1     | Finder 5.5     |
| System Software 5.0   | System 4.2     | Finder 6.0     |
| System Software 5.1   | System 4.3     | Finder 6.0     |
| System Software 6.0   | System 6.0     | Finder 6.1     |
| System Software 6.0.2 | System 6.0.2   | Finder 6.1     |
| System Software 6.0.3 | System 6.0.3   | Finder 6.1     |
| System Software 6.0.4 | System 6.0.4   | Finder 6.1.4   |

## Peek, LTPeek, and Poke: Unsupported Internal Network Utilities

Revised: 6/29/90  
Security: Everyone

Peek, LTPeek, and Poke: Unsupported Internal Network Utilities

=====

This article last reviewed: 12 March 1990

TOPIC -----

Is there any documentation available for the "LTPeek" and "Poke" programs? I am using the software to learn more about supporting AppleTalk Internets and was wondering if there is any documentation available.

Also, what are the most up-to-date versions of these programs? Is there an "LTPeek" that supports AppleTalk Phase 2 networks yet?

DISCUSSION -----

There is no official documentation available for Peek or Poke. These programs have never been sold by Apple and were created as internal network utilities. At one time, they may have been distributed to developers, but they have never been supported for end users. Internally, LTPeek is the name of an Alpha 4.28 version of the Peek software. LTPeek and a similar utility used internally called EPeek or EtherTalk Peek are not public domain products and should not be made available to customers. They have been developed for our own testing and development purposes.

As far as we know, there are no LocalTalk Peek versions that specifically support AppleTalk Phase 2 networks. Peek captures the entire packet from the LLAP header down, so you should not have a problem using it from a LocalTalk cable.

We do not think that Peek and Poke are proper tools for learning to about supporting AppleTalk Internets. (This is analagous to learning to support UNIX by learning to use a debugger.)

A more informative approach for learning to support Internets would be to start with TrafficWatch, CheckNet, LAN Ranger, or other third-party "available and supported" products.

LocalTalk Peek only records and displays network data. If you want to read this data, you must first read "Inside AppleTalk." Poke is very similar. You must have a full understanding of the desired packets before they can be created. Poke requires the actual packet data to be typed into the data window by the user. It provides minimal help in creating a header. It is not designed as an end-user tool; it is a development tool.

## HyperCard: 1.2.5 with System 6.0.4 & Portable, IIci

Revised: 6/29/90  
Security: Everyone

HyperCard: 1.2.5 with System 6.0.4 & Portable, IIci

=====

Article Created: 12 March 1990  
Article Last Reviewed: 10 July 1992  
Article Last Updated: 10 July 1992

TOPIC -----

What are the functional differences between HyperCard 1.2.2 and 1.2.5? Is there a custom procedure for installing a minimum System 6.0.4 configuration, which is necessary to run HyperCard 1.2.5?

I use HyperCard quite extensively and need to know how much of my installed base to upgrade to System 6.0.4. HyperCard 1.2.5 apparently has some new features that I want to use.

DISCUSSION -----

There is an engineering document that describes the changes, but there is no release document that describes the programming code added to ensure compatibility with System 6.0.4. This is because the changes made were not additions to nor enhancements to any of HyperCard's functions. Changes were made to ensure compatibility with the Macintosh Portable and Sound Manager changes found in System 6.0.4.

The changes were:

- The method HyperCard uses to center a card on the display. This was changed so that it did a better job of centering on the Macintosh Portable display.
- Changes to the Sound Manager required changes to the HyperCard Dial command. Those changes are compatible only with System 6.0.4.

Any differences you may see within version 1.2.5 were probably added in version 1.2.2, and you're just now noticing these changes.

You do not need to run HyperCard 1.2.5, unless you are using a Macintosh

Portable or Macintosh IIci. However, there is at least one advantage to installing System 6.0.4 and HyperCard 1.2.5 on all systems. You get the benefit of a fix to the 800K drive eject code. The code increases the reliability of the drive by moving the drive head away from the disk when it ejects. Installing a minimal 6.0.4 System for running HyperCard is not a problem.

If you want to upgrade your system, there are no special installation procedures other than running the System Installer for System 6.0.4. Installing HyperCard 1.2.5 means copying the file on to the customer's disk.

## A/UX: Partitioning Hard Drives (9/94)

Revised: 9/20/94  
Security: Everyone

A/UX: Partitioning Hard Drives (9/94)

=====

Article Created: 12 March 1990  
Article Reviewed/Updated: 20 September 1994

TOPIC -----

My current system is a Macintosh IIfx with 5MB of memory and three 80MB hard drives. The first 80MB drive is partitioned for Macintosh OS only. The second has a 2MB Macintosh OS partition, and the rest is the factory-installed A/UX. The third drive is not formatted or partitioned. On it, I want to create a 20MB Macintosh OS partition and a 60MB A/UX partition and file system.

Although creating the partition with HD SC Setup seems straightforward, what partition type should I assign to each? (Before, I used "Misc A/UX" and Macintosh OS.)

When I tried to use "mkfs" and "mount," I was able to create a file system and mount it. However, whenever I restarted the machine, I got an error tone, and the screen went blank. I had to restart the system and turn off the third hard drive. It then started up correctly.

What are the correct parameters or prototype file needed for mkfs for an Apple HD80 SC with the above configuration? If I do not use parameter files, what do I call the partition to mount it?

DISCUSSION -----

It seems that you don't have problems creating partitions using the HD SC Setup program. We think that the partition types you chose for Macintosh OS (20MB) and Misc A/UX (60MB) are correct. You may also choose "UNIX Usrc" or "Free UNIX Slice x" for A/UX partition type. If you choose "Usrc" partition type, A/UX will assign slice number 2 (/dev/[r]dsk/cXd0s2) as the default.

Generally, the partition type "Misc UNIX" is best avoided, simply because of the inconvenience of using dp. Do not use the Autorecovery partition for personal files. You should never need to associate the Autorecovery partition with a slice because the autorecovery utilities will do this when necessary.

Note that if you chose the "Misc A/UX" partition type in HD Setup, you have to "pname" this partition to a slice before you can "mkfs" on that partition in A/UX. Here is an example to make a new file system on the "Misc A/UX" partition with SCSI ID #5 and slice 3:

```
Login as root
# pname -c5 -s3 "Misc A/UX"
==> /dev/dsk/c5d0s3
```

```
Using the "dp" command to display the "Misc A/UX" partition map
information, write down the total number of blocks in the partition.
This number will be used in the "mkfs" command.
# dp /dev/rdisk/c5d0s31
==> Command?
```

```
Make the file system on that partition with disk interleave factor 1 1
# mkfs /dev/dsk/c5d0s3 total-number-of-blocks-from-dp 1 1
```

```
It is always good practice to do a "fsck" after "mkfs"
# fsck /dev/rdisk/c5d0s3
```

```
Mount the "Misc A/UX" file system on a mount point, say "misc".
Create a "misc" directory from root, if it has not been created.
# mount /dev/dsk/c5d0s3 /misc
```

```
Make a lost+found directory for "fsck" purposes.
# cd /misc
# mklost+found
```

This completes the task of making a new file system.

If you want to have an automatic "fsck" when A/UX is booting, insert this line in the /etc/fstab file:

```
/dev/dsk/c5d0s3    /misc    5.2    rw    1    2
```

Note that because /misc is a non-root file system, the pass # (the last field) should be greater than or equal to 2, so that it will be checked in /etc/rc automatically.

To pname automatically, insert this line in the /etc/ptab file:

```
Misc A/UX::5:0:3:Misc partition
```

or include the -a option in the above "pname" command. You also may want to add the -a option to pname. This creates a new entry in /etc/ptab for the partition. For example:

```
# pname -a -c5 -s3 "Misc A/UX"
```

For more information on preparing a hard disk for A/UX, refer to the A/UX Local System Administration manual.

## AppleShare PC: GatorBox Directory Display Problem

Revised: 6/29/90  
Security: Everyone

AppleShare PC: GatorBox Directory Display Problem

=====

This article last reviewed: 12 March 1990

TOPIC -----

I am using the LocalTalk PC Card and AppleShare PC am trying to mount a VAX running Ultrix as an AppleShare volume through a GatorBox. The system knows that they are there because it shows in the Chooser. They have also been successfully attached to the VAX as the D: drive. However, when I do a D:DIR, it shows that there are 10 files and 2 directories (which is the case) but but fails to give a list of the names of the files or the directories. If they know the filename and directory, they can use the file.

The Macintoshes and PC are on LocalTalk, and the VAX is on Ethernet. They are running Ultrix 3.1. The PC is a Compaq DeskPro running the Compaq version of DOS. The IP address of the VAX was downloaded to the GatorBox. The GatorBox is publishing the AFP volume. NFS is running on the VAX.

Do you have any suggestions?

DISCUSSION -----

We ran some tests on our network and were able to duplicate your problem easily. Our test configuration consisted of a Macintosh running A/UX, a GatorBox, and AppleShare PC 2.0 running on an IBM AT.

In our test, we could not see any files or directories on the mounted drive. We could not type any files or change directories (using CD command), even when we knew their filenames. In fact, when we tried to change the directory, the GatorBox crashed, and all zones on the network disappeared from the Chooser.

We contacted Cayman Systems, and they confirmed that this is a known problem with the GatorBox. A fix is being tested and should be sent automatically to all users in a new version. This new version will also support AppleTalk Phase 2. Users with this problem should contact Cayman Systems for a release date.

For more details, search the Technical Info library under "Cayman Systems."

## AppleTalk-to-AS/400 Gateway (8/94)

Revised: 8/30/94  
Security: Everyone

AppleTalk-to-AS/400 Gateway (8/94)

Article Created: 3 April 1990  
Article Reviewed/Updated: 30 August 1994

TOPIC -----

Does anyone sell a AppleTalk and AS/400 gateway?

DISCUSSION -----

There are two third-party vendors who sell products that use AppleTalk networks and Gateways for connecting to an IBM AS/400, Andrew Corp. and Wall Data.

Andrew Corporation

-----  
Has an AppleTalk and AS/400 gateway. Net Axxess consists of a half-sized NuBus card for a Macintosh II and Net Axxess software. The gateway permits existing LocalTalk, EtherTalk, or TokenTalk cabling to connect the gateway and the users' Macintosh computers. Each Net Axxess card can connect as many as seven Macintosh computers on the network connect to the host.

Token Axxess client is designed for sharing IBM workstation sessions among Macintosh computers on an AppleTalk network (LocalTalk, EtherTalk, or TokenTalk) through Token Ring. Token Axxess uses LU6.2 services provided by the SNA•ps Gateway.

Wall Data

-----  
Has SNA•ps 5250 is a full-function 5250 display terminal emulation program that allows Macintosh computers to communicate with IBM AS/400 systems. This application provides multiple session windows that can be individually configured with different color settings, font sizes, connection paths, and host languages.

The SNA•ps 5250 application software works with the Apple Token Ring 4/16 NB Card or Apple Serial NB Card installed in any Macintosh II or Macintosh Quadra (NuBus capable) computer and supports directly connected or AppleTalk

distributed 5250 sessions.

In an AppleTalk network with an SNA•ps Gateway installed, SNA•ps 5250 users can access AS/400 services from the Macintosh Plus and later systems. In addition, users can access multiple gateways for concurrent access to multiple AS/400 systems.

SNA•ps Print allows a Macintosh computer to receive print data from an IBM AS/400 system and print the data on any printer in the AppleTalk network.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## ImageWriter II/L: Specifications and Notes (9/94)

Revised: 9/1/94  
Security: Everyone

ImageWriter II/L: Specifications and Notes (9/94)

Article Created: 12 March 1990  
Article Reviewed/Updated: 1 September 1994

TOPIC -----

In late February, 1990, a revised ImageWriter II rolled into distribution. This revised printer incorporates a new enclosure, different color adjustment assembly, and a new layout of the electronics including a changeover to a switching power supply. The ImageWriter II/L's electronic interface, DIP switch definitions, plus the paper handling mechanism have not changed.

Note: In future articles that deal specifically to the new ImageWriter II, we will use the term "ImageWriter II/L." The "L" follows the service designation.

This article describes changes for the new printer.

DISCUSSION -----

### Change List

-----  
These are the major changes to the ImageWriter II:

- The bottom housing is now a single molded piece of plastic. The metal pan at the bottom no longer exists. Both legs are now an integral part of the enclosure and are not removable. The power and serial connectors have been moved to the sides of the printer. Access to all parts in the ImageWriter II is now from the top.
- The color adjustment assembly has changed. The adjustment procedure is documented in the Service Manual.
- The driver circuitry has been combined with the main logic board and that separate circuit board has been eliminated.
- The new power supply is now a switching type. This lowers the unit's weight

and overall power consumption. The universal power supply option has been eliminated; there are only 100 V or 200 V supplies.

- The on-board RAM buffer has been increased to 24K bytes. The old 32K byte memory-option card has no effect with this new printer.

#### Specification Changes

These changes result in the following difference in specifications:

|                      | Old ImageWriter II                                | New Imagewriter II    |
|----------------------|---------------------------------------------------|-----------------------|
|                      | -----                                             | -----                 |
| Weight               | 25 pounds (11.36 kg)                              | 15 pounds (6.7 kg)    |
| Power Supply Options |                                                   |                       |
| 100 V                | 108-132 VAC, 60 Hz                                | 90-132 VAC, 50/60 Hz  |
| 200 V                | 90-264 VAC, 50/60 Hz                              | 180-264 VAC, 50/60 Hz |
| Power Consumption    |                                                   |                       |
| Operating            | 180 watts maximum                                 | 77 watts maximum      |
| Standby              | 20 watts maximum                                  | 16 watts maximum      |
| Input Buffer Size    | 2K bytes,<br>32K bytes with<br>memory option card | 24K bytes             |

Otherwise all other specification remain the same as with the previous ImageWriter II.

These changes reduce the weight and power consumption of the printer. However, the operation and usage of the revised ImageWriter II have not changed from the previous design.

#### Identification

Although the new ImageWriter II retains the old name, the marketing model number has changed to C0090LL/A. The serial number starts with the prefix TJ945100.

The new unit can be identified easily. Notice that the power and serial connectors do not plug into the leg, but to the rear side of the printer.

#### Service

The new enclosure design greatly simplifies the servicing of the unit. For additional information on take-apart, refer to the ImageWriter II/L ("L" is a Service only designation) s0/on in Volume II of the "Apple Service Technical Procedures Cross Family Peripheral Guide."

#### Technical Specifications

##### Printing Specifications:

Method: Impact dot matrix, logic seek (line by line)

Maximum Speed (characters per second at characters per inch):

- Draft mode: 250 cps @ 10 cpi
- Correspondence mode: 180 cps @ 10 cpi
- Near Letter Quality mode: 45 cps @ 10 cpi

Maximum Line Length: 8 inches

Paper Feed Direction: Forward and reverse

Maximum Line Feed Speed: 24 lps @ 6 lpi

Paper Feed Method:

- friction
- friction/pin-feed

Ribbon:

- Black ribbon
  - continuous fabric
  - 13 by 13000mm
  - Capacity: 2 million characters
- Color ribbon
  - Four colors: magenta, cyan, yellow, black
  - continuous
  - 21 by 18000mm

Character Specifications:

Dot Matrices for each Character Format:

|                      | dots wide | dots high |
|----------------------|-----------|-----------|
| Standard:            | 7         | 8         |
| Draft:               | 12        | 8         |
| Near Letter Quality: | 16        | 16        |
| Custom:              | 16 max.   | 8 max.    |

-- Custom fonts are user-programmable and loaded down to the ImageWriter II.

Standard Character Sets:

- ASCII (alphanumeric and symbols): 96
- European language characters: 28
- Mouse Text characters: 32

Vertical Dot Spacing: 1/72 of an inch

Horizontal Pitches and Graphic Densities:

| Characters<br>per inch | Characters<br>per line | Dots<br>per inch (approx) |
|------------------------|------------------------|---------------------------|
| 17                     | 136                    | 136                       |
| 15                     | 120                    | 120                       |
| 13.4                   | 107                    | 107                       |
| 12                     | 96                     | 96                        |

|                |          |     |
|----------------|----------|-----|
| 10             | 80       | 80  |
| 9              | 72       | 72  |
| Proportional-1 | variable | 160 |
| Proportional-2 | variable | 144 |

Line Spacing:

- 1/144 to 99/144 of an inch
- selectable in increments of 1/144 of an inch

Paper Specifications

Width:

- 3.5 to 9.5 inches (88.9 to 241.3 millimeters) pin to pin (pin feed)
- 10 inches maximum

Thickness:

- 0.002 - 0.011 inch (0.05 - 0.28 millimeters)
- Original plus 3 copies maximum

Types:

- Single sheets
- Pin-feed paper
  - 4.0 to 9.5 inches between hole centers

Power Specifications:

Options:

- Low-range: 90-132 VAC, 50/60 Hz;
- High-range: 180-264 VAC, 50/60 Hz;

Consumption:

- Operating: 77 watts maximum
- Standby: 16 watts maximum

Interface Specifications:

Data Input Form: RS-232 8-bit asynchronous serial

- 1 start bit
- 8 data bits
- 1 stop bit (no parity)

Data Input Codes:

- Characters: ASCII, 8- or 7-bit
- Graphics: 8-bit binary

Transmission speeds: 300, 1200, 2400, or 9600 baud

Input Buffer Size: 24K bytes

Connections: Mini-circular connector, 8-pin socket or equivalent

Cable Connector: Mini-circular connector, 8-pin plug or equivalent

Physical Dimensions:

Weight: 15 pounds (6.7 kilograms)

|         | inches | millimeters |
|---------|--------|-------------|
| Width:  | 17.0   | 431.8       |
| Height: | 12.0   | 304.8       |
| Depth:  | 5.0    | 127.0       |

Environmental Specifications:

Ambient Temperature:

|            | Degrees     |           |
|------------|-------------|-----------|
|            | Fahrenheit  | Celsius   |
| Operating: | 50 to 104   | 10 to 40  |
| Storage:   | -40 to +116 | -40 to 47 |

Humidity:

Operating: 20% to 95% relative humidity, noncondensing

Storage: 10% to 95% relative humidity, noncondensing

Acoustics, Operating:

55 dBa maximum sound pressure at by-stander position (as defined in American National Standard document ANSI S1.29-1979)

## AppleShare: Restricting User Space and Hard Disk Partitioning

Revised: 6/29/90  
Security: Everyone

AppleShare: Restricting User Space and Hard Disk Partitioning

=====

This article last reviewed: 12 March 1990

TOPIC -----

- 1) Is there any software that lets an administrator of an AppleShare file server limit the amount of space a specific user or folder can use?
- 2) Is there software that lets the administrator partition the hard drive in two or more Macintosh partitions that appear to the server as separate volumes?

DISCUSSION -----

- 1) We don't know any software that limits the amount of disk space that a user or folder can occupy
- 2) Any software that creates true partitions on a hard disk should work properly with the AppleShare File Server software. Silverlining, from La Cie, is an example of software that creates true partitions on a hard disk that work with the AppleShare File Server software. Software that creates a file on the hard disk instead of a true partition may not work. SUM Partition software, from Symantec, creates an invisible file on the hard disk and makes it appear as a separate volume to the Macintosh file system. AppleShare recognizes this as a separate volume.

Other software may also work. Please check with the manufacturer or distributor of disk partitioning software for compatibility with the AppleShare File Server software. For more details, search the Technical Info library under "LaCie" and "Symantec."

## System Software: Configs for Mac 128K, XL, 512, & 512KE (7/94)

Revised: 8/3/94  
Security: Everyone

System Software: Configs for Mac 128K, XL, 512, & 512KE (7/94)

Article Created: 3 April 1990  
Article Reviewed/Updated: 26 July 1994

TOPIC -----

What System Software (System, Finder, and AppleShare) versions can be used on the Macintosh 128K, Macintosh XL, Macintosh 512, and Macintosh 512KE?

DISCUSSION -----

### Macintosh 128K

-----  
Currently ships with: Product no longer available.  
Supports: System 2.0 and Finder 4.1.  
Recommended: System 2.0 and Finder 4.1.  
For AppleShare, use: Can not be used as an AppleShare file server or workstation.

### Macintosh XL

-----  
Currently ships with: Product no longer available.  
Supports: System Software 1.0 and System Software 1.1.  
Recommended: System Software 1.1.  
For AppleShare, use: Can not be used as an AppleShare file server or workstation.

### Macintosh 512K

-----  
Currently ships with: Product no longer available  
Supports: System Software 1.0 and System Software 1.1  
Recommended: System Software 1.1.  
For AppleShare, use: The Macintosh 512K cannot use the AppleShare 2.0 workstation software. You can still use the AppleShare workstation software version 1.1 with a file server that uses AppleShare File Server 2.0, although you will not be able to take advantage of

the new features of AppleShare File Server 2.0.  
System 3.3 and Finder 5.5 are installed by the  
AppleShare 1.1 Work Station Installer disk.

#### Macintosh 512KE

-----

Currently ships with: Product no longer available

Supports: System Software 1.0, System Software 1.1, System Software  
2.0, and System Software 2.0.1.

Recommended: System Software 2.0.1.

For AppleShare, use: System 3.3 and Finder 5.5 are installed by the  
AppleShare 1.1 Work Station Installer disk; System  
3.4 and Finder 6.1 are installed by the AppleShare  
2.0 Macintosh 512KE Work Station Installer disk. This  
machine can not be used as an AppleShare file server.

\*\*For information on Macintosh computers newer than the models listed in this  
article, search for articles containing System Software Version and Enabler  
Matrix information.

#### Article Change History:

26 Jul 1994 - Revised article to only include early model Macintoshes.

## AppleTalk: File Server Open File Limitations

Revised: 6/29/90  
Security: Everyone

AppleTalk: File Server Open File Limitations

=====

This article last reviewed: 12 March 1990

TOPIC -----

A retailer asked if there is any limitations on the number of files you can have open on one server and if the limit is in AppleTalk.

He is going to have a database on a Novell server, and when they open a session to the database, they open a lot (close to 255) of files. If many users use the server at the same time, there will be a lot of files open at the same time. Are there any such limits in AppleTalk?

DISCUSSION -----

Actually, AppleTalk (typically) would not be the limiting factor in a scenario of this nature. Under the Macintosh OS, there is a default limit to the number of files that you can have open at one time. If you have less than 1MB of memory, this default is 10; if you have 1MB or more, the default is 40. This limit applies to local volumes as well as network-based volumes. Most databases that are network-aware use AppleTalk Filing Protocol (AFP) calls to access the files on a server. Files opened via AFP calls, just like files opened via the native filing interface, are counted in the operating system limit.

You can modify the limit of the number of open files by modifying the boot blocks on your startup volume, but this is not recommended and is (typically) not necessary. For example, 4th Dimension opens a number of files from a server when it is running in multi-user mode, but you still have plenty of "room" to operate within the open file limit.

If you are concerned by the number of files that are open on the server and not the workstation, remember that one file opened by multiple workstations counts as only one open file on the server. On a server with 2MB of memory or more, the maximum number of files that can be opened at one time is 160. If you have 1MB of memory, the maximum number of opened files is 60.

The number of files that can be opened on other servers (like a Novell server) depends on that manufacturer's implementation of an AFP-based server, because there is no specific limit in AFP.

## CD-ROM Developer Info in AppleCD SC Developer's Guide

Revised: 6/29/90  
Security: Everyone

CD-ROM Developer Info in AppleCD SC Developer's Guide

=====

This article last reviewed: 13 March 1990

TOPIC -----

I have been a couple of questions about CD-ROM development.

- Is there any lookup advantage to Apple CD-ROM format versus ISO 9660 or High Sierra format?
- What are the ramifications of creating an ISO 9660 disc for access by the Macintosh? Will you have to write specialized code to access parts of the disc, or will File Manager calls suffice?

DISCUSSION -----

CDs using ISO-9660 and High Sierra formats provide faster file location than those implementing HFS. However, HFS ROMs are easier to create.

Foreign File Access handles the conversion of File Manager calls to ISO 9660 and High Sierra discs.

Both of these questions are highly situation-specific, and the responses above are intentionally brief. In-depth information on developing CD-ROMs is available in the "AppleCD SC Developer's Guide" available from APDA (part #A7G0023/A). Chapter 3 deals with the questions you and your customers have raised.

## LaserWriter: Laser Specifications

Revised: 6/29/90  
Security: Everyone

LaserWriter: Laser Specifications

=====

This article last reviewed: 13 March 1990

TOPIC -----

I need information about the laser used in the LaserWriter family of printers. I am being asked to identify this information for safety reasons:

- Laser Type
- Class
- Power
- Wavelength

Can you help?

DISCUSSION -----

The LaserWriter uses a semiconductor laser that meets the Bureau of Radiation Hazards class I specifications. Its wavelength falls between 750 and 850nm (nanometers) and is rated at 5mW (milliwatts).

## Omnis 3plus: Problem Using National Fields with Macintosh IICI

Revised: 6/29/90  
Security: Everyone

Omnis 3plus: Problem Using National Fields with Macintosh IICI

=====

This article last reviewed: 13 March 1990

TOPIC -----

In Omnis 3plus on a Macintosh IICI fields set up as "National" appear as garbled text. On the other hand, a Macintosh IICx with System 6.0.4 works as fine.

Is there something in the Macintosh IICI ROMs (like international utilities or packages) that could cause this?

DISCUSSION -----

A Tech Support Engineer at Blythe Software told us that their Omnis 3plus software had a problem running on the Macintosh IICI. As a temporary solution, they suggested that the customer reinstall System Software 6.0.3 and change the National fields to character fields. This process will not result in an identical sort, but it is functional.

As of February 1990, Blythe was preparing a fix. For details on how to contact them, search the Technical Info library under "Blythe Software."

## System 6.0.4: Problems Installing on CD Installer Disk

Revised: 6/29/90  
Security: Everyone

System 6.0.4: Problems Installing on CD Installer Disk

=====

This article last reviewed: 13 March 1990

TOPIC -----

I tried to upgrade our AppleCD SC Installer disk to System Software 6.0.4. I selected "Minimum System Software for any Macintosh" and clicked Install. I got an error message saying, "There is not enough room on the disk. 52K available, 53K needed." I removed a couple of System documents and tried again. I got the same message, except this time it said, "83K available, 84K needed".

I removed more files from the System Folder on the CD Installer disk. This time the installation proceeded without giving the error message.

Also, during the disk-swapping process (I was working on a single-floppy system), there were two dialog boxes showing at the same time--one said to insert the "CD Installer Disk"; the other said to insert the "System Tools" disk.

I was able to complete the installation, but I'm curious about the problems I encountered.

Can you explain?

DISCUSSION -----

We were unable to duplicate the situation you describe. However, the latest version of the AppleCD SC software does not require the Installer. The installation software is on AppleLink. Use this path:

Developer Services  
Macintosh Developer Technical Support  
Tools  
CD-ROM

A Read Me file is also in the folder detailing changes in this release and instructions for installation.

## AppleCD SC: With Macintosh IIci & Portable Use version 3.0.1

Revised: 8/21/91  
Security: Everyone

AppleCD SC: With Macintosh IIci & Portable Use version 3.0.1

=====

Article Created: 13 March 1990  
Article Last Reviewed: 20 August 1991  
Article Last Updated: 20 August 1991

TOPIC -----

When will the Foreign File Access problems with the Macintosh IIci be corrected?

DISCUSSION -----

Version 3.0.1 or later of the AppleCD SC software is fully compatible with the Macintosh IIci, Portable, and previous Macintosh models. Version 3.2 is now available for use under System 6.0.7, 6.0.8, or 7.0 with all current Macintosh models.

Below is a table of the CD Setup files and their version numbers for the latest release, version 3.2.

|                         |       |
|-------------------------|-------|
| AppleCD SC Setup Files  | 3.2   |
| -----                   | ----  |
| Apple CD-ROM            | 2.0   |
| CD Remote INIT          | 1.1   |
| CD Remote DA            | 1.1   |
| Foreign File Access     | 1.0.1 |
| Audio CD Access         | 1.1   |
| High Sierra File Access | 1.0   |
| ISO 9660 File Access    | 1.0   |

AppleCD SC Setup software is available via AppleLink. To locate it, use the BB Pathfinder in the AppleLink Information icon and search on "CD SC Setup".

## VAX/VMS and TCP/IP Questions and Answers

Revised: 6/29/90  
Security: Everyone

VAX/VMS and TCP/IP Questions and Answers

=====

This article last reviewed: 13 March 1990

TOPIC -----

- 1) Can someone running Telnet and using MacTCP or Telnet's the built-in communications on a LocalTalk Macintosh, communicate with a host on Ethernet through an AppleTalk Internet Router?
- 2) Can someone on a Macintosh using Telnet (with or without MacTCP) communicate with a VAX running VMS? Do you need other software on the VAX so that it can "speak" TCP?

DISCUSSION -----

- 1) The user will not be able to communicate with the host without a DDP/IP gateway for this reason:

A DDP/IP gateway is a device that takes the AppleTalk-encapsulated IP packets from LocalTalk and decapsulates them. This device (such as the FastPath) then broadcasts them onto Ethernet as IP packets. The AppleTalk Internet Router is not a DDP/IP gateway and is not capable of this.

It is important to note that MacTCP 1.0 will not work across a router, AppleTalk Internet Router included, if class C IP addressing is being used. Class A and class B addressing work properly. If the user needs to use Class C addressing, please contact us for a temporary fix.

- 2) If the Macintosh is on LocalTalk, the user will need a DDP/IP gateway as explained above. If it is on Ethernet, the DDP/IP gateway is not needed. The VAX running VMS needs to run a communications package that supports TCP/IP. Digital Equipment Corporation distributes Network Research Corporation FUSION TCP/IP and the Wollongong Group's WIN/TCP and WIN/TCP-DDN through the Digital Distributed Software (DDS) program. Another example is the TCP/IP software for VAX/VMS by Process Software.

## File Server: Dial-Back Access and Security

Revised: 6/29/90  
Security: Everyone

File Server: Dial-Back Access and Security

=====

This article last reviewed: 19 March 1990

TOPIC -----

Do you know of a dial-back verification system for dialing into an AppleTalk network? I want remote access to a file server and as much security as possible for this type of access. I know of Liaison and Shiva NetModems, but I'm not sure what is available for dial-back security and user verification.

DISCUSSION -----

Both Liaison and Shiva NetModems offer dial-back network access as a part of the software. For address information, check the Tech Info library under "Liaison" and "Shiva NetModem."

## System 6: Installing Fonts Into a Locked System File (11/94)

Revised: 11/17/94  
Security: Everyone

System 6: Installing Fonts Into a Locked System File (11/94)

Article Created: 19 March 1990  
Article Reviewed/Updated: 17 November 1994

TOPIC -----

A customer was able to install fonts in a System file that had been locked from the desktop. He said that the installation appeared normal until he quit and entered an application to use the new font. The font was not there, so he quit and tried to restart his machine. It simply gave him the "?" icon and refused to start up. The failed installation apparently resulted in a seriously corrupt System file, and he had to reinstall the System Software. He had no indication of a problem during the installation.

Does the Font/DA Mover check for a locked System file? Is there any way that a user can install fonts or DAs in a locked System file?

DISCUSSION -----

We tried to install a font and DA in a locked (via the "Get Info" dialog) System file and received an ID= -61 error. This error number indicates a write-permission error and that the Font/DA Mover attempted to write to a file that was locked. The Font/DA Mover does not check for a locked System file but does check for an error when attempting to write to a file.

With System 6, it is best to check that the System file is unlocked before installing any fonts or desk accessories.

## Burst Mode: Motorola Term for Fast Access to RAM (11/94)

Revised: 11/17/94  
Security: Everyone

Burst Mode: Motorola Term for Fast Access to RAM (11/94)

=====

Article Created: 19 March 1990  
Article Reviewed/Updated: 17 November 1994

TOPIC -----

Is there another name for "Burst Mode RAM access"?

DISCUSSION -----

The Motorola MC68030 Enhanced 32-Bit Microprocessor User's Manual uses the term burst mode for its fast access to RAM process. There is no other terminology used for this process.

Burst mode is described in section 7, pages 49 through 51, and section 12, pages 13, 16, and 17 of the manual.

## Apple IIGS: Moire Pattern Appears at Startup (11/94)

Revised: 11/17/94  
Security: Everyone

Apple IIGS: Moire Pattern Appears at Startup (11/94)

=====

Article Created: 19 March 1990  
Article Reviewed/Updated: 17 November 1994

TOPIC -----

My Apple IIGS is showing a moire pattern on the desktop during startup. This occurs on a current model Apple IIGS and not on earlier versions. The VGC chip on the troublesome model is 344S0046-4. The effect fades if the brightness is turned to maximum. It is more obvious if the brightness is set low. Have you noticed this problem?

DISCUSSION -----

This moire pattern appears to be an interaction between the frequency of the dithering process being used to create the desktop color and the horizontal scanning frequency.

As you noticed, if you increase either the brightness or the contrast, the visibility of the pattern is reduced. Also, if you adjust the vertical size of the display, the pattern becomes harder to see.

Although this may be bothersome, it will not affect productivity nor is it indicative of an impending failure.

## Macintosh IIci: PageMaker and Video Card ROM Problem/Solution

Revised: 12/12/90  
Security: Everyone

Macintosh IIci: PageMaker and Video Card ROM Problem/Solution

=====

This article last reviewed: 11 December 1990

TOPIC -----

PageMaker users using the Macintosh IIci with a Portrait Display Video Card or Two-Page Monochrome Monitor Video Card have been reporting display problems: incorrect character and word spacing, incorrect registration of line breaks between the screen and printed output, and reduced performance. Certain versions of the video card ROMs exhibit the problem while other versions don't. As a result, switching between a "good" card and the built-in video on a Macintosh IIci yields different results on the screen.

DISCUSSION -----

Here's the solution of the Aldus PageMaker/video card problem. The problem relates to the configuration information carried in the video card ROM (and the video portion of the Macintosh IIci CPU ROM) and the way QuickDraw and PageMaker use this information. Each display in a Macintosh II carries a fixed-point representation of the horizontal and vertical pixel resolution in dots-per-inch. Because QuickDraw is an integer-based drawing system, it does not attempt to scale its object rendering to match this reported screen resolution. Instead, it assumes 72.0 dpi, which is the nominal resolution for the classic Macintosh and the 12-inch, high-resolution monitors.

The video software specifications (which also apply to third-party developers) have been updated to recommend that video configuration ROMs reflect the true screen resolution of the displays it supports. Although 32-Bit QuickDraw continues to ignore the resolution fields, all video hardware released since 32-Bit QuickDraw introduction includes appropriate resolution information; specifically, 80.0 dpi for the Portrait Display and 77 dpi for the Two-Page Monochrome Monitor. This applies to a post-introduction revision of the Portrait Display and Two-Page Monochrome Monitor Video Cards and to the Macintosh IIci built-in video software.

The problem is that PageMaker uses these resolution fields to scale font width

tables for screen display based on a traditional low-memory global. This global is updated by the QuickDraw setup code to reflect the screen resolution of the main screen (the screen with the menu bar). The line-spacing problems happen because PageMaker scales the font widths, while QuickDraw and the Font Manager do not. The problems are not directly related to the video hardware or the CPU ROMs.

#### Solution

-----  
Upgrade to PageMaker 4.0, which takes into account QuickDraw's behavior with screen fonts. The problem described in this article applies only to PageMaker versions earlier than 4.0.

#### Other Notes

-----  
Many applications that run on both Color QuickDraw and Classic QuickDraw machines look at a collection of low-memory globals to determine system configuration. Although every effort has been made to keep these low-memory globals compatible with their original intent, many of them have become obsolete in a multiscreen/multidepth world. It is likely that other applications may display similar problems, particularly those programs with highly customized code for printing or other device-independent imaging.

#### Affected Revisions

-----  
All 68000-based Macintoshes (Plus, SE, and Portable) always report 72.0 dpi resolution and should not exhibit any problems.

Macintosh II Video Card: always reports 72.0 dpi

Macintosh II High-Resolution Video Card: always reports 72.0 dpi

Macintosh Monochrome Video Card: always reports 72.0 dpi

Macintosh SE/30 Built-In Video: always reports 72.0 dpi

Macintosh II Portrait Display Card:

- ROM Part 341-0699: reports 72.0 dpi on the Portrait Display and Two-Page Monochrome Monitor
- ROM Part 341-0732 (current): reports 80.0 dpi on the Portrait Display, 77.0 dpi on the Two-Page Monochrome Monitor

Macintosh II Two-Page Monochrome Monitor Card:

- ROM Part 341-#### (all previous versions): reports 72.0 dpi on the Portrait Display and Two-Page Monochrome Monitor
- ROM Part 341-0727 (current): reports 80.0 dpi on the Portrait Display, 77.0 dpi on the Two-Page Monochrome Monitor

Macintosh IIci Built-In Video: reports 80.0 dpi on the Portrait Display,

72.0 dpi on all other displays.

## PS/2 to LaserWriter: Problem Printing From LaserWriter IINT

Revised: 6/29/90  
Security: Everyone

PS/2 to LaserWriter: Problem Printing From LaserWriter IINT

=====

This article last reviewed: 19 March 1990

TOPIC -----

I am having problems printing from my IBM PS/2 Model 30 over a LocalTalk PC Card to a LaserWriter IINT. I also have a Macintosh on the network, and it is not experiencing any printing problems.

Software includes DOS 3.3, AppleTalk PC Protocol Stack 2.0, AppleShare PC Card 2.0, Microsoft Word 5.0 (using PostScript), and DisplayWrite 4 (using Epson emulation).

The problem initially was that I couldn't print from Microsoft Word, but I fixed that. Now, I can print from either program, but when I switch from one program to the other, I have to go into the Chooser and change the printer designation. My understanding was that I should be able to set up both printer configurations (PostScript and Epson emulation) through the AppleTalk PC software, then indicate through the application which driver to use.

Am I misunderstanding the functionality of the software, or have I set up something incorrectly?

DISCUSSION -----

It sounds like you are not switching between Epson emulation and PostScript mode within the AppleShare PC Chooser. You set the DisplayWrite 4 to use its Epson driver, and AppleShare PC is set to convert the Epson Print Code from the DisplayWriter driver to PostScript code. This is called Epson emulation. You also use Microsoft Word 5.0, printing with its PostScript driver, and AppleShare PC is set to pass all printer code directly to the selected printer (PostScript mode). You cannot do both of these through the same LPT port.

Because the two applications require different LPT port modes, you need to switch the LPT port's mode from the AppleShare Chooser or with ANET commands within a batch file.

Another method would be to have all Microsoft Word print jobs go to LPT1, and all DisplayWrite jobs go to LPT2. The applications provide for designating the LPT port within their printer options. The same LaserWriter can be assigned to both LPT ports. The difference is that LPT1 has been set from within the AppleShare Chooser to PostScript mode and LPT2 has been set to Epson emulation. This can be done even though both LPT1 and LPT2 are connected to the same LaserWriter.

Alternatively, you can use a single LPT port set to Epson emulation and print using an Epson driver from both word processors.

A/UX: MaxStream Tape Drive

=====

Article Created: 19 March 1990

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Are you familiar with MaxStream from Archive? Can it be used to back up files only and not partitions from A/UX?

### DISCUSSION -----

According to Archive's technical engineering people, the MaxStream backup subsystem provides 60MB and 150MB storage-capacity drives and MaxStream backup software for both Macintosh OS and A/UX. The backup software for both the Macintosh OS and A/UX allows file-by-file and/or partition backups and restoration. The tape medium is the 5.25-inch standard, high-density DC600 tape cartridge. It has backup and restore speeds of up to 6MB per minute.

For more contact information, search the Technical Info library under "Archive Corporation."

Security: Everyone

A/UX: TTY Flow Control Settings

Article Created: 19 March 1990

### Article Change History

-----  
08/31/92 - REVIEWED  
o For technical accuracy.

### TOPIC -----

I tried to change the default settings of /dev/tty0 (and /dev/modem) to connect an additional printer. Except for setting "modem" to "-modem" and some other options, the settings did not work for "-hupcl" to "hupcl", "istrip" to "-istrip", "echo" to "-echo", "echok" to "-echok".

Can you explain?

### DISCUSSION -----

All tty flow control settings, like "-modem", "dtrflow", "-dtrflow", and so on, are maintained across last close. This means that the flow control settings are "remembered" when a tty device is closed and reopened. However, all other termio characteristics, like speed (50, 75, 1200, and so on), parity (parenb, parodd, and so on), input modes (ignbrk, brkint, istrip, and so on), and local modes (echo, echok, and so on), are set to the default settings when the tty line is closed.

To put the "stty" settings into effect and still keep the tty port open, put a sleep statement ("sleep 99999", for example) after the "stty" command.

In your case, you can use this:

```
(stty hupcl -istrip -echo -echok; sleep 99999) < /dev/tty0 &
```

Request for OS/2 Driver for DayStar's AppleTalk Card

=====

This article last reviewed: 19 March 1990

TOPIC -----

I linked DayStar Digital the following question:

Are you planning a driver to allow your MCA AppleTalk card to run in OS/2?

DISCUSSION -----

DayStar Digital responded:

As the demand continues to increase, I believe that an OS/2 driver has got to be in our future; however, it will not be the near future. We may have had 20 calls in 1989 for the driver, so we have been waiting for demand to pick up. If the last month or so is any indication, it is time for us to get to work. Regrettably, even if we find someone to do the driver now, it will probably be 6 to 8 months before its release.

## Fast Page DRAM: A Description

Revised: 7/21/92  
Security: Everyone

Fast Page DRAM: A Description

=====

Article Created: 19 March 1990  
Article Last Reviewed: 21 July 1992  
Article Last Updated:

TOPIC -----

This article describes fast page DRAM and compares it with ordinary DRAM.

DISCUSSION -----

A dynamic random access memory (DRAM) chip consists of one-bit memory cells organized in rows and columns. Each memory cell is a capacitor. This capacitor is either charged or discharged to represent a high or low state, respectively. The design's advantage is it allows very high-density memories by requiring only one transistor per bit.

However, this design has a timing bottleneck. Since the amount of stored charge is very small, it must to be amplified before being placed on the data bus. This results in a 80 to 120 nS access cycle time. However, there are methods to minimize the affect of this overhead.

With a basic DRAM design, two signal lines are alternatively strobed back and forth to access the data within the DRAM, because the address lines are shared. These signal lines are Column Address Strobe (CAS) and Row Address Strobe (RAS). The access sequence is as follows: put the row address on the bus, assert RAS, put the column address on the bus, assert CAS and then get the data.

Page DRAM has a timing sequence that eliminates the need for multiple RAS strobes when accessing data within the same row. When the chip sees one RAS strobe, multiple address and CAS strobes access the data in the same row. This type of memory access is beneficial for burst mode accesses. The first read takes the usual overhead, because one set of RAS and CAS strobes must be initiated. However, subsequent reads are shorter because the RAS line does not have to be asserted again for each data request.

Basically, fast page mode DRAM is a page DRAM with slightly different logic that allows for an even faster access time. Transparent latches are used for immediate access to the data. These latches make the data available even before the latch locks in the data. It is this additional speed that allows the "5-2-2-2" cache burst mode on the Macintosh IIci to work.

This burst mode allows the use of cost-effective DRAMs, while providing high performance. The 68030 has a four long word cache (16 bytes), which is quickly filled by the "5-2-2-2" cycle. The processor accesses data from the cache subsequently until a cache miss. Then another "5-2-2-2" cycle is done.

Fast page mode DRAM has a little more logic than a basic DRAM chip, but permits fast access to sequential data within a column at speeds required for the Macintosh IIci.

## AppleTalk Phase 2: Split Horizon RTMP

Revised: 6/29/90  
Security: Everyone

AppleTalk Phase 2: Split Horizon RTMP

=====

This article last reviewed: 19 March 1990

TOPIC -----

We have a large Internet distributed over five major hubs arranged in a star pattern. The main hub network (Network A) has a Hayes InterBridge half-bridge (using Hayes V9600 modems) to each of four other sites (Network B, Network C, Network D, and Network E). In addition to the main connection to Network A, Network D has a Hayes InterBridge half-bridge (with V9600 modems) to Network B and another to Network C. These redundant links have been working fine under AppleTalk Phase 1, and we expect them to work under AppleTalk Phase 2.

### Questions

-----

- 1) With these redundant links, will we see the benefit of the split horizon RTMP on the routers that make up this redundant link? If we highlighted the circular route that exists through the redundant links, would the routers on this path show a reduction in the size of the RTMP tables that are sent from each port of the InterBridge?
- 2) On the link to Network E, where there is no redundant link, will the size of the RTMP packets sent over the modem link be reduced versus the size of the packets under AppleTalk Phase 1? An example, assuming that there are five network numbers at Network E and 95 network numbers elsewhere in the network, AppleTalk Phase 1 would imply that there are 100 network entries in the RTMP packets sent from each end of the modem link. Would this number decrease to 95 from Network A to Network C and only five from Network C to Network A, which would, in effect, yield a reduction in overhead of 50% on this slow link?

DISCUSSION -----

- 1) Split horizon reduces the number of redundant routing table entries exchanged by routers. The split horizon algorithm is: all entries whose forwarding port in the routing table is equal to the port out that the entry

is being sent are omitted from the RTMP data packet. In other words, Router A will not include network numbers in RTMP packets broadcast on Network X when Network X is the path (forwarding port) for Router A to reach these other networks. The forwarding port is the shortest distance, in hops, from the sending router.

If there is more than one route from Network A to Network X, the router in Network A stores in its routing table the shortest distance, in hops, to Network X. If more than one of these routes is the same distance, in hops, and is the shortest distance, the router's routing table will be modified each time an RTMP packet is received from Network X via this route.

The split horizon algorithm reduces the amount of RTMP data broadcast onto the Internet. The RTMP data would be less if there were no redundant links. From what you have told us of the customer's Internet, the redundant links do not eliminate the benefits of the split horizon algorithm.

- 2) You are correct, an AppleTalk Phase 1 router would broadcast an RTMP packet that contained 100 network tuples to Network A and Network E networks. An AppleTalk Phase 2 router will broadcast an RTMP packet containing 95 network tuples on the TriCounty network and only five network tuples on Network A.

Note: Hayes has recently released a ROM upgrade for the Hayes InterBridge that is necessary for AppleTalk Phase 2 compatibility.

## LaserWriter 6.0.1: Problem Saving PostScript Files to Disk

Revised: 11/2/92  
Security: Everyone

LaserWriter 6.0.1: Problem Saving PostScript Files to Disk

Article Created: 20 March 1990  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 15 July 1992

TOPIC -----

I want to send a file for printing to the terminal server's print queue, but I can't get the Command-K or Command-F function to work using LaserWriter 6.0.1 and System 6.0.4.

When I select the print function and press Command-K, my Macintosh beeps for as long as I press the keys. Can you tell me if this function still works with the LaserWriter 6.0.1 drivers? Do these commands no longer work in these applications? Is there another way to accomplish this?

DISCUSSION -----

This feature is still present in the LaserWriter 6.0.1 drivers, but background printing must be turned off for it to work. (Note however that this feature is no longer available in System 7. Instead, there is an option in the Print dialog for generating a Postscript file to disk.)

It is also possible in this case that the Control K is being intercepted by an INIT or cdev like QuicKeys or MacroMaker.

There is an undocumented feature of the LaserWriter version 6.0.1 driver that allows saving a PostScript file to disk without resorting to the Command-F or -K method. Here is the procedure to reveal a check box in the Print dialog that saves the PostScript file to disk. You need ResEdit and a copy of the LaserWriter file. (Never use ResEdit on the original copy of a file.)

- 1) Open "LaserWriter" with ResEdit.
- 2) Open the "DITL" resource picker.
- 3) Open the DITL that has the print dialog (-8191).
- 4) From the DITL menu, select "Select dialog item".

- 5) Type "22" and click OK.
- 6) From the File menu, select "Open as dialog item".
- 7) You'll see the item has 0,0,0,0 as its rect. Set it to something like 80, 357, 100, 439 and close the window.
- 8) You'll see the "Disk File" checkbox. Resize it appropriately and move it to a convenient location.
- 9) Save changes and quit ResEdit.

Be sure to turn off Background Printing in the Chooser before printing. When you select print with the "Disk File" checkbox highlighted, you'll get a PostScript file when you click OK. This checkbox provides the same functionality as the Command-F method, which generates a PostScript file without the Laser Prep file. Remember to work with ResEdit only on a copy of the LaserWriter file.

## Kodak DataShow and Macintosh II Hi-Res Video Card

Revised: 6/29/90  
Security: Everyone

Kodak DataShow and Macintosh II Hi-Res Video Card

=====

This article last reviewed: 20 March 1990

TOPIC -----

The Kodak DataShow 480 projection pad does not work with the new video card, Macintosh II High-Resolution Video Card (661-0533). It works only with the 661-0492 card. How can I get it to work with the 661-0533 card?

DISCUSSION -----

The Macintosh II High-Resolution Video Card requires pin 4 of its video connector to be grounded. It is likely that pin 4 is not used or connected to ground in the Kodak DataShow or its cable. A simple solution is to have a new cable made that grounds pin 4. This cable can replace the current cable or be attached to the current cable as an extension.

The Macintosh II High-Resolution Video Card can switch between two video modes. Grounding pin 4 selects the standard mode. The optional video mode is an interlaced video signal and is not compatible with the Apple High-Resolution Monitors or devices like the Kodak DataShow, that are designed for the card's standard video signal output.

## Printing to Network LaserWriter: The Process

Revised: 6/29/90  
Security: Everyone

Printing to Network LaserWriter: The Process

=====

This article last reviewed: 20 March 1990

TOPIC -----

What is the process taking place when a user prints to an AppleShare Print Server (from the user to the server and from the server to the LaserWriter)?

Where does the QuickDraw-to-PostScript process taking place?

DISCUSSION -----

I will be addressing your question as a single process. The process you are asking for is the printing of graphics and text (the same thing on the Macintosh) to a PostScript printer using a network and print spooler, like the AppleShare Print Server.

The first step takes place when the user selects the Print option provided from within an application. The application has been programmed by its developer to print its documents to a PostScript printer. It provides this by using the Macintosh Print Manager Routines, which are a standard part of the Macintosh Operating System.

The application uses QuickDraw and Font Manager calls to draw to a GrafPort (display data structure). These calls create QuickDraw opcodes, which are stored in the GrafPort and converted to actual pixel information through QuickDraw low-level routines. Typically, the GrafPort controls an image displayed on a screen. The Print Manager uses a special form of GrafPort called the TPPrPort.

The TPPrPort is essentially a GrafPort that includes special data structures and drawing routines for a print driver, like the Apple LaserWriter PostScript driver. This enables QuickDraw to draw to a printer rather than a display device. QuickDraw high-level draw commands generated from the application now pass data to the selected driver. This is handled by the new low-level drawing routines, which route the data to a print driver and is generally transparent

to the application programmer and the high-level QuickDraw commands being used to draw to the TPPrPort.

The application, having been directed by the user to print a document, redraws the selected document to a TPPrPort. The Print Manager, once directed to print the document, activates the currently-selected print driver. The print driver, previously selected through the Chooser, has its name stored in Parameter RAM and an access identifier stored in the Device Manager's unit table. The Print Manager uses the Device Manager to load the chosen print driver.

After the print driver loading process is completed, the driver tries to use the AppleTalk Manager to contact the LaserWriter. In the case of an AppleShare Print Server, where the desired LaserWriter has been "captured", the print server answers back to the driver that it is ready.

When the Macintosh Print Server bypass option is selected, the real LaserWriter does not appear as an option in the Chooser because during the capture phase of the print server, the LaserWriter device type has been changed to answer only to a special name. Essentially, the LaserWriter doesn't know it's a LaserWriter and calls itself something else. When searching for LaserWriters, the Chooser displays the names of network entities that answer back, when it searches for network devices of the type "LaserWriter." A print server with a captured LaserWriter answers the Chooser's AppleTalk lookup with the name of the captured LaserWriter.

The print driver within the user's Macintosh receives an answer from the print server that it is the selected LaserWriter and is ready to receive a print job. The print driver passes this information to the Print Manager, which passes on this information as a "No Error" to the application. After receiving a "No Error", the application creates the document for printing. The application draws each page to the printer document using QuickDraw commands.

The print driver receives each of the pages as QuickDraw-generated opcodes and converts these opcodes to PostScript language commands and passes the data to the driver. The driver passes the information through its Printer Access Protocol routines to the AppleTalk Manager, which, in turn, delivers the data across whatever physical AppleTalk network is connected to the user's Macintosh to the print server.

The print server receives the PostScript commands through the AppleTalk Manager and the governing Printer Access Protocols. The PostScript commands are stored to disk, and the document is placed in a print queue. The print driver in the System Folder of the print server is accessed through the Print Manager routines on the print server.

The print server acts as an application that directly passes the PostScript code received from the user's Macintosh to the driver. The driver contacts the "real" LaserWriter and sends the PostScript data through the AppleTalk Manager, adding a set of its own Special PostScript routines prior to printing the job. These special routines let the print server keep track of the document name, number of pages, and any errors generated by the LaserWriter.

This is an overview of the process involved when printing to a print server and

captured LaserWriter. Of course, the AppleTalk phase itself can be greatly complicated when routers are involved, and many parts of the process have been simplified here.

## Macintosh: How To Access DOS EIS Application

Revised: 6/29/90  
Security: Everyone

Macintosh: How To Access DOS EIS Application

=====

This article last reviewed: 21 March 1990

TOPIC -----

I want to run a DOS application from a Novell server. The application is an Executive Information System (EIS), which exists on a Novell server on Token Ring. It requires EGA graphics.

I plan to put a LocalTalk PC Card into a 386-based DOS machine. This machine already has a Token Ring card to connect it to a Novell server. I would like to run the Novell drivers and the necessary parts of the AppleShare PC package, along with PCAnywhere from Digital Microprocessor Associates on the DOS machine. On the Macintoshes, I want to run PCMacTerm (also from Digital Microprocessor Associates), which lets the Macintoshes act as terminals to the DOS machine.

Can we run the Novell drivers, the appropriate AppleShare drivers, the Token Ring card, and the LocalTalk PC Card in the DOS machine and still have enough memory left to run the application? Can we run the Token Ring and LocalTalk PC Cards together in the DOS machine and access both services?

DISCUSSION -----

Basically, it sounds like you want a Macintosh to gain access to a DOS EIS application running on a Novell Server, via a "PC Gateway". Conceptually, this sounds feasible. However, it would be prudent to test this configuration.

From a memory standpoint, you should be okay. The AppleShare PC software can be pared to 50K or so. The Novell software requires a little more room, perhaps as much as 80K or 90K. Those memory requirements combined with DOS (roughly 100K) still leaves 400K (640-50-90-100=400) for the application.

Even if you do run short of memory, third-party cards and programs may help you work around the limitation. Two such products are HiCard and MOVE'EM (information on each is in the Tech Info Library).

The minimum AppleShare PC drivers needed are LSL.COM, LTALKP.COM, ATALK.COM, and COMPAT.COM.

## Display Card 4/8 and 8/24 Specifications (Discontinued)

Revised: 6/20/94  
Security: Everyone

Display Card 4/8 and 8/24 Specifications (Discontinued)

=====

TOPIC -----

This article gives specifications for the Display Card 4/8 and 8/24.

DISCUSSION -----

### System Requirements

-----

To use the Macintosh Display Card 4/8 or Macintosh Display Card 8/24, you'll need a personal computer in the Macintosh II family with an available NuBus slot and System Software Version 6.0.5 or later. For Macintosh II, IIX, and IICX, you'll need 32-bit QuickDraw software to run 24-bit color applications. To take advantage of full 24-bit color, Apple recommends a minimum of 2 megabytes of RAM.

### Technical Specifications

-----

#### Interface

- NuBus; plugs into any Macintosh II slot
- NuBus slave block transfer modes supported

#### Connector

15-pin D-style

#### Display modes

- 1, 2, 4, 8, or 24 bits per pixel (2, 4, 16, 256, or 16.7 million colors)
- Software-selectable

#### Display resolution

- Up to 1,152 pixels horizontally by 870 pixels vertically, depending on the resolution of the display
- Auto-configuring

#### Apple Convolution

# ..TIL05422-Display\_Card\_4-8\_and\_8-24\_Specifications\_Discontinued.pdf

- Convolution available for RS-170 interlaced video to up to 8 bits per pixel (256 colors) on the Macintosh Display Card 8/24

## Color lookup table

- In 24-bit mode, provides direct access to 16.7 million colors, driving 8-bit DACs (digital-analog converters) for each of the three RGB channels
- In other modes, provides a palette of up to 256 colors out of 16.7 million

## Output signals

- Modes: RGB (analog) and gray scale
- Video: RS-343 standard. Supports RS-170 timing standard for interlaced video with overscan and underscan modes.
- Sync: Separate or composite depending on display resolution; negative-going; TTL

## Raster rates

- Variable raster rates under software control
- Vertical refresh: 66.7 or 75 hertz depending on display resolution
- Dot clock: 12.2727, 30.24, 57.2832, or 100 megahertz depending on display resolution

## Power consumption

7 watts

## DISPLAY MODES SUPPORTED

## Display Card 8•24 GC: Specifications (Discontinued)

Revised: 9/14/93  
Security: Everyone

Display Card 8•24 GC: Specifications (Discontinued)

=====  
This article last reviewed: 21 March 1990

TOPIC -----

This article give specifications for the Display Card 8/24 GC.

DISCUSSION -----

Display Card 8/24 GC Specifications

System Requirements

-----  
To use the Macintosh Display Card 8/24 GC, you'll need a personal computer in the Macintosh II family with an available NuBus slot, System Software Version 6.0.5 or later, and a minimum of 2 megabytes of memory. For the Macintosh II, IIX, and IICX, you need the 32-bit QuickDraw software to run 24-bit color applications.

Technical Specifications

-----  
Graphics coprocessor

Advanced Micro Devices Am29000 RISC-based processor running at 30 megahertz.

On-board memory

2 megabytes of VRAM used as display frame buffer and processor instruction memory, which can be expanded via SIMM sockets with the Macintosh Display Card DRAM Expansion Kit to hold an additional 2 megabytes of DRAM, for processing of large off-screen graphics. You can expand memory up to 8 megabytes via third-party SIMMs. 64 kilobytes of SRAM used as processor instruction cache.

Display modes

1, 2, 4, 8, or 24 bits per pixel (2, 4, 16, 256, or 16.7 million colors), software-selectable.

Display resolution

Up to 1,152 pixels horizontally by 870 pixels vertically, depending on display

resolution, auto-configuring.

#### Apple Convolution

Convolution available for RS-170 interlaced video to up to 8 bits per pixel (256 colors).

#### Interface

NuBus; plugs into any Macintosh II slot with NuBus master and slave block transfer modes supported.

#### Connector

15-pin D-style

#### Color lookup table

- In 24-bit mode, provides direct access to 16.7 million colors, driving 8-bit DACs (digital-analog converters) for each of the three RGB channels
- In other modes, provides a palette of up to 256 colors out of 16.7 million

#### Output signals

- Modes: RGB (analog) and gray scale
- Video: RS-343 standard. Supports RS-170 timing standard for interlaced video with overscan and underscan modes.
- Sync: Separate or composite depending on display resolution; negative-going; TTL

#### Raster rates

- Variable raster rates under software control
- Vertical refresh: 66.7 or 75 hertz depending on display resolution
- Dot clock: 12.2727, 30.24, 57.2832, or 100 megahertz depending on display resolution

#### Power consumption

20 watts (In systems with all NuBus slots utilized, the power requirements of all cards installed should be added together to ensure that the NuBus power draw is not exceeded. For more information, see the Macintosh owner's guide.)

#### DISPLAY MODES SUPPORTED

| Display                                  | Macintosh Display Card 8/24 GC                            |
|------------------------------------------|-----------------------------------------------------------|
| Apple High-Resolution Monochrome Monitor | 640 x 480 pixels<br>2, 4, 16, or 256 gray levels          |
| AppleColor High-Resolution RGB Monitor   | 640 x 480 pixels<br>2, 4, 16, 256, or 16.7 million colors |
| Apple Macintosh Portrait Display         | 640 x 870 pixels<br>2, 4, 16, or 256 gray levels          |
| Apple Two-Page Monochrome Monitor        | 1,152 x 870 pixels<br>2, 4, 16, or 256 gray levels        |

# ..TIL05423-Display\_Card\_8-24\_GC-Specifications\_Discontinued.pdf

|                          |                                              |
|--------------------------|----------------------------------------------|
| Interlaced video devices | 640 x 480 pixels                             |
|                          | 2, 4, 16, 256, or 16.7 million colors        |
|                          | (Apple Convolution enabled up to 256 colors) |

## A/UX 2.0 Specifications (Discontinued)

Revised: 6/20/94  
Security: Everyone

A/UX 2.0 Specifications (Discontinued)

Article Created: 3 April 1990

TOPIC -----

This article gives specifactions for A/UX 2.0.

DISCUSSION -----

### System Requirements

-----  
To use the Apple A/UX operating system Version 2.0, you'll need:

- One of the following personal computers-
  - Macintosh SE/30
  - Macintosh II with an Apple Paged Memory Management Unit (PMMU)
  - Macintosh IIX
  - Macintosh IICX
  - Macintosh IIci
  - Macintosh IIfx
- A minimum of 4 megabytes of RAM.
- An Apple hard disk (minimum 80 megabytes) or the equivalent.
- An Apple monitor (or equivalent) that is compatible with A/UX Version 2.0.
- For Ethernet compatibility, the Apple EtherTalk NB Card or the equivalent.

Optional Equipment includes additional memory and the AppleCD SC drive.

### Technical Specifications

#### ----- Portability standard

- AT&T UNIX System V, Release 2, Version 2.
- Compliant with the System V Interface Definition (SVID); passes the System V Verification Suite (SVVS).

## ..TIL05424-A-UX\_2-0\_Specifications\_Discontinued.pdf

- BSD 4.3 extensions, including signals, job control, groups, sockets, Berkeley Networking Services, subnets, and Berkeley File System.
- Compliant with FIPS #151.
- Compliant with IEEE POSIX 1003.11988 FUS.

### Applications supported

- Macintosh applications that adhere to Inside Macintosh specifications.
- AT&T and BSD UNIX applications.
- X Window System applications (with add-on package).
- Hybrid applications (UNIX applications using the Macintosh Toolbox).

### Macintosh Look and Feel

- Macintosh MultiFinder environment.
- Macintosh-style startup and shutdown.
- Support for 32-bit Color QuickDraw.

### UNIX integration

- UNIX command builder.
- UNIX shell windows.
- Mouse-driven editing.
- X Window System support (add-on).
- Cut-and-paste text editing.
- Printer and AppleShare file server selection through the Chooser.

### UNIX command-line interpreters for UNIX shell windows

- Bourne Shell.
- Korn Shell.
- C Shell.

### Development tools

- Editing and processing utilities (Macintosh mouse editor, vi, ex, ed, ditroff, nroff, tbl, eqn, and pic).
- Assembler and C compiler.
- Shared libraries.
- Lint, lex, yacc.
- Debuggers (abd, sdb, MacsBug).
- Linker (ld).
- Source control (SCCS, make, and other UNIX tools).

### Communications

- TCP/IP over Ethernet or over serial connection (SL/IP).
- AppleTalk printing and file sharing client services via LocalTalk or EtherTalk.
- Transparent file sharing over Ethernet or serial lines using NFS Version 3.2.
- Remote log-in and execution, resource sharing, file transfer, and electronic mail with Berkeley Networking Services (from BSD 4.3).
- Domains and subnets.
- X Window System for A/UX (add-on).

### Highlights of Hardware Supported

- All Macintosh II personal computers and the Macintosh SE/30.
- Apple 20-, 40-, 80-, and 160-megabyte hard disk drives.

# ..TIL05424-A-UX\_2-0\_Specifications\_Discontinued.pdf

- Apple 400K, 800K, and 1.44-megabyte floppy disk drives.
- AppleCD SC drive.
- LaserWriter IINT, LaserWriter IINTX, and LaserWriter Plus printers;  
ImageWriter  
II and ImageWriter LQ printers.
- All Macintosh monitors and compatible third-party monitors.
- All domestic Macintosh keyboards and nonextended European Macintosh keyboards  
(function keys not supported).

## System administration

- Autorecovery.
- Autoconfiguration.
- Scripts for system administration functions.

## Article Change History

## Apple II High-Speed SCSI Card: Description (2/97)

Revised: 3/3/97  
Security: Everyone

Apple II High-Speed SCSI Card: Description (2/97)

=====

Article Created: 03 April 90  
Article Reviewed/Updated: 28 Feb 1997

TOPIC -----

This article describes the Apple II High Speed SCSI Card.

DISCUSSION -----

The new Apple II High-Speed SCSI Card provides faster data transfer primarily because of a new feature called "direct memory access" (DMA) data transfer. Data is transferred directly between the computer's memory and the SCSI peripheral, with minimal interaction from the computer's microprocessor. The result is improved, data-transfer performance. With the new high-speed card, data transfers at a rate of up to 1MB per second on the Apple IIGS computer, and up to .5MB per second on the Apple IIe computer. In addition to DMA, the SCSI manager and firmware have been improved and also contribute to the increased performance.

Compatible with all SCSI peripherals, the Apple II High-Speed SCSI Card requires only that device-specific applications and drivers be installed on the system. The card ships with drivers and applications for hard disk and CD-ROM drives, so that users can take advantage of these devices immediately. Device drivers for the tape backup drive and scanner will be made available to developers. Users will be able to take advantage of these devices as applications are developed. In addition, the new card enables users to connect as many as seven SCSI peripherals to their computer.

Another feature of the card is an on-board terminator, which simplifies setup when connecting SCSI peripherals to the computer. Previously, the Apple II SCSI Card required users to understand rules regarding placement and quantity of terminators between SCSI devices. With the new card, you place one terminator at the end of the chain of SCSI devices.

The Apple II High-Speed SCSI Card also includes improved, hard-disk utilities. These utilities make it easy to handle hard-disk management tasks, like data

backup, disk partitioning and disk verification. The partition and verify utilities take advantage of the improved firmware commands for hard disk drives. The backup utility can now handle the resource forks that are part of the IIGS files. Because these are ProDOS utilities, they can be used by both Apple IIe and Apple IIGS users.

As far as system requirements, the Apple II High-Speed SCSI Card works on an Apple IIGS computer or an Apple IIe computer with a 65C02 microprocessor. The Apple IIGS requires a 3.5-inch disk drive, while the Apple IIe requires either a 5.25- or a 3.5-inch disk drive. Both require a device with a SCSI port, appropriate SCSI cabling and one SCSI terminator.

## System 6.0.5: Technical Information

Revised: 6/29/90  
Security: Everyone

System 6.0.5: Technical Information

=====

This article last reviewed: 24 April 1990

### DETAILS OF SYSTEM 6.0.5

This document provides technical information on System 6.0.5. This information is intended for technically knowledgeable users; it is not needed to operate the Macintosh.

System 6.0.5 is required when using any of the following products: Macintosh IIfx, Macintosh Display Cards 8/24 and 8/24 GC, and third party software or hardware products that require System 6.0.5 (these third party products carry the label requires 6.0.5 or later on the outside of their packaging). In addition, Apple recommends using System 6.0.5 with any of the following products: Macintosh Portable, Macintosh IIfx, and 32 Bit QuickDraw.

The recommended version of HyperCard for use with System 6.0.5 is HyperCard 1.2.5.

### IMPROVEMENTS FOR ALL MACINTOSH MODELS

- Floppy disk initialization is more reliable during LocalTalk or hard disk activity.
- Communications applications no longer drop characters when changing monitor settings.
- The following improvements were made to MacroMaker: playback now works properly with more applications; switch-launching works; and problems pulling down menus no longer occur.
- Creating a screen shot works properly when using a color video card that requires 32-Bit QuickDraw.
- Apple HD SC Setup now erases all data when initializing (or erasing) any Apple hard disk.

#### IMPROVEMENTS FOR MACINTOSH PORTABLE

- Excessive drain on battery life caused by LocalTalk activity is eliminated.
- Occasional problems communicating with an AppleShare server are corrected.
- Devices connected to the modem or printer port work properly after coming out of system sleep.
- High speed (57.6K baud) communications with the modem port work during floppy disk activity.
- International and nonstandard U.S. keyboards no longer revert to the standard U.S. keyboard layout after coming out of system sleep.

#### IMPROVEMENTS FOR MACINTOSH IIfx

- Communications applications perform properly when transmitting or receiving the Break signal or when hardware handshaking flow control is used.
- International and music font characters are drawn correctly.
- Screen dimmers work properly with color video cards that require 32-Bit QuickDraw.

#### IMPROVEMENTS TO 32-BIT QUICKDRAW 1.2

- You can automatically upgrade 32-Bit QuickDraw to version 1.2 (only if a previous version of 32-Bit QuickDraw is present) by selecting "Easy Install".
- 32-Bit QuickDraw 1.2 does not work with system software versions previous to 6.0.5.
- The 32-Bit QuickDraw icon does not appear in color on the Macintosh IIfx or Macintosh IIfx. These models have 32-Bit QuickDraw in ROM, and System 6.0.5 contains patches that make the ROM version equivalent to 32-Bit QuickDraw 1.2.
- Performance is improved for many drawing operations.
- The contents of color windows that span multiple monitors are drawn better.
- Color icons now draw properly on all monitors.
- 32-Bit QuickDraw works with more third party printers.
- Some third party screen shot utilities work better with 32-Bit QuickDraw.
- The lasso and paint bucket tools from some paint applications now work properly on monitors set for "Thousands" of colors.

#### IMPROVEMENTS FOR MACINTOSH SE

- Apple File Exchange works properly with one megabyte of RAM and two floppy disk drives.

Article Last Updated:

### TOPIC -----

The Macintosh IIci represented one of the most significant steps forward in the evolution of the Macintosh architecture since the introduction of the original Macintosh II. Whenever a product with as many significant architectural enhancements as the Macintosh IIci is introduced, incompatibilities are bound to be revealed.

### DISCUSSION -----

The Macintosh IIci was not only the first Macintosh with a higher clockspeed and built-in video, it was also the first system with 32 bit QuickDraw in ROM and the first system to utilize non-contiguous memory and the PMMU for memory addressing. These were all significant internal modifications, intended to strengthen the Macintosh architecture and provide even greater flexibility for future hardware and software developments.

The majority of the modifications that third-party developers had to make to support the Macintosh IIci were changes that were necessary to support future CPUs and future versions of the Macintosh operating system.

- Addressing changes necessary to support non-contiguous memory and the utilization of the PMMU were changes that would be required to run correctly with VM in System 7.0.
- 32-bit QuickDraw will be built into all future ROM's which offer color support.
- The Built-in video monitor identification scheme will be built into future CPUs and is also part of our new video cards.

- Changes to the ADB manager and the video configuration (i.e. gamma correction table) will both be included in future systems.
- And, the fact that Apple will design systems that run at greater than 16Mhz is obvious.

For more information, see the four-part article on Macintosh IIcx compatibility problems.

TOPIC -----

This is part one of a four part article detailing the changes which caused the compatibility problems the Macintosh IIci faced. A significant number of Macintosh IIci compatibility problems were related to the improvements outlined below. Keep in mind that the majority of applications were not affected by these changes and that most of those that were have been updated.

DISCUSSION -----

Leading Causes for Macintosh IIci Incompatibilities

### 1) Non-contiguous memory

On all Macintosh systems prior to the Macintosh IIci physical memory is represented as one "contiguous" range of addresses. Despite the fact that memory is typically located in two separate banks with separate physical address ranges, these two ranges are presented as one "contiguous" range. The knitting together of bank A and bank B is taken care of by the memory controller. During startup the memory controller determines the amount of memory in bank A (i.e. 1MB or 4MB in case of Macintosh II) and then maps the starting address of the bank B range on top of the final address of the bank A range, which makes the two physical address ranges contiguous.

Making memory's physical addresses contiguous allows the contiguous logical memory map which is presented to software to be identical to the physical memory map. All Macintosh systems up to the Macintosh IIci utilized this 1:1 translation which means that starting at address 0, all logical and physical addresses are the same and an application knows where in physical memory an address is located.

On the Macintosh IIci the lowest physical address of bank B is fixed at physical address \$0400 0000, regardless of where the highest physical address of bank A is located. This leaves a gap between the top of bank A and the bottom of bank B which is a condition referred to as non-contiguous.

The move to non-contiguous physical memory on the Macintosh IIci was made to reduce the clock cycles associated with address translation and provide greater flexibility when configuring the system. By making physical memory non contiguous you may have as many banks of memory as you like and you can put whatever density RAM in whichever bank you like.

Non-contiguous memory requires the use of the PMMU on the 68030. The PMMU performs a translation of logical to physical addresses which permits the two to be different. And, in fact on the Macintosh IIci they are different. The address ranges of the two RAM banks are made logically contiguous even though the physical address ranges of the two banks are not contiguous. The PMMU plays the role of a dispatcher. On the one side it is accepting logical address requests made by software. On the other side it is mapping these logical address requests to physical locations in RAM.

This means that the operating system must keep track of the physical location it assigns a particular logical address. It also means that an application no longer knows where a given logical address is located in physical memory. While this change did not have an impact on most developers, it did have an impact on Nubus master card developers.

A Nubus master card is any Nubus card which possesses the intelligence necessary to take over either Nubus or the CPU bus. Examples of Nubus master cards include communications co-processor cards (i.e. Apple's MCP card), high-end video overlay and graphics cards, and intelligent I/O cards (i.e. DSP or SCSI DMA). One of the standard operations a Nubus master card performs is the reading and writing of data stored in the CPU's main memory.

When a Nubus master card wants to utilize main memory it must create a buffer within main memory, which it requests from the memory manager. This request specifies not only the size of the buffer but also that it be contiguous, non-cacheable and non-relocatable. In all Macintosh II systems before the Macintosh IIci, after the memory manager returned a logical address range that met these criteria the Nubus master card could immediately begin directly addressing physical memory. This was possible because in all designs up to the Macintosh IIci a given logical address range had an identical physical address range, which meant that a Nubus Master card could determine the location of the physical addresses by virtue of the logical address range it was provided.

With the Macintosh IIci design a Nubus master card must take some additional steps before it can begin accessing physical memory. The first step is the same, the card requests a contiguous, non-cacheable and non-relocatable chunk of memory from the memory manager, and in turn the

memory manager will return a logical address range. However on a Macintosh IIci, because the logical addresses are not the same as the physical addresses the master must make two additional requests. First, it must request that in addition to the logical address range being contiguous, the physical address range must also be contiguous. Second, it must request the location of the physical address range. Only after these requests are returned may the Nubus master begin to access physical memory directly. These two additional steps meant that all Nubus master card developers were forced to re-write their drivers to work with the Macintosh IIci.

TOPIC -----

This is part two of a four part article detailing the changes which caused the compatibility problems the Macintosh IIci faced. A significant number of Macintosh IIci compatibility problems were related to the improvements outlined below. Keep in mind that the majority of applications were not affected by these changes and that most of those that were have been updated.

DISCUSSION -----

Leading Causes for Macintosh IIci Incompatibilities (Con't)

### 2) Utilization of the PMMU - No invalid addresses

Another change related to the utilization of the PMMU in the Macintosh IIci memory addressing architecture is the rejection of invalid addresses. This is perhaps the most prevalent cause for software compatibility problems on the Macintosh IIci. As described above the PMMU plays a critical role in interfacing between logical and physical memory. As part of the process of translating logical to physical, the PMMU also evaluates the "validity" of the logical address requests it receives. An address is considered valid if it falls within the valid address range and the valid address range is determined by how much physical memory is available. A 2MB configuration has a 2MB valid address range and a 5Mb configuration has a 5MB valid address range. This is determined at startup, and the PMMU tables are set accordingly. If an application requests access to an address that lies outside of this range, the PMMU generates a bus error. That all sounds logical. So why should this cause a problem?

Because on previous systems invalid addresses were not identified. When

an application requested access to an address it would go straight to RAM, which would decode whatever bits within the address it could and ignore the rest. For instance if you had 1MB of RAM installed, your valid address range would theoretically include all addresses up to 20 bits wide (2 to the 20th is 1024K), which means that memory would only be capable of decoding up to 20 bits of address information. Now let's say an application requests access to a 21 bit address that is beyond your 1 MB address range. On all systems up to the Macintosh IIci, RAM decodes the lowest 20 bits (ignoring the 21st bit) and grants access to an address within the valid address range. The fact that a bad address had been written was concealed. There is the potential for problems with this model if an application overwrites data stored in a particular address or it reads in bad data, but often the problem is never revealed.

In the case of a Macintosh IIci this errant behavior is always revealed and therefore a number of applications, CDEVs, INITs, and drivers that worked fine up until the Macintosh IIci suddenly broke. Embarrassingly enough, this change revealed problems with two internally developed Apple products, version 3.0 of the CD-ROM driver and version 2.3 of MacTerminal.

The majority of developers who have encountered this problem are aware of it and have either already made the corrections or are in the process of making corrections necessary to make their applications Macintosh IIci compatible. However this problem, which is difficult to diagnose, took many developers by surprise.

IMPORTANT NOTE: It is important to understand that both the move to non-contiguous memory and the utilization of the PMMU to capture invalid addresses presaged changes that were required for compatibility with System 7.0 and virtual memory.

TOPIC -----

This is part three of a four part article detailing the changes which caused the compatibility problems the Macintosh IIci faced. A significant number of Macintosh IIci compatibility problems were related to the improvements outlined below. Keep in mind that the majority of applications were not affected by these changes and that most of those that were have been updated.

DISCUSSION -----

Leading Causes for Macintosh IIci Incompatibilities (Con't)

### 3) 32 bit QuickDraw in ROM

The Macintosh IIci is the first CPU to incorporate 32-bit QuickDraw in ROM. With previous systems users had the option of installing 32-bit QuickDraw in RAM through the addition of an INIT file to their system folder. Although 32-bit QuickDraw was engineered for high compatibility with the original QuickDraw and Color QuickDraw programmer's interfaces, certain programming practices could lead to problems with this new software. Users of the 32-bit QuickDraw INIT could optionally deactivate the software if there proved to be a compatibility problem. Because 32-bit QuickDraw is in ROM on the Macintosh IIci, it cannot be defeated.

- Video card problems

Generally, existing video cards have no compatibility problems with 32-bit QuickDraw. However, newer cards designed to take advantage of 32-bit QuickDraw's features such as 16 and 32-bit direct color pixels and large frame buffers need to follow a special initialization sequence at startup

to allow the card's special features to be activated after the 32-bit QuickDraw INIT has been loaded. On the Macintosh IIci, 32-bit QuickDraw (and the new Slot Manager) are in ROM, so a simpler, but different, startup sequence needs to be executed. Some third-party developers unaware of this alternate sequence were incompatible with the Macintosh IIci when it was first introduced.

- Software Problem

One major change in 32-bit QuickDraw is that the frame buffer memory is always accessed in 32-bit addressing mode rather than the 24-bit addressing mode used by previous versions of QuickDraw. This allows the applications to access frame buffers up to 16MB in length, as opposed to 1MB with non-32-bit versions of color QuickDraw. This additional frame buffer address space is becoming increasingly important as the use of 24-bit color becomes more prevalent.

For a user to benefit from this 32-bit addressing mode they must install a video card capable of taking advantage of it. In turn, a video card possessing these capabilities must test the system to determine if 32-bit QuickDraw is present or not. If it is present then 32-bit QuickDraw capabilities of the card will be enabled, which means, among other things, the card will expect to be accessed in a 32-bit addressing mode. If 32-bit QD is not present most cards will default to the 24-bit addressing mode. In this way, a new card possesses the flexibility to adjust to whichever QuickDraw environment it finds itself in.

In a system where 32-bit QuickDraw is present and there is a 32-bit QuickDraw capable card installed, there is the potential for incompatibilities with certain applications that directly address, (i.e. bypassing QuickDraw) the video frame buffer. A number of paint applications fall into this category. Previously, these applications could directly access all frame buffers in 24-bit addressing mode and know that they would work. However if an application is running on a system with 32-bit QD installed and a 32-bit QuickDraw capable video card is also installed and the application attempts to directly address the frame buffer a problem occurs. The application is attempting to access a 24-bit address in 32-bit addressing environment. In this case, the address request will be redirected to the 24-bit alias of the 32-bit buffer and you end up with garbled screen data or a system that hangs.

Keep in mind this situation can occur on any machine with 32-bit Quickdraw and a 32-bit QuickDraw capable card installed. The difference is that on a machine with 32-bit QuickDraw as an INIT in RAM, the INIT can be deactivated and the system will revert to 24-bit addressing for the frame buffer (although it will lose new features). Because on a Macintosh IIci, 32-Bit QuickDraw is in ROM, it cannot be defeated, so these applications will not work correctly, and require revision. Once again, this problem occurs only with new video cards that expect 32-bit QuickDraw.

IMPORTANT NOTE: The revision to HyperCard from 1.2.2 to 1.2.5 was required to address this issue.

#### 4) Built-in video

One of the features of the Macintosh IIci's built-in video design is the fact that it is self configuring, which means that all the user has to do is plug the monitor into the video port and the system automatically recognizes what monitor is attached and configures itself accordingly. Offering this feature required that there be some type of monitor identification scheme included in the design. The scheme used in the Macintosh IIci is to designate three of the 15 pins within the video connector for monitor identification. This gives the system a 3 bit value (3 pins pulled high or low, where high = 1 and low = 0) for identifying up to 8 different conditions, (7 different monitors + 1 no-monitor condition).

It is significant to note that this scheme originated with the introduction of the revised 4•8 bit video card introduced in the spring of 1989. It is also important to note that it is utilized on both the 8•24 and 8•24GC cards, and in the future it will be utilized in all future systems which incorporate built-in video and in all future video card designs from Apple.

Article Last Updated:

TOPIC -----

This is part four of a four part article detailing the changes which caused the compatibility problems the Macintosh IIci faced. A significant number of Macintosh IIci compatibility problems were related to the improvements outlined below. Keep in mind that the majority of applications were not affected by these changes and that most of those that were have been updated.

DISCUSSION -----

Leading Causes for Macintosh IIci Incompatibilities (Con't)

### 5) ADB manager

In an effort to reinforce the ADB standard, protocols surrounding the polling of ADB devices were more explicitly defined. Clarifying the rules surrounding the polling process revealed the fact that certain developers had made false assumptions. This especially affected developers using an ADB hardware lock for copy protection. As it turns out there was really only one third-party vendor affected by this change. However the impact was magnified because this one developer sold their lock to a number of third-party software developers who include the ADB lock as a standard part of their application. Once the problem was diagnosed, Apple worked with the developer of the ADB lock on a solution.

### 6) 25Mhz Clock Speed - "Too fast"

Certain applications were designed around the assumption that a call to a particular chip or location in memory would be returned within a given interval of time. Those developers who made this assumption ensured that

their product would break when Apple introduced a higher clock speed system. The Macintosh IIci turned out to be that higher speed system. This change affected only a small number of developers who had instituted timing-dependent copy protection schemes and developers who designed timing-dependent games.

#### 7) Gamma correction

Since its introduction, all Macintosh II systems perform color correction, commonly called "gamma correction", on video displays to compensate for non-linearity in the monitor's phosphor response. The effect of a proper gamma table is to make a monitor appear brighter and colors more vivid. Theoretically each brand of monitor has its own unique phosphor composition and therefore each monitor should have its own "device specific" gamma table.

The fact is that most third-party vendors do not provide a gamma correction table data with their monitor, so machines released prior to the Macintosh IIci set all displays to the gamma correction designed for the Macintosh Hi-Res RGB Display. While this was not really correct, it nonetheless ensured that all displays had at least some form of gamma correction.

In order to encourage third parties to offer their own gamma correction information, the new video card architecture (incorporated into the Macintosh IIci ROM) supports improved methods of carrying this device-specific data with each card. As a result of this change the Macintosh IIci scans for gamma table data in each video card and sets each card with its own customized gamma tables. In many cases, third-party cards do not properly initialize their own hardware, expecting to be set with the Hi-Res RGB gamma table. As a result, displays connected to these cards are left uncorrected, which means that they tend to look significantly darker when connected to the Macintosh IIci.

As an aid to improving the appearance of old cards on the Macintosh IIci, Developer Technical Support made available source code to an INIT that allowed developers to load the appropriate gamma table information.

#### 8) Problems related to bugs in the Macintosh IIci ROM

In addition to those problems that we were aware of, there were a number of unanticipated problems that were discovered in the Macintosh IIci ROM. These changes have been corrected through bug fixes incorporated into the 6.0.5 release of system software.

##### - Palette Manager

There was a patch file for the Palette Manager which failed to be included in the final Macintosh IIci ROM. This patch file helps to correct a minor problem in the 32-bit color QuickDraw code built into the Macintosh IIci ROM, which determines the color palette for an application when it is opened. By not including this patch, certain paint and image processing applications ended up displaying colors incorrectly.

- Zero-width Characters

This is a bug which was inadvertently introduced in the Macintosh IIci ROM. It causes zero-width characters to not be drawn. Zero-width characters include characters used for musical notation, foreign languages (i.e. Kanji and Arabic) and mathematical notation. This caused particular problems for developers doing musical typesetting and some mathematics programs.

- Serial Driver

Due to an anomaly in the serial driver code, when a Macintosh IIci is being used with a modem and a break character is returned during a communications session, the system will crash or hang. This does not occur frequently, but does occasionally occur when a user is engaged in a session with one of the remote information services.

- TextEdit

There were a handful of bugs in TextEdit which were incorporated in the Macintosh IIci ROM. The majority of these problems are cosmetic and do not cause the system to fail. TextEdit is used by a number of applications including AppleLink and HyperCard. In addition, TextEdit is used in all dialog boxes that appear on your screen.

## Apple IIGS: Use DuoDisk on Interface Card, NOT on SmartPort

Revised: 6/29/90  
Security: Everyone

Apple IIGS: Use DuoDisk on Interface Card, NOT on SmartPort

=====

This article last reviewed: 2 April 1990

TOPIC -----

I have a "Blockbuster" Apple IIGS with Rev. 3.0 ROM, a DuoDisk, and Profile in slot 7.

I plugged the DuoDisk into the disk port on the Apple IIGS main logic board, installed the ProFile in slot 7, and set the Control Panel to "your card." Leave both DuoDisk drives empty and power on the system. Then I set startup to "Scan."

The DuoDisk LED for drive #1 should turn on, but the system will not start. Why did the Apple IIGS skip the ProFile in slot 7? Then, when I power down the Apple IIGS and put a non-write-protected disk in the DuoDisk drive, it still doesn't start.

If I power down the Apple IIGS and place a write-protected disk in the drive, then power on the system. The system starts up as expected, following the "Control Panel".

If the system appears to be "hung" following any of the above steps, momentarily triggering the write-protect switch by inserting anything into the drive allows the system to start up.

There appears to be compatibility problems with the new Apple IIGS main logic board and the DuoDisk. Performing the "DuoDisk/Apple IIGS fix" that is posted on AppleLink has no effect since the problem appears to be hardware (firmware) based.

What can I do?

DISCUSSION -----

There IS a compatibility problem with the DuoDisk and the Rev 3 Apple IIGS main

logic board. Do not use the DuoDisk on the SmartPort: there is some code in the ROM that does not handle the interface to a DuoDisk properly.

As of April, 1990, the only workaround is to use the DuoDisk on an interface card.

## InitCdev and Virus Detectors May Conflict

Revised: 6/29/90  
Security: Everyone

InitCdev and Virus Detectors May Conflict

=====

This article last reviewed: 2 April 1990

TOPIC -----

I've been using InitCdev 2.0, a freeware INIT management utility. With the AppleComm Toolbox on my system, when I invoke InitCdev, it crashes with ID=17 (package 0 not present--list manager).

Can you explain?

DISCUSSION -----

Try moving a couple of virus detectors around, so that SAM Intercept loads before the InitCdev, and Vaccine loads after InitCdev, then the Apple Communication Toolbox should work fine.

## AppleShare File Server and Viruses, Continued

Revised: 6/29/90  
Security: Everyone

AppleShare File Server and Viruses, Continued

=====

This article last reviewed: 2 April 1990

TOPIC -----

Since an AppleShare file server can be infected with WDEF, can the existence of WDEF on the server affect its performance? Also, since the server uses a different format of the Desktop file, which file gets infected?

DISCUSSION -----

The WDEF virus causes a significant performance lag on the file server during the time the Desktop file on the server is being written to. After the initial infection, there won't be a performance problem.

The file called "Desktop" is the file that is infected. Remember, this is the file at the root level of the volume. The "Desktop DF" and "Desktop DB" files created by the Desktop Manager INIT are in the Server Folder, and are not bothered by the WDEF virus for two reasons:

- 1) The Server Folder is not accessible by any program on a workstation.
- 2) WDEF looks for a file called "Desktop" to infect, not "Desktop DF" or "Desktop DB".

## Ethernet Backbone and Seed Routers

Revised: 6/29/90  
Security: Everyone

Ethernet Backbone and Seed Routers

=====

This article last reviewed: 2 April 1990

Information -----

Here are some questions and answers about supporting AppleTalk on a corporate Ethernet backbone -- specifically, a group-managed, Macintosh-based Internet router which would be the sole seed router for the Ethernet.

- Q) Can all third-party routers that support the AppleTalk Phase 2 protocol accept seeding from the AppleTalk Internet Router?
- A) All third-party routers that Apple Tech Comm is aware of can receive their network information from the AppleTalk Internet Router. It is best to confirm this information with the manufacturer of the routers that your account plans to use. Remember, there must be a seed router on every physical cable.
- Q) What is the effect on the network if the seed router goes down for 24 hours or more?
- A) Nothing, other than losing the ability to route packets to the networks on the other side of the seed router. If a router that depends on the seed router goes down, when it attempts to come back up it will not get a network number for the physical cable common to both routers and will not route.
- Q) What is the effect if a user brings up a non-seed router with different network numbers and zone names?
- A) All the routers of which Apple Tech Comm is aware will report that there is a network number and/or zone name conflict and will not come up. If a router did allow you to enter with an incorrect zone or network number information, many problems would occur. Network devices may not appear, or they may appear in different zones. Packets will be lost and many network

errors will be generated.

Q) If I need to expand the seed routers network range and zone list, must I bring the other routers down for the update?

A) Yes, the seed router will attempt to run and notice that the network number range and/or zone name is different and report an error regarding the conflict. This necessitates bringing down the other routers on the same physical cable that get their network information from the seed router. As usual, the seed router must be up and running before the other routers are brought up.

## HyperCard and Microsoft Mail Conflict and Fix

Revised: 6/29/90  
Security: Everyone

HyperCard and Microsoft Mail Conflict and Fix

=====

This article last reviewed: 2 April 1990

TOPIC -----

I am experiencing problems using System Software 6.0.4, Microsoft Mail 2.0, and HyperCard 1.2.5.

While using HyperCard, I receive a Microsoft Mail message. At that point, my machine produces a high-pitch tone. (This tone cannot be stopped unless I quit HyperCard or initiate a beep tone from my Macintosh within HyperCard.

What's going on here? Is there a fix?

DISCUSSION -----

HyperCard also has a similar conflict with some versions of InBox.

As of April, 1990, the only workaround is to turn off the notifying chime until the problem is resolved.

## Making a Hard Drive Read-Only

Revised: 6/29/90  
Security: Everyone

Making a Hard Drive Read-Only

=====

This article last reviewed: 2 April 1990

TOPIC -----

I want my internal disk drives to have a jumper that allows me to set the drive for read-only access. Can I do this? If so, which one and how do you set it?

DISCUSSION -----

There is no jumper or switch on Apple hard drives that make them read-only. However, there are ways to do this via software.

The first method requires that the hard drive be formatted by Apple HD SC Setup 2.0:

- 1) Start up from a floppy disk and run HD SC Setup 2.0 from that disk.
- 2) Select the hard disk that you want to make read only.
- 3) Click the "Partition" button.
- 4) A new dialog appears; click the "Custom" button.
- 5) Click on the Macintosh partition (the hard disk name appears in the partition).
- 6) A new dialog appears; click the "Lock" button.
- 7) Click the "Done" button.
- 8) Quit HD SC Setup.

The Macintosh partition of the selected hard disk is now write protected.

You can also use a disk editor, such as FEdit (this method works with hard

disks formatted by earlier versions of HD SC Setup):

- 1) Open the hex representation of the volume that you want to lock.
- 2) Go to sector number 2. (This should be the third sector on the disk, with each sector having a length of 512 bytes.)
- 3) The sector should look something like this:

```
          ****
4244 9FAE F13C 9FAF 228B 0000 0010 0003
0000 063A 0000 0200 0000 0800 0004 0000
0020 0488 0855 6E74 6974 6C65 6400 0000
..... and so on,
```

where the 4244 begins at the zero byte of the sector.

- 4) The key location is where you see the word with the "\*\*\*\*\*" over it. It should be located at the tenth byte and be \$0000.
- 5) If the 8000 is at the tenth byte, change it to \$8000 and write the sector to disk.
- 6) Restart the system to have the change take effect. (This information is usually stored in memory and won't be updated until you restart.)

Running software from a locked disk is not advised unless the locked device is NOT the startup disk. Many applications create scratch files in the System Folder of the startup disk. If it's locked, the software probably won't run. Some software even expects its home disk to be unlocked. If the locked device is not the startup disk, and the user is only going to read from it, then everything should be okay.

## AppleShare File Server and Virus Protection

Revised: 6/29/90  
Security: Everyone

AppleShare File Server and Virus Protection

=====

This article last reviewed: 2 April 1990

TOPIC -----

What are your recommendations on virus protection for file servers?

Also, can a server be infected with the WDEF virus? If so, since WDEF is spread by a machine coming in contact with an infected disk's Desktop file, how is it spread? Does a server access a workstation's Desktop file?

DISCUSSION -----

Apple Tech Comm does not recommend using INITs that offer virus protection on file servers. A server will freeze if a dialog appears alerting the nonexistent user about an infection attempt. We suggest that instead you use a program that scans the AppleShare File Server for viruses on a regular basis.

The AppleShare Server Folder itself is quite secure when the server is running. Is it not accessible by any system call, whether high-level or low-level. A virus can attack only folders and files for which the user of the infected program has write access privileges. It is not necessary or recommended to install Vaccine in the Server Folder on the AppleShare File Server. If the server is running at the Finder level, it is just as susceptible to viruses as any system.

An AppleShare file CAN become infected with the WDEF virus. When any new volume is mounted, the WDEF virus looks for a file called "Desktop" at the root level and copies itself into it. Once the file server is infected with the WDEF virus, the virus is dormant because the Desktop file is not accessed by workstations and is not used by the file server.

## EtherTalk 2.0: Needs AppleTalk Driver v53

Revised: 6/29/90  
Security: Everyone

EtherTalk 2.0: Needs AppleTalk Driver v53

=====

This article last reviewed: 2 April 1990

INFORMATION -----

You may discover a compatibility problem with some networks (usually demonstration networks where many different types of software have been used).

The problem occurs when a server has first had EtherTalk 2.0, installed, then later has had EtherTalk 1.0 or 1.2 installed. AppleTalk driver version 53 -- which is installed with EtherTalk 2.0 -- does not work with earlier versions of the EtherTalk driver.

When switching from EtherTalk 2.0 to EtherTalk 1.0 or 1.2, AppleTalk driver v53 must be removed from the System Folder and replaced with AppleTalk driver version 52, which works with EtherTalk 1.0 and 1.2.

The removal must be done manually, by dragging the AppleTalk driver icon from the folder. Installing the new version can be done either with a Finder copy, or through the EtherTalk 1.0 Installer.

## AppleShare PC: Printing to ImageWriters

Revised: 6/29/90  
Security: Everyone

AppleShare PC: Printing to ImageWriters

=====

This article last reviewed: 12 April 1990

TOPIC -----

Can you print to an AppleTalk ImageWriter from a PC using a LocalTalk PC Card and AppleShare PC 2.0? Also, does the current version of AppleShare PC include the drivers that allow printing to this device?

I have heard that AppleShare PC prints to both the ImageWriter II and the ImageWriter LQ printers.

DISCUSSION -----

The AppleShare PC Desk Accessory does provide a network choice for the ImageWriter II and ImageWriter LQ printers.

AppleShare PC has included AppleTalk Printer Drivers for the ImageWriter II and ImageWriter LQ since version 1.1. This was not available in AppleShare PC 1.0. Anyone using a version of AppleShare PC that does not have the ImageWriter drivers as a desk accessory option should upgrade to the latest version of AppleShare PC version 2.01.

About ImageWriter printing:

AppleShare PC first requires the PC application to choose its own Epson driver or ImageWriter driver. If the application has an ImageWriter driver, AppleShare PC will manage only the AppleTalk connection. If the application supports only Epson printing, AppleShare PC will handle the AppleTalk connection to the ImageWriter and convert the application's Epson commands to ImageWriter commands. This requires the user to configure the AppleShare PC connection to the ImageWriter with the Epson print option.

## LaserWriter as a Serial Printer

Revised: 6/29/90  
Security: Everyone

LaserWriter as a Serial Printer

=====

This article last reviewed: 12 April 1990

TOPIC -----

I've been doing some work with the Asynch LaserWriter drivers, testing a mixed DOS/Macintosh environment.

- 1) When the LaserWriter is used as a serial printer, does it respond to ASCII codes with the 8th bit set the same as codes with the 8th bit not set? For example: Is 83h = 03h, 84h = 04h, 93h = 13h, 91h = 11h?
- 2) Does the LaserWriter respond to the above control codes when in AppleTalk mode as well as when in serial mode?

DISCUSSION -----

These questions are interrelated, and the answers may be easier to follow if we answer #2 first.

- 2) A control code is used by a printer for a specific printer function. When the printer is in AppleTalk mode, the PostScript program language is used, and uses words to activate or invoke printer functions, not control codes. However, the printer uses control codes if it is in Diablo or LaserJet (if available) emulation mode.
- 1) If the printer is in Diablo or LaserJet mode, the above is correct if it is set for 7-bit data with no parity check, as the 8th bit is dropped -- but if the printer is in 8-bit mode, the mapping is not equivalent.

(NOTE: Part of the printer configuration requires you to select whether 7- or 8-bit communication and parity is used, so question 1 may be moot.)

## EPROM Burners for Macintosh

Revised: 6/29/90  
Security: Everyone

EPROM Burners for Macintosh

=====

This article last reviewed: 12 April 1990

TOPIC -----

Is there an EPROM programmer device or software that can be connected to the Macintosh ?

DISCUSSION -----

You have quite a few options. If you search the Redgate Buyer's Guide or MENU/Software Library on the keywords EPROM and Macintosh, you'll get a list of many software applications. Many of these programs generate object files in Motorola S, Intel Hex, and TEK-Hex (Tektronics format) record formats, used by a majority of PROM burners. Some programs have their own built-in communication emulation package, while others require you to use a terminal emulation program, such as MicroPhone or MacTerminal, to download to an emulator or EPROM programmer connected to the Macintosh modem or printer port.

We have also seen various PROM burners advertised in the Macintosh magazines. A check of back issues should help you develop a list of names.

## LaserWriter IINTX-J Printing Problems

Revised: 9/29/92  
Security: Everyone

LaserWriter IINTX-J Printing Problems

Article Created: 12 April 1990

Article Change History:

-----  
09/29/92 - REVIEWED  
• For technical accuracy.

TOPIC -----

I'm having printing problems with a Kanji LaserWriter. I need to print both Japanese and English documents on the same LaserWriter IINTX-J. Can you answer these questions?

- 1) LaserWriter 5.2 works, but very slowly. In fact, a page in Osaka prints faster on a LaserWriter IINTX (bitmapped output) than on a LaserWriter IINTX-J.
- 2) LaserWriter 5.3 works OK in Kanji on the LaserWriter IINTX-J but does not support printing in Roman characters. We cannot print a page of plain text in Times or Helvetica. Can you explain?
- 3) Does Apple have a Kanji PrintMonitor/Laser Prep/LaserWriter 6.0 Driver?

DISCUSSION -----

- 1) This is an interesting problem and will be obvious once explained. There are variables that need confirmation and reconciliation, however.

Osaka is a bitmapped font and has no PostScript equivalent; therefore, the optimal print times will be the same if everything is equal (actually, a bitmap print job is a little faster on a LaserWriter IINTX-J because the printer ROM version is newer, and the LaserWriter IINTX-J is usually configured with more RAM than a stock LaserWriter IINTX).

In your case, print jobs are probably slower on the LaserWriter IINTX-J because Font Substitution is most likely selected, causing the driver to perform additional searching (it attempts to locate and use a "double-wide" Kanji font on the printer) prior to printing. (The question to ask that will help verify the problem is whether both outputs are bitmapped, or if the LaserWriter IINTX-J substitutes a built-in PostScript font.) If it is printing a bitmapped font, even though Font Substitution is selected, the wrong version of "Kanji" fonts are being used or the font is damaged. We recommend that you always install the version of "Kanji" fonts that comes with the drivers and OS, and don't mix and match older fonts with newer drivers, for instance.

(NOTE: The above suggested workarounds are, of course, negated if you are using a program like MacPaint, which outputs a bitmap. This answer assumes that you are using a word processing or other type of application.)

- 2) This is very peculiar, and should work! We suspect the wrong versions of fonts are being used with the wrong version of driver. Less likely is that the application, drivers, or OS is damaged. Again, it is best to replace old Kanji fonts with the new ones that accompany the drivers and OS when updating the drivers. To investigate this further, we would need more details. Eventually, you may want to upgrade the account to the latest version of the driver, when you obtain it.
- 3) You can obtain the J1-5.3 driver from the Technical Support Information Source CD on the Utilities 2 disk.

#### Performance Tips

-----

- For optimal appearance of the output and throughput, you might want to use a built-in PostScript Kanji font, Gothic or Saimin, particularly if you are doing any scaling.
- If you are using both Kanji and Roman fonts in your document, for optimal printing speed, don't use a font menu to select between the fonts. Instead, use the Roman fonts built in to the Kanji font. You can change back and forth between the Kanji characters and Roman characters, say in Kyoto, by pressing Command-space. This minimizes the number of font bitmaps the printer must build when printing a job, which can decrease the amount of time required to print.

## System 6.0.4: Problem with Two-Floppy Macintosh SE and AFE

Revised: 8/23/91  
Security: Everyone

System 6.0.4: Problem with Two-Floppy Macintosh SE and AFE

=====

Article Created: 1 May 1990  
Article Last Reviewed: 23 August 1991  
Article Last Updated: 23 August 1991

TOPIC -----

When trying to run Apple File Exchange on a Macintosh SE configured with two Apple SuperDrives (formerly Apple FDHD), running under System v6.0.4, I get an "ID=02" bomb. I also experienced the problem when starting up from the v6.0.3 System Tools disk; however, when I started up with a startup disk created from the System v6.0.3 Installer, I could get AFE to run.

I have tried several combinations of drives. The bomb occurs any time a SuperDrive is plugged into the drive slot marked "Upper" on the main logic board. Apparently the same problem occurs when starting from an external hard disk (until the upper drive is disconnected).

What's going on?

DISCUSSION -----

This is a little-known incompatibility with dual-floppy Macintosh SEs, those having either SuperDrives or 800K drives. As of April, 1990, there is no fix available for system software v6.0.4.

If you need to get the configuration working, however, one of the following workarounds may do the trick:

- Disconnect one of the floppies and connect an internal or external hard disk.
- Configure a disk using earlier versions of AFE (say 1.1.1 with system software 6.0.3) as you described above.

## Multi-User Relational DBMS for Both Macintosh and PC

Revised: 1/18/93  
Security: Everyone

Multi-User Relational DBMS for Both Macintosh and PC

=====

Article Created: 1 May 1990

### Article Change History

-----

1/15/93 - UPDATED  
• Changed vendor name.

### TOPIC -----

I need a set of database programs that run on both the Macintosh and PC and can use a common set of relational database files on a server (multi-user type).

I know that some Macintosh products can read and run dBASE, but do they work on a network?

### DISCUSSION -----

Omnis 5 from Blyth Software and FoxBASE+ (used with FoxBASE+/LAN) from Microsoft both allow data files to be shared in a combined PC and Macintosh network environment.

FoxBASE+ includes tools that allow simple entry/retrieval forms to be drawn, and these tools can generate the code to handle the simple forms. FoxBASE+ also can directly use dBASE code from Borland International's dBASE.

We are not aware of a multi-user relational database that works on both platforms on a network and does not use a programming language.

To locate a vendor's address and phone numbers, use the vendor's name as a search string.

## Apple IIGS: Choosing Networked ImageWriter

Revised: 6/29/90  
Security: Everyone

Apple IIGS: Choosing Networked ImageWriter

=====

This article last reviewed: 12 April 1990

TOPIC -----

I have two networks at two different schools. The first network has approximately 30 Apple IIGS systems, one Macintosh SE (acting as an AppleShare File Server), a Macintosh SE with HD20 SC, and four ImageWriter II printers with LocalTalk Option Cards. The network is connected with PhoneNET cabling and the machines are placed in no particular order around the network.

When the last LocalTalk ImageWriter II is added to end of the network, the LocalTalk ImageWriter II printers drop from the Chooser and become invisible to the Apple IIGS systems. The Macintosh SE can still see and print to the ImageWriters, however. If the LocalTalk ImageWriter II is moved to another location on the network with PhoneNET cable and connector box and another LocalTalk ImageWriter II is put in its place, the same thing happens. If the ImageWriter II is removed from the network, the Apple IIGS systems can see the other printers.

The second network uses a StarController and PhoneNET. One channel of the StarController has a Macintosh SE/30 AppleShare File Server; the second channel has 12 Apple IIGS systems, one Macintosh SE, and one LocalTalk ImageWriter II; the third channel has 15 Macintosh SE systems and three LocalTalk ImageWriter II printers. At some point, when enough machines are added, the same thing as above happens -- that is, the Apple IIGS systems can't see the ImageWriters, but the Macintosh systems can.

I ran Inter-Poll on one of these networks after the failure occurred. All Apple IIGS systems and all ImageWriter II printers were visible.

Note that in both cases the Apple IIGS systems start up from the network. What might cause this? Can you recommend any steps to cure this problem?

DISCUSSION -----

NOTE: We are assuming that when you speak of using the Chooser, you're talking about the network ImageWriter CDEV found in the GS/OS Control Panel.

The GS/OS Control Panel network ImageWriter CDEV cannot handle more than three networked ImageWriters. When the fourth ImageWriter is added to the network, all networked ImageWriters disappear. There is no way to change the CDEV's performance.

When using GS/OS applications, the only workaround is to switch off ImageWriters until only three are active on the network; make the printer selection via the CDEV; then power on the remaining printers. Once the selection process is complete the printing process will work properly. Even though the CDEV cannot locate a printer, the GS/OS Print Manager can.

When using ProDOS 8 applications, using Chooser.II allows all available network ImageWriters to appear. Using Chooser.II does not work with GS/OS applications because Chooser.II stores its choices in the ATINIT file associated with that user. GS/OS applications look to the CDEV choices for printing operations.

In summary:

- For ProDOS applications, use Chooser.II.
- For GS/OS applications, use the Control Panel's network ImageWriter CDEV.

When using GS/OS with more than three ImageWriters on the network, perform printer choices when only three ImageWriters are powered on. Once chosen, all printers can be powered on and used normally.

Other than these workarounds, as of April, 1990, there is no solution to the GS/OS Control Panel CDEV problem.

## HyperCard: Don't Refer to Cards by ID in Non-Static Stacks

Revised: 6/29/90  
Security: Everyone

HyperCard: Don't Refer to Cards by ID in Non-Static Stacks

=====

This article last reviewed: 12 April 1990

TOPIC -----

I'm working on a HyperCard application that makes extensive use of card ID numbers while also doing a lot of copying/cutting and pasting of cards for various reasons. The problem is that ID numbers occasionally change after cards are cut and/or pasted. As a result, functions that rely on the old ID numbers are upset.

Is there a way around this? When are card ID numbers changed; when are they not? Is there a way to force the ID number to remain the same or to change the ID number of an existing card?

My current solution is to check the ID number before and after copying, and if changed, laboriously replace all instances of the old ID number string with the new in all scripts (unsatisfactory, but better than nothing). In particular, I am working with two separate stacks, copying cards from one stack and placing them in another with the hope that the ID number will be the same on the new stack. There doesn't seem to be a pattern to when the ID number changes and when it doesn't.

DISCUSSION -----

Referring to cards by their ID number is a great idea in static stacks. ID numbers are guaranteed to be unique, so the user can be sure no conflicts result. When working in a constantly changing stack, it's best to reference the card by name. When a card is created, we suggest that the user use something like:

set the name of this card to "C" & the ID of this card

to name the card. That way, names are reasonably unique (conflicts will be extremely rare) and cutting and pasting won't change the item referenced. The letter in quotes (in this case "C") can be any character, although it's

safer to use letters. The purpose of the leading letter is to keep HyperCard from referencing card NUMBER "xxx" instead of card NAME "xxx".

## AFE: Problem May Be Faulty Cable or Missing SMB Server

Revised: 6/29/90  
Security: Everyone

AFE: Problem May Be Faulty Cable or Missing SMB Server

=====

This article last reviewed: 12 April 1990

TOPIC -----

I received this message when launching AFE to do SMB file transfer:

"The Token Ring interface driver could not be opened."

The Apple File Exchange then launches without file transfer capability.

I'm running a Macintosh IICx with System 6.0.4, EtherTalk NB Card, video card, and TokenTalk NB Card.

Can you explain?

DISCUSSION -----

This error message appears when there are problems with cable connections or when the SMB File Transfer Utility cannot find an SMB server on the ring.

Make sure that the cable is fully connected to the TokenTalk NB Card and the MAU, and ensure that the SMB file server is still running on that ring.

If that does not correct the problem, you might try a different TokenTalk NB Card, or try a different cable and connect it to a different port on the MAU.

## LaserWriter: Problem Printing Multiple Copies

Revised: 6/29/90  
Security: Everyone

LaserWriter: Problem Printing Multiple Copies

=====

This article last reviewed: 12 April 1990

TOPIC -----

I'm having a problem printing multiple copies of a document with a LaserWriter IINT through the AppleShare Printer Server. If the number of copies to print is greater than 6, the LaserWriter IINT doesn't stop when it reaches that number.

I increased the timeout delay on the printer (using SENDPS application) to send PostScript code to the printer, and installed LaserWriter Driver 6.0.1 and Laser Prep. Neither of these measures corrected the problem.

Can you help?

DISCUSSION -----

This is a known problem with the LaserWriter family of printers that is particularly noticeable when printing to a LaserWriter via a LaserShare or an AppleShare Print Server. Macintosh Technical Note #123 describes the problem.

If a user prints more than 15 copies of a document, a timeout condition may occur, causing the print job to abort. With LaserShare or AppleShare Print Server, this problem can happen with as few as nine copies. This problem is a result of the LaserWriter not sending packets at the proper times to maintain the connection to the device sending the print job. Because of this, the connection times out after about 2 minutes. The AppleShare Print Server then sends the job to the LaserWriter again causing a duplicate set of printouts. This happens only when the LaserWriter is extremely busy.

The LaserWriter IINTX seems least affected by this problem.

As of April, 1990, we know of no solution.

## AppleShare Print Server: Problems Using with Macintosh IIfx

Revised: 6/29/90  
Security: Everyone

AppleShare Print Server: Problems Using with Macintosh IIfx

=====

This article last reviewed: 10 May 1989

There are some bugs in the AppleShare Print Server that only show up when the print server is run on a Macintosh IIfx machine. The bugs will be fixed in the AppleShare Print Server software in a future release that will ship subsequently to the release of the Macintosh IIfx machine.

NOTE: These bugs only occur under heavy load, for example when the server has captured 3-4 printers and all those printers are in use.

The bugs and the recovery mechanisms are described below:

Bug: While the spooler is running under heavy load, sometimes it puts up a dialog box with an error message saying something like "A fatal error happened so the print server attempted to clean up before releasing the printer. Error code -1104" or -91". When you click OK, the spooler closes the connection with the affected printer (stops spooling for that printer). Spooling on other captured printers goes on as usual.

Recovery: Re-capture the printer you just lost. Things should return to normal at that point.

Bug: While the spooler is running under heavy load, if you try to capture and release printers several times, sometimes the spooler crashes (with bus error) while trying to release a printer.

Recovery: Reboot the machine and restart the spooler.

## ImageWriter LQ: Temperature Sensor Prevents Overheating

Revised: 6/29/90  
Security: Everyone

ImageWriter LQ: Temperature Sensor Prevents Overheating

=====

This article last reviewed: 1 May 1990

TOPIC -----

I have a problem with my ImageWriter LQ. Every month I do a payroll run, printing continuously for 2 to 3 hours. Often, at some stage, the printer just stops.

Is it overheating? If so, how long can an ImageWriter LQ print before it overheats?

DISCUSSION -----

Yes, it is very likely that the ImageWriter LQ is overheating. There is a temperature sensor in the printhead that causes the printer to stop printing when the printhead temperature reaches approximately 190 degrees Fahrenheit. The ImageWriter LQ printhead reaches this temperature after printing pure black for about 1 hour. Depending on the text being printed, the printhead may overheat after approximately 2 to 6 hours of continuous printing.

## Macintosh Family: Serial Port Cable Length Specifications

Revised: 11/19/92  
Security: Everyone

Macintosh Family: Serial Port Cable Length Specifications

Article Created: 1 May 1990  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

TOPIC -----

The Macintosh Portable serial ports don't seem to have the same capacity as other Macintosh systems.

My Macintosh Portable won't establish an asynchronous session to a mainframe using VT240 emulation from White Pine, version 3.0.1, through the serial ports. I've tried three different Macintosh Portables with no luck. When using the same line with a Macintosh SE, all is well; sessions run without any problem. The cable, connected to Ethernet and to the VAX, is approximately 20 meters long.

White Pine Tech Support told me that version 3.01 works okay on the Macintosh Portable; they are running that configuration, but they use a "limited distance" modem with serial port.

DISCUSSION -----

The first and most obvious problem is the cable length. Twenty meters is nearly 60 feet (over 31 percent) longer than the EIA RS-232-C specification of 50 feet. This could cause the communications difficulties. The Macintosh Portable is designed to the RS-422 specification with the ability to meet the RS-423 specification.

This means it can be used to communicate with most RS-232-C devices over distances up to approximately 50 feet. Shortening the cable to within specification or adding the "limited distance" modem (known as a "short-haul modem" in the U.S.) should resolve the connection problem.

Occasionally, computers can go beyond the RS-232 specification; however, if a machine works at lengths greater than 50 feet, it is considered the

exception.

The output power of all Macintosh models, including the Macintosh Portable, is completely within the EIA RS-423 specification. The RS-423 specification is designed to accommodate RS-232-C devices in a RS-422 environment. The RS-422 design is the Macintosh standard for serial ports and was chosen for its ability to carry serial signals over greater distances than the RS-232-C design. The RS-423 specification also encompasses the RS-232-C specification. This means that a device that conforms to RS-423 also conforms to RS-232-C.

The output power of most serial devices is determined by the line driver integrated circuits. The Macintosh systems in question all use the 23LS30 line driver IC, which is designed to meet the RS-422, RS-423, and RS-232-C specifications.

The RS-232-C specification states that a line driver output value more positive than +3 volts is considered ON (or SPACE or 0). The Macintosh serial ports provide a positive voltage level of +3.6 volts. The specification states that a line driver output level value more negative than -3 volts is considered OFF (or MARK or 1). The Macintosh serial ports provide a negative voltage of -3.6 volts. The output impedance specification is stated as greater than 300 ohms; the Macintosh serial ports provide 450 ohms.

Why does a Macintosh SE work when the Macintosh Portable doesn't? Because 65.62 feet (20 meters) falls outside the maximum distance stated in the RS-232-C specification of 50 feet (15.14 meters), performance will be erratic and unpredictable. Because of slight design differences, part variances, and environmental changes, one model of Macintosh (or even different units of the same model, or even the same unit at different times) may work at distances greater than 50 feet, while another may not. Once the specification has been exceeded, these results most likely will be inconsistent.

## GOSIP (Government OSI Profile) Information

Revised: 6/29/90  
Security: Everyone

GOSIP (Government OSI Profile) Information

=====

This article last reviewed: 1 May 1990

TOPIC -----

What is GOSIP? How close is it to being a standard?

DISCUSSION -----

The Federal Information Processing Standard has already adopted the Government Open Systems Interconnection Profile (GOSIP).

GOSIP defines a common set of data communication protocols that let systems developed by different vendors interoperate and lets the users of different applications on these systems exchange information. These Open Systems Interconnection (OSI) protocols were developed by international standards organizations, primarily the International Organization for Standardization (ISO) and the Consultative Committee on International Telephone and Telegraph (CCITT). GOSIP is based on agreements reached by vendors and users of computer networks participating in the National Bureau of Standards (NBS) Workshop for Implementors of Open Systems Interconnection.

GOSIP shall be used by Federal Government agencies when acquiring computer network products and services and communications systems or services that provide equivalent functionality to the protocols defined in the GOSIP documents. Currently, GOSIP supports the Message Handling Systems and File Transfer, Access, and Management applications. GOSIP also supports interconnection of these network technologies: CCITT Recommendation X.25, Carrier Sense Multiple Access with Collision Detection (IEEE 802.3), Token Bus (IEEE 802.4), and Token Ring (IEEE 802.5). Additional applications and network technologies will be added to later versions of the GOSIP document.

This standard became effective February 15, 1989. For a period of 18 months after the effective date, agencies are permitted to acquire alternative protocols that provide equivalent functionality of the GOSIP protocols.

## LaserWriter Family: How To Print Test Page w/o Resetting Printer

Revised: 10/15/91  
Security: Everyone

LaserWriter Family: How To Print Test Page w/o Resetting Printer

=====

Article Created: 1 May 1990  
Article Last Reviewed: 15 October 1991  
Article Last Updated: 15 October 1991

TOPIC -----

What is the PostScript code for resetting the LaserWriter test page?

The code below does perform a reset on all PostScript LaserWriter models produced as of this writing. This includes the LaserWriter, LaserWriter Plus, LaserWriter IINT, IINTX (both ROM versions), IIif, IIg, and Personal LaserWriter NT.

DISCUSSION -----

The following code completely resets the LaserWriter to power-on condition, which is the same as turning the power off and on. This is the only way to get a startup page without turning the printer off and on.

```
serverdict begin 0 exitserver
systemdict begin quit end
```

Note that this behavior of the quit operator outside of the server loop isn't specifically defined by Adobe. It may change in later revisions of PostScript, so it shouldn't be relied on to restart future LaserWriter models.

The following PostScript program prints a page that gives you the current page count (including the page itself) without resetting the LaserWriter (the comments aren't necessary):

```
/Times-Roman findfont %Lookup font in fontdict and push it on stack
15 scalefont setfont %Push size, scale it, and make it the current font.
72 700 moveto %One inch over, and 700 72nds up.
statusdict begin %We'll be using two operators from statusdict.
32 string %Push an empty string of 32 length on stack.
```

## Apple II-to-IBM Host File Transfer

Revised: 6/29/90  
Security: Everyone

Apple II-to-IBM Host File Transfer

=====

This article last reviewed: 1 May 1990

TOPIC -----

How can I transfer an ASCII file from an Apple IIe to an IBM mainframe?

I haven't been able to find any 3270 Apple II solutions. Assuming there isn't a Macintosh available, we could send the ASCII file from the Apple IIe over CompuServe or some other network to a Macintosh (or even an MS-DOS PC) connected to a mainframe. Then, we could make the ASCII-to-EBCDIC conversion and store it on the mainframe.

Are there any other solutions?

DISCUSSION -----

There are two other options. All options, including the one you mentioned, are based on file transfer from the ASCII environment to the EBCDIC environment (microcomputer to mainframe host). This file transfer is where the conversion will take place.

The first option depends on the services available from the mainframe. This method requires a mainframe-attached protocol converter that uses the XModem protocol, plus a communications package on the Apple IIe that also supports XModem. This setup should allow the Apple IIe to dial directly into the protocol converter and upload the file to the mainframe.

The second option is to dial the Macintosh or MS-DOS PC directly instead of paying for a commercial communications service. Since both computers require modems to access the commercial service, and most likely use XModem for the transfer, there should be no difficulties connecting directly to one another with their communications software and using XModem for the transfer. Once transferred from the Apple IIe to the Macintosh or PC attached to the mainframe, the file can be uploaded from the Macintosh or PC using the host's file transfer method.

## Hard Drive SCSI Termination Power

Revised: 6/29/90  
Security: Everyone

Hard Drive SCSI Termination Power

=====

This article last reviewed: 1 May 1990

TOPIC -----

I'm experiencing a startup problem with Mass Microsystem's DataPak attached to my Macintosh. Sometimes I could start up fine with or without the DataPak turned on. Other times, the system hung until the DataPak was turned on.

What's going on?

DISCUSSION -----

The SCSI bus requires termination power on the bus to provide clean, quality SCSI signals. Mass Microsystems' DataPak supplies its own termination power to the SCSI bus. (This characteristic is also common to early SuperMac DataFrames.) Other SCSI devices that we checked use the termination power provided by the Macintosh.

When a SCSI device provides its own termination power, the SCSI bus signals may be corrupted when that device is powered down because it leaves the SCSI bus unterminated. An unterminated SCSI bus can cause startup problems because of noise on the bus.

Sometimes when a SCSI device that supplies its own termination power is powered down, the Macintosh will still start up because the SCSI bus signal is clean enough for the startup process to take place. However, there is no assurance that the bus signals will stay clean and uncorrupted since the SCSI bus is not properly terminated in this situation.

SCSI devices that use the termination power provided by the Macintosh do not have to be powered on for the SCSI bus to be properly terminated. The termination power from the Macintosh provides the correct termination to the SCSI bus.

## HyperCard 1.2.2: Can't Print More Than 127 Pages

Revised: 6/29/90  
Security: Everyone

HyperCard 1.2.2: Can't Print More Than 127 Pages

=====

This article last reviewed: 1 May 1990

TOPIC -----

I am having a problem printing from HyperCard v1.2.2. Specifically, it seems to be the "printing more than 127 pages" problem that others have noticed in earlier versions of HyperCard.

The "Now preparing page x..." counts up to 167 and down, printing pages 167 through 39, and then it terminates as if completed ( $167 - 39 = 128$ ). I compacted the stack before printing, and I tried MultiFinder as well as Finder.

DISCUSSION -----

This is caused by a problem in HyperCard 1.2.2. As of May, 1990, there is no solution to this problem.

## SCSI: Cable Specifications

Revised: 2/10/93  
Security: Everyone

SCSI: Cable Specifications

=====

Article Created: 1 May 1990

2/10/93 - REVISED

- To include complete cable specifications

TOPIC -----

I need SCSI cable specifications, including the wire type, gauge, and required shielding.

DISCUSSION -----

Here they are:

SCSI Cable  
-----

Cable Construction  
-----

38 conductors (19 twisted pairs) cable together. Each Pair shall consist of 2 single - 26 AWG insulated conductors twisted together with 4-8 twists/foot.

DC Resistance  
-----

29 ohms per 1000ft. @ 20 degrees C (each conductor).

Voltage Rating  
-----

30 VRMS

Dielectric Withstanding Voltage Between Shields  
-----

500 Volts DC for 3 seconds

Capacitance (@ 1 KHz)

# ..TIL05475-SCSI-Cable\_Specifications.pdf

-----

- Between conductors of the same pair - 16 pf/ft Max.
- Between 1 conductor and all others tied to shield - 60 pf/ft

## Attenuation

-----

6 db per 1000 ft Max @ 1.5 MHz

## Characteristic Impedance

-----

105 ohms at 1.5 MHz

## Shielding

-----

Braid - 36 AWG copper with 90% min. coverage with 40-degree braid angle

Foil - Aluminum/Mylar 0.0254/0.00889mm, spirally wrapped with

25% overlap

## SCSI Terminator

-----

The following information describes the connections inside the SCSI terminator, Apple part number 590-0348.

Each of the pins listed is connected straight through the connector (for example, 1 to 1, 2 to 2, and so on). In addition, each of the signal pins is connected through a resistor network to terminator power.

### Example:

Pin 26 (DB0) is connected to pin 26. It is also connected to pin 1 (DB0 GND, its corresponding ground) through a 330-ohm resistor and to a common line, which terminates in pin 38 (terminator power), through a 220-ohm resistor. Similar connections occur for each signal pin.

Pin 38 (TERMPWR) is connected to the common line proceeding from the 220-ohm resistors. Pin 11 (DIFFSENS) is connected straight through only.

Here are the connections used in the SCSI terminator:

- Connect the following pins straight through to the same pin at the other end of the connector:

1 through 9, 11, 16, 18 through 34, 38, 41, 43 through 50

- Connect the first pin of each of the following pairs to a 330-ohm resistor, then to the second pin of the pair, then to a 220-ohm resistor, then to the terminator line (TERMPWR) as shown below.

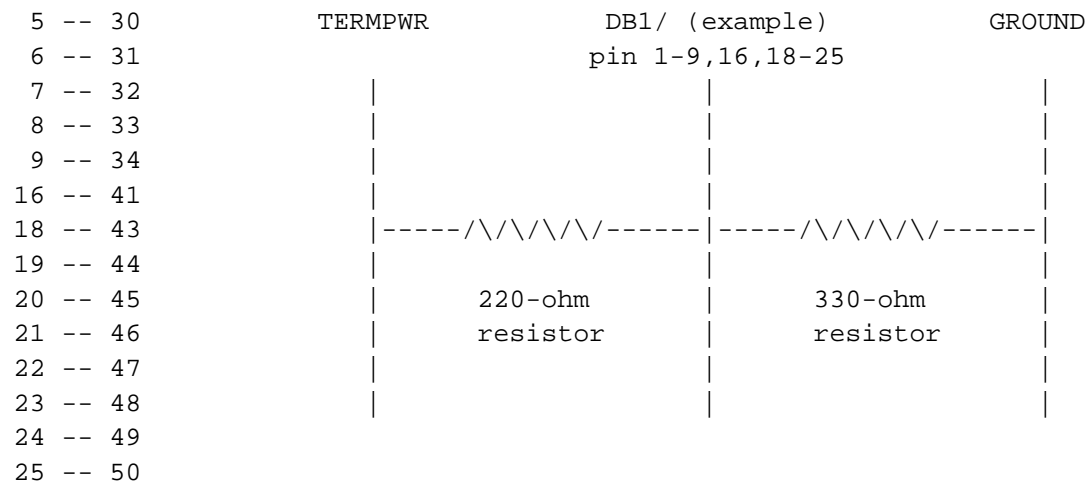

1 -- 26

2 -- 27

3 -- 28

4 -- 29

# ..TIL05475-SCSI-Cable\_Specifications.pdf

- Connect pin 38 to the common terminator line (TERMPWR).

## Macintosh Display Card 8/24GC and Raster Ops Monitors

Revised: 7/16/90  
Security: Everyone

Macintosh Display Card 8/24GC and Raster Ops Monitors

=====  
This article last reviewed: 3 May 1990

TOPIC -----

I have a RasterOps Colorboard 108 plus video card and a RasterOps 19-inch Trinitron monitor. I also have two questions:

- 1) Does the Macintosh Display Card 8/24GC support the RasterOps 19-inch Trinitron monitor?
- 2) If I install the Macintosh Display Card 8/24GC but don't connect a monitor to it, will it accelerate the display on the RasterOps monitor?

DISCUSSION -----

- 1) The Macintosh Display Card 8/24GC supports any display that meets one of the following specifications:

| Sense pins |   |   | Display                              | Hor x Vert<br>Pixels | Dot<br>Clock | Vert<br>Refrsh | Horiz<br>Refrsh |
|------------|---|---|--------------------------------------|----------------------|--------------|----------------|-----------------|
| 10         | 7 | 4 |                                      |                      |              |                |                 |
| 0          | 0 | 1 | Apple Portrait Display               | 640 x 870            | 57.2832      | 75             | 68.9            |
| 0          | 1 | 1 | Apple Two-Page<br>Monochrome Monitor | 1152 x 870           | 100          | 75             | 68.7            |
| 1          | 1 | 0 | 12-Inch Apple<br>Monochrome Monitor  | 640 x 480            | 30.24        | 66.7           | 35.0            |
| 1          | 1 | 0 | 13-Inch AppleColor<br>RGB Monitor    | 640 x 480            | 30.24        | 66.7           | 35.0            |

0 - Grounded 1 - Not Connected

Note that sense pins 4, 7, and 10 are referred to as SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

None of the RasterOps 19-inch Trinitron displays meets the above

specifications. One of their 19-inch Trinitron displays has a vertical refresh of 75Hz and a horizontal refresh of 60.241KHz. We do not think that this will work properly, but you can try it in the "Apple Two-Page Monochrome Monitor" mode.

Here are the pinouts for the Macintosh Display Card 8/24GC:

| Pin   | Description                             |
|-------|-----------------------------------------|
| ---   | -----                                   |
| 1     | Red Video Ground                        |
| 2     | Red Video                               |
| 3     | Composite Sync                          |
| 4     | SENSE0                                  |
| 5     | Green Video                             |
| 6     | Green Video Ground                      |
| 7     | SENSE1                                  |
| 8     | Not Connected                           |
| 9     | Blue Video                              |
| 10    | SENSE2                                  |
| 11    | Composite Sync and Vertical Sync Ground |
| 12    | Vertical Sync                           |
| 13    | Blue Video Ground                       |
| 14    | Horizontal Sync Ground                  |
| 15    | Horizontal Sync                         |
| Shell | Chassis Ground                          |

- 2) If no monitor is connected to the Macintosh Display Card 8/24GC, the card will, in effect, turn itself off and not accelerate the RasterOps display system. You can trick the card into thinking that a monitor is attached by grounding pin 4. This will cause the card to accelerate other displays in the system.

## Macintosh IIfx: DMA Access Support

Revised: 7/14/92  
Security: Everyone

Macintosh IIfx: DMA Access Support

=====

Article Created: 3 May 1990  
Article Last Reviewed: 13 July 1992  
Article Last Updated:

TOPIC -----

Is DMA access supported to or from NuBus memory space on the Macintosh IIfx?

Which drives will benefit from DMA on the Macintosh IIfx? Is it only internal drives? Also, is it the same for both the A/UX and Macintosh OS?

DISCUSSION -----

DMA access is supported to and from main memory -- but not to or from NuBus memory space. (The only way to access NuBus memory is through the NuBus controller chip, which is controlled by the 68030 CPU. This makes it impossible to do SCSI DMA involving NuBus memory on the Macintosh IIfx.)

Currently, only A/UX 2.0 supports the SCSI DMA capabilities of the Macintosh IIfx. SCSI DMA is possible on all SCSI devices, not just the internal SCSI device. The internal and external SCSI connectors support the same signals.

When running A/UX 2.0 on a Macintosh IIfx, any SCSI device (internal and external) will benefit from the SCSI DMA capabilities of the Macintosh IIfx.

## Macintosh: How To Get Serial Driver GPi Signal Access

Revised: 7/17/92  
Security: Everyone

Macintosh: How To Get Serial Driver GPi Signal Access

=====

Article Created: 3 May 1990  
Article Last Reviewed: 10 June 1992  
Article Last Updated: 19 July 1991

TOPIC -----

As far as I know, the Macintosh serial driver supports checking the status of the HSKi (CTS) input line but does not support the GPi (DCD) input.

With the Macintosh IIIfx, developers are encouraged not to deal directly with the serial port hardware, since the IOP is in the way. In the past, this was the only way to use the GPi signal.

Has the serial driver been extended to support the GPi signal? Support for it is necessary to properly handle high-speed modems.

DISCUSSION -----

The GPi signal is still not supported by the Macintosh serial driver.

To access the GPi line on a Macintosh IIIfx, it is necessary to turn off the IOP, as developers have done in the past on other Macintosh systems. This can be done using a control panel, called the "Macintosh IIIfx Serial Switch" cdev, available from Software Licensing. Please contact Software Licensing at (408) 974-4667 for licensing information.

## AppleTalk: Zones and Multicast Addressing Questions & Answers

Revised: 6/29/90  
Security: Everyone

AppleTalk: Zones and Multicast Addressing Questions & Answers

=====

Article Created: 3 May 1990  
Article Last Reviewed: 30 July 1992  
Article Last Updated:

TOPIC -----

Here are some questions and answers about AppleTalk zones and multicast addressing.

DISCUSSION -----

- Q) How do machines that reside in the same zone know how to communicate with other machines?
- A) Macintosh-to-Macintosh communication, such as transferring a file from a workstation to a file server, does not have anything to do with zones. The workstation knows the network number and node address of the file server and can send packets directly or through a router to the file server and vice versa.
- Q) I've heard about a name table that is used with zone multicasting. Where does that table reside, and who maintains it? Does the router or the workstation maintain it?
- A) Extended AppleTalk Phase 2 networks (EtherTalk 2.0 and TokenTalk 2.0) can have several zones defined for a single physical cable. When a user selects the zone that he wants his machine associated with, a multicast address for that zone is added to the hash table of multicast addresses that the Macintosh accepts. The hash table is maintained on the network adapter NuBus card.
- Q) Who assigns the zone multicast address, and where is it done?

- A) The multicast address for a particular zone is extrapolated from the zone name itself and is done by an AppleTalk Phase 2-compatible router on the extended AppleTalk Phase 2 network. A checksum algorithm is used by ZIP (Zone Information Protocol) to convert the zone name into a multicast address and is returned to nodes, with the multicast address for the zone that the node has selected, on the Internet through a GetNetInfo reply packet by the router.
- Q) If I have two machines on Ethernet that are in the same logical zone and one is near the router and one is 300 meters away from the router, how do these nodes interact and not cause excessive traffic on the network? What happens if the two machines are on different networks (for example, Token Ring and Ethernet)?
- A) See the first answer above. No extra packet traffic is generated.

#### Additional Information

-----

A zone on an extended AppleTalk Phase 2 Internet is an arbitrary subset of the AppleTalk nodes on the Internet. A particular network can contain nodes belonging to any number of zones. The zone list and network number range for a particular extended AppleTalk Phase 2 network (physical cable) is maintained by routers. Nodes choose their zone from a list of zones available for their network.

The only time zone multicasting comes into play is when an NBP call is made.

For example, your Macintosh is on network 1, an EtherTalk 2.0 network, and has selected zone "Campbell 2" as the zone to which it belongs. There are five other Macintosh systems on network 1; one is an AppleShare File Server and has selected the zone "Campbell 2" to belong to. The other four have all chosen "Soup 1" as their zone. Now, you open the Chooser and select the AppleShare icon. Your Macintosh sends out an NBP lookup for all AppleShare File Servers in the "Campbell 2" zone. This NBP lookup is encapsulated in an Ethernet packet with a multicast address that matches only two nodes on network 1: your node and the AppleShare File Server.

Only the AppleShare File Server node will process the packet. The others will ignore the packet because the multicast address does not match any address in their multicast address hash table. On an EtherTalk 1.0 network, every node on the network or same physical cable would have processed the packet.

## Macintosh Portable: How the Sleep State Works

Revised: 7/30/92  
Security: Everyone

Macintosh Portable: How the Sleep State Works

=====  
Article Created: 3 May 1990  
Article Last Reviewed: 30 July 1992  
Article Last Updated:

### TOPIC -----

Is there any way to make the Macintosh Portable wake up from sleep just by presenting information on the serial ports? Also, can you put the screen and the disk to sleep and still have full access to the logic card?

### DISCUSSION -----

The Macintosh Portable will wake up for various reasons but not by sensing information on the serial ports.

In sleep mode, the Macintosh Portable has all system power turned down except for the keyboard processor and the modem card ring-detector circuitry, if one is installed.

Three possible conditions will end the sleep state:

- If a key is pressed on the keyboard.
- If the wake-up timer is enabled and matches the real-time clock.
- If the Macintosh Portable internal modem is installed and set up to watch for "ring detection".

You cannot selectively put some Macintosh Portable components to sleep, except for the hard disk drive via the Portable CDEV.

## Changing Created Date on System File May Be Virus-Caused

Revised: 6/29/90  
Security: Everyone

Changing "Created Date" on System File May Be Virus-Caused

=====

This article last reviewed: 3 May 1990

TOPIC -----

Is the "Created Date" of the System file supposed to change? I have experienced this with System H1-6.0.3.

The Created Date of the System file on the original H1-6.0.3 System disk shows:  
Created: Fri, Dec 9, 1988, 12:00 PM. The Modified Date is: Tue, Jan 3, 1989, 13:05 PM. If I install the System on a formatted disk, the Created Date changes to today's date and time. The Modified Date also changes to today's date and time.

This is an intermittent problem, because sometimes the Created Date stays the same and sometimes changes. My localizer says that the Created Date is never supposed to change.

Can you explain?

DISCUSSION -----

No, it is not normal for the Created Date to change. One of the recent viruses has been known to change the Created Date of the System file. Since your customer is experiencing random crashes, we strongly suggest that the system be checked for viruses. We also suggest that the System file and the contents of the System Folder be reinstalled from known-good software. (It's probably a good idea to format the drive in the process.)

## AppleCD SC: Recognizes Four Formats

Revised: 10/29/90  
Security: Everyone

AppleCD SC: Recognizes Four Formats

=====

This article last reviewed: 22 October 1990

TOPIC -----

I want to use my AppleCD SC while running PC software on a Mac286 card. Is there any way to do this? The CDs I want to read are not available for the Macintosh yet.

DISCUSSION -----

The only CD-ROMs accessible by the AppleCD SC are those that conform to one of its recognized standards. The available AppleCD SC drivers allow the Macintosh to read CD-ROMs in these formats:

HFS  
High Sierra  
ISO 9660  
Audio

Mac286 can read any of these formats, but only as Macintosh files since that is the way the drivers present the files to the Macintosh OS. DOS drivers, which expect a CD-ROM drive attached to a card in a slot, have no way of communicating with the AppleCD SC and cannot read the CD-ROMs.

We recommend that you contact the CD-ROM vendor to see if they have versions available in one of the above formats. This would allow you to access the files directly without using Mac286 as a fix.

NOTE: Prior to being adopted by the ISO Committee, ISO 9660 was known as High Sierra. Although some minor changes were made to High Sierra during the ISO standardizing process, Apple's driver will enable you to read CD-ROM discs pressed in either format. The two format names are often used interchangeably.

## EtherTalk NB Card: Can Run Both EtherTalk & TCP/IP

Revised: 7/27/93  
Security: Everyone

EtherTalk NB Card: Can Run Both EtherTalk & TCP/IP

=====

Article Created: 15 May 1990  
Article Reviewed/Updated: 26 July 1993

TOPIC -----

Can you run EtherTalk and TCP/IP on our EtherTalk NB Card at the same time?

I need a workstation that runs MarketMax (an EtherTalk-based, client/server data feed service), has four 3270 sessions running (I'm thinking of the Netway 2000 with EtherTalk option), and has MacX for X Window System to their Sun servers (that's where TCP/IP comes in).

Will this work, and what do you think traffic will look like (MarketMax puts very little traffic on the Ethernet)? Alternative solutions might be to use a Coax/Twinax Card and MacDFT for the 3270 sessions, or use a GatorBox for the Sun sessions.

DISCUSSION -----

There should be no problem sharing the EtherTalk NB Card between EtherTalk and TCP/IP.

It is not clear whether you need many workstations or just one, and if many workstations are required, whether you need distributed sessions on those stations.

Depending on the number of workstations to be connected to the mainframe, Tri-Data Netway 2000 from Tri-Data Systems is certainly a solution; however, it might be overkill for one workstation.

Running MacDFT using the Coax/Twinax Card will work, but you will need to connect to an IBM 3X74 controller. Running MacDFT 1.1 using the Serial NB Card, you can have SNA connectivity to the host via a Front End Processor.

You can also run Avatar MacMainFrame 3.5 (from Avatar, Inc.) using Avatar SNA/SDLC card and distribute the sessions to LocalTalk, EtherTalk, or

TokenTalk.

It is difficult to predict the traffic without knowing about the network topology, the number of workstations, and the applications. Of the applications you mentioned, MacX might be the one with the most traffic, but this should be fine with one workstation.

For more information, search under: "DCA (formerly Avatar)" and "Tri-Data Systems"

Display Cards 4•8, 8•24, 8•24 GC: Monitor Video Cables (2/94)

=====

This article last reviewed: 23 Febuary 1994

TOPIC -----

What are the part numbers of the cables used to connect the new Display Cards 4•8, 8•24, and 8•24 GC to these monitors:

- High-Resolution Monochrome Monitor
- AppleColor High-Resolution RGB Monitor
- Portrait Display
- Two-Page Monochrome Monitor

DISCUSSION -----

The proper cable to use with the High-Resolution Monochrome Monitor and the AppleColor High-Resolution RGB Monitor is Apple Part #590-0161 (DB-15 to DB-15).

To connect the Portrait Display or Two-Page Monochrome Monitor to any of the new Display Cards or to the Macintosh IIci built-in video connector, use cable Apple Part #590-0615 (DB-15 to 13-pin mixed-contact D-connector).

## Think C: Troubleshooting Bus Errors

Revised: 6/29/90  
Security: Everyone

Think C: Troubleshooting Bus Errors

=====

This article last reviewed: 8 May 1990

TOPIC -----

I'm programming with Think C on a Macintosh IIci. When I try to run a Menu Management program, I get a bus error.

The source debugger that comes with Think C says that it's running into a bus error at address 0x81BBAE. A bus error implies a hardware problem, since it's trying to access memory that it doesn't have, and it is not wrapping around to pick up the unused memory. The program seems to be initializing the windows OK but crashes just before it creates the menu bar.

Can you help?

DISCUSSION -----

Actually, a bus error does not mean that you are having a hardware problem.

One of the most common causes of a bus error is a word or long word instruction being executed on an odd address. Another common cause is a program accessing an address in the range of addresses belonging to NuBus. Usually, the slot owning this address will not have a card in it.

Check the calls being made to the Menu Manager -- if you suspect these calls. Specifically, passing an invalid handle to one of the calls could definitely cause this error.

Try stepping through the code using the debugger and the variable watcher. Find the exact point where the error occurs and work your way back until you find the culprit.

AppleTalk Phase 2: Specifications Avaialable from APDA

=====

This article last reviewed: 8 May 1990

TOPIC -----

I saw a reference to the "AppleTalk Phase 2 Protocol Specification". Where can I get a copy of this?

DISCUSSION -----

The document "AppleTalk Phase 2 Protocol Specification: An Addendum to Inside AppleTalk" is available from APDA. The order number is C0144LL/A, and is described on page 101 of the Spring, 1990 APDAllog.

APDA also has many similar specifications and other useful documentation.

## Macintosh Family: Clocks Accurate to 1 Minute Per Month

Revised: 6/29/90  
Security: Everyone

Macintosh Family: Clocks Accurate to 1 Minute Per Month

=====

This article last reviewed: 8 May 1990

TOPIC -----

Can you explain why the clocks on our Macintosh systems are not keeping accurate time? (I've observed this on Macintosh II and Macintosh IIX systems.) The clocks gain as much as 2 minutes a week.

DISCUSSION -----

The real-time clock in the Macintosh family of computers is specified to be accurate to within 1 minute per month.

If the clock is gaining 8 minutes or so a month, we suspect that the clock chip may be bad. Have the computer checked by a service provider. If the problem continues, the logic board may have to be replaced.

LaserWriter IISC: Engine's Page Count Can't Be Determined

=====

This article last reviewed: 8 May 1990

TOPIC -----

Is there any way to determine the number of pages that have been printed on a LaserWriter IISC? As far as I know, the LaserWriter IISC has no counter.

DISCUSSION -----

There is no way to determine the actual number of pages that have been printed on a LaserWriter II engine, PostScript or QuickDraw.

The LaserWriter IINT and LaserWriter IINTX controller boards store the number of pages that the controller board has printed, but not the number of pages the engine has printed.

## ZUC.Virus: Causes Crazy Cursor Movement

Revised: 6/29/90  
Security: Everyone

ZUC.Virus: Causes "Crazy" Cursor Movement

=====

This article last reviewed: 8 May 1990

TOPIC -----

This article contains information on what is known as of May, 1990, about the ZUC.Virus.

DISCUSSION -----

A new virus called the ZUC.Virus has been discovered in Italy. It causes the cursor to "go crazy" within a few minutes after an infected application is run.

Preliminary information shows that it infects applications only by adding a 1256-byte piece of code at the end of the first executed CODE resource (much the same way the ANTI virus works).

Ninety seconds after an infected application is launched, ZUC.Virus takes over the cursor and moves it diagonally until you restart. After looking at the code, it seems harmless (though it can restart your machine if it can't get the memory it needs) but VERY infectious.

An infected application can be detected using VirusDetective 3.1.1 (or later), by adding the search string:

Resource Start & Pos -1256 & Data 082A#F1655#30832 ; For finding ZUC.Virus

## Macintosh Portable & PowerBook: Using Abroad (3/95)

Revised: 3/23/95  
Security: Everyone

Macintosh Portable & PowerBook: Using Abroad (3/95)

=====

Article Created: 8 May 1990  
Article Reviewed/Updated: 23 March 1995

TOPIC -----

Can the Macintosh Portable and PowerBook computers operate on voltages used internationally?

Also, will there be any damage to my data by passing my PowerBook through an airport security scanner?

DISCUSSION -----

The Macintosh Portable Power Adapter has the following specifications:

Input voltage

-----

85-270 Volts AC, 120/240 nominal (The Portable itself is rated at 70-270 Volts AC)

Frequency

-----

48Hz to 62Hz, 50/60 nominal (because it converts to DC, the frequency is almost insignificant)

The Macintosh PowerBook 100 series Power Adapter has the following specifications:

Input voltage

-----

100-240 Volts AC

Frequency

-----

50Hz to 60Hz (because it converts to DC, the frequency is almost insignificant)

The PowerBook 200 series power adapter has the following specifications:

Input voltage

-----

100-240 Volts AC

Frequency

-----

50Hz to 60Hz (because it converts to DC, the frequency is almost insignificant)

The PowerBook 500 series power adapter has the following specifications:

Input voltage

-----

100-240 Volts AC

Frequency

-----

50Hz to 60Hz (because it converts to DC, the frequency is almost insignificant)

The Macintosh Portable and PowerBook computers should work fine in any country which falls within the range of specifications above. However, you may need to use an adapter for the wall outlet itself.

The Macintosh Portable and PowerBook computers are powered by the battery at all times, even when the battery is charging. If there is a power outage, you would not lose data unless the battery had insufficient charge to power the computer.

The amount of electromagnetic interference generated by airport security systems varies widely across the world. Security systems in Europe, the Middle East, and Africa have the potential to cause more problems with internal hard disks than systems in the United States. Still, there are very few reports of X-rays or other magnetic radiation damaging computer media. The hard disk in the Macintosh is no more susceptible to problems than other hard disk systems. We suggest you have the system hand-checked whenever possible to reduce the possibility of data loss.

## 32-Bit QuickDraw: Latest Documentation Available From APDA

Revised: 4/18/91  
Security: Everyone

32-Bit QuickDraw: Latest Documentation Available From APDA

=====

This article last reviewed: 8 May 1990

TOPIC -----

I'm preparing a report on imaging model characteristics. Where can I get the latest technical documentation available for 32-Bit QuickDraw. I've seen the chapters in "Inside Macintosh, Vol. 5", but I think there must be more recent information.

DISCUSSION -----

As of May, 1990, the most comprehensive 32-Bit QuickDraw documentation is distributed by APDA: "Macintosh System Software 32-Bit QuickDraw" -- Apple Part #M0572LL/A. It contains an updated and expanded version of the materials distributed at the May 1989 Developers' Conference.

(Note that numerous other Technical Notes discuss 32-Bit QuickDraw programming issues, but they are usually more specific to writing code.)

In general, APDA is an excellent source for such information. If you are an Apple Partner or Associate developer, you will have access to information via their monthly mailings, including such resources as Phil and Dave's Excellent CD.

## Macintosh-to-NEC 370 VS Connectivity

Revised: 6/29/90  
Security: Everyone

Macintosh-to-NEC 370 VS Connectivity

=====

This article last reviewed: 8 May 1990

TOPIC -----

I want to connect a Macintosh to a NEC 370 VS computer. The data stream is in EBCDIC.

- Does the NEC require a proprietary communication package?
- Will a terminal emulator work?

DISCUSSION -----

The NEC 370 VS is based on a proprietary system that NEC describes as having four IBM emulation options: 3470, 3780, 3278 SNA, and 3270 BSC. Contact NEC's Information System Division for more specific information.

Possible Macintosh solutions include MacDFT with the Serial NB Card, or MacNetway from Tri-Data.

## A/UX: Acting As An AppleShare Server (9/94)

Revised: 9/22/94  
Security: Everyone

A/UX: Acting As An AppleShare Server (9/94)

Article Created: 8 May 1990  
Article Reviewed/Updated: 22 September 1994

TOPIC -----

Can a Macintosh IIx running A/UX also run AppleShare File Server and Print Server for 10 other Macintosh IIx stations -- all on Ethernet? Will performance be impacted?

DISCUSSION -----

There is a public domain software package called "CAP" (Columbia AppleTalk Package) available from Columbia University that allows a UNIX host to communicate using ATP (AppleTalk Transport Protocol), ASP (AppleTalk Session Protocol), PAP (Printer Access Protocol), NBP (Name Binding Protocol), and AFP (AppleTalk Filing Protocol--the client side). This package also includes software called "AUFS" (AppleTalk Filing Protocol UNIX File Server), which is the server part of AFP.

With CAP and AUFS installed in a Macintosh IIx running A/UX, we believe you can turn a it into an AppleShare File/Print server.

A/UX 3.0 supports System 7's File Share utility, enabling the system to export both UNIX and Macintosh filesystems to AppleShare clients. It does not support Printer spooling.

The Apple Workgroup Server 95 runs AppleShare Pro and AppleShare Print Server software.

## Apple IIe: Video Signal NTSC-Compatible, Not NTSC-Compliant

Revised: 6/29/90  
Security: Everyone

Apple IIe: Video Signal "NTSC-Compatible", Not "NTSC-Compliant"

=====

This article last reviewed: 8 May 1990

TOPIC -----

I bought Sharp XA305 video recorders to record the video from my Apple IIe systems: however, I am able to record only black and white pictures.

I tried the same setup with an older Sears model VCR and it worked perfectly. I tried a new camcorder and got only black and white pictures again. Sharp told me that this is because the Apple IIe has a substandard NTSC signal.

Can you help?

DISCUSSION -----

The composite video signal coming from the Apple IIe is not stated to be an NTSC-compliant signal. The signal coming from the video-out port is only considered NTSC-compatible video. "Compatible" means that generally the Apple IIe video will work with an NTSC device, although it may not work in all situations. Specifically, the Apple IIe video signal should work with all NTSC display devices.

When the Apple II was first designed, economy was of great importance. The video circuitry was built with as few parts as possible. In the design process, it was discovered that certain portions of the NTSC broadcast specification could be omitted, yet still display a color image on a standard television set. The one element that affects the described situation is color burst. The Apple IIe does not contain the color burst element of the NTSC video signal. By modulating other portions of the video signal, the Apple IIe simulates this missing information and allows an image to be produced on a television. To provide a consistent color video image for video tape, this color burst needs to be present.

In summary, the Apple IIe composite video signal was designed for display purposes, not for videotaping purposes. The Apple IIe composite signal is

close to the NTSC specification and allows the video signal to be displayed on television screens. This, however, does not indicate that the signal can be recorded. Since the signal is similar to the full NTSC specification, video sometimes records properly on videotape with certain VCRs. In other environments, the signal may not record at all. The capability to record a monochrome image falls between these extremes.

To have a true NTSC signal designed for videotaping, the Video Overlay Card is required.

## EtherTalk: History and User's Guide (3/95)

Revised: 3/22/95  
Security: Everyone

EtherTalk: History and User's Guide (3/95)

Article Created: 21 May 1990  
Article Reviewed/Updated: 22 March 1995

TOPIC -----

This article discusses the history of the EtherTalk card, EtherTalk software, and their various revisions.

DISCUSSION -----

Apple Computer introduced the EtherTalk Interface Card (now called EtherTalk NB card) and EtherTalk 1.0 software for the Macintosh II in August of 1987. Since that time, the card and software have gone through many revisions. This article describes the revisions and shows which cards and software to use on various Macintosh computers.

HISTORY  
=====

1987  
EtherTalk card revisions A through D  
EtherTalk 1.0 and 1.1 software

March 1988  
EtherTalk card revision J

The revision J card fixed a rare data corruption problem that occurred when the EtherTalk Interface card retransmitted a packet that originally had encountered a collision. The data corruption manifested itself as changed characters in documents being printed or filed on an AppleShare server. This problem only occurred in heavily loaded networks, with large numbers of active nodes, intensive use of network resources, and dissimilar types of computer equipment.

The revision J upgrade also included a fix to an incompatibility problem with some co-processor and memory expansion NuBus cards that access memory in the

\$xxxFxxx range. This problem is very unlikely to occur since most NuBus cards have their declaration ROM in this address range.

A free upgrade program to revision J was offered from May through October 1988. Some service providers extended the upgrade program on a case-by-case basis.

(Note: Some of the pre- revision J cards that were reworked were marked with revision letters G through J in order to differentiate the original version of the card. [Revision A cards became G; revision B cards became H; etc.] Revision G through J are functionally equivalent.)

July 1988

EtherTalk 1.2 software

EtherTalk 1.2 was a software workaround for an obscure hardware problem in the EtherTalk card that caused an AppleShare server on Ethernet to crash. It also fixed an obscure bug in the software that would cause the card to send packets to a non-existent node and eventually crash.

January 1989

EtherTalk card revision K

The revision K card fixed an incompatibility between earlier EtherTalk cards and the Macintosh IIcx. The problems occurred because the capacitance of a six-slot NuBus Macintosh was factored into the timing mechanism of the EtherTalk card, and was inappropriate for a three-slot Macintosh. The problem was most likely to occur when only one card was present. (This would be the case for routers and servers where no video card was necessary because they were monitored remotely, using Timbuktu for example.)

Symptoms of the problem are intermittent and include:

- system fails to boot
- system errors
- exceedingly poor network performance

No upgrade program to revision K was offered.

June 1989

EtherTalk 2.0 software

EtherTalk 2.0 offers support for AppleTalk Phase 2, including reduced broadcast traffic, extended addressing, and better router selection. EtherTalk 2.0 packets are in the 802.3 format, while EtherTalk 1.0 packets were in the Ethernet format. EtherTalk 2.0 nodes don't see EtherTalk 1.0 nodes, unless a router is setup to run both versions of the software. (See LAN Minds training for more information.)

A customer can ask their Apple Systems Engineer for the EtherTalk 2.0 software or they can send in the form located in the Upgrade and Update Programs folder under the Apple Programs icon on AppleLink. (As of this writing, the form says

it expires on March 1, 1990, but that will be changed. Note that a customer who sends in the form after March 1990 will receive EtherTalk 2.0.2, described below.)

October 1989

EtherTalk 2.0.1 software

EtherTalk 2.0.1 software offers better performance, especially on the Macintosh IIcx and IIci. The EtherTalk 2.0.1 software includes additional NOPs (no operations) in the .ENET driver in the System File, in order to synchronize the timing of the card with the timing of the faster Macintosh IIcx and IIci. The EtherTalk2.0 file that a user sees in the System Folder was not changed.

(Note: It is difficult for a customer to make sure she is using the correct version of EtherTalk software, since only the .ENET driver changed names and version number.)

December 1989

EtherTalk card Revision L

The Revision L card is a new layout of the original card (with new ROMs), removing the cuts and jumpers that were necessary for the previous upgrades. Because the card is a new layout, no upgrade program has been offered from J and K.

From the A/UX side, Rev L is required because the Macintosh IIfx is so much faster that the larger (64K) buffers are needed to keep up with the machine. Also, there were a number of NuBus interface details fixed in Rev L that the Macintosh IIfx needs. Only the A/UX drivers take advantage of the extra memory.

March 1990

EtherTalk 2.0.2 software

EtherTalk 2.0.2 software offers better performance, especially on the Macintosh IIfx. The only change to the software is that some more NOPs were added to the .ENET driver, which is installed in the System File. The EtherTalk2.0 file that a user sees in the System Folder was not changed. A customer should use the utility (mentioned above) from Technical Communications to make sure they are using the correct .ENET driver.

When a customer uses the System 6.0.5 Network Installer diskette, the new 2.0.2 .ENET driver is automatically installed, regardless of the EtherTalk installer diskette used.

Customers who upgrade to the Macintosh IIfx will be told to be sure to use the System 6.0.5 Network Installer diskette to re-install EtherTalk software.

ETHERTALK COMPATIBILITY

|          | Macintosh II or IIX                   | Macintosh IICx or IICI                               | Macintosh IIfx  |
|----------|---------------------------------------|------------------------------------------------------|-----------------|
| hardware | Rev J, K, or L                        | Rev K or L<br>(Rev L on IICI<br>with on-board video) | Rev K, L or M   |
| software | EtherTalk 2.0.1 or<br>EtherTalk 2.0.2 | EtherTalk 2.0.1 or<br>EtherTalk 2.0.2                | EtherTalk 2.0.2 |

(Note: There is a remaining bug that affects Macintosh IICI owners who use EtherTalk 2.0.1 or 2.0.2 software and the EtherTalk revision K card. Ethernet performance is adversely affected when a user starts up the Macintosh IICI in 2 bit [4 colors] or more, using on-board video. To work around this problem, the user can use a revision L card, or not use on-board video [i.e. use a video card], or use only black-and-white video.)

(Another Note: EtherTalk 2.0.x should be used in AppleTalk Phase 2 installations only. For customers who have not upgraded to Phase 2 yet, EtherTalk 1.2 is provided in a folder called Previous Version on all EtherTalk 2.x diskettes. Use the installer to install EtherTalk 2.0.x, but then drag the EtherTalk file in the Previous Version folder into the System Folder on your startup disk. This will insure that you have the correct .ENET driver in your System File, but the Phase 1 version of EtherTalk in your System Folder. See the EtherTalk NB User's Guide for details.)

## Macintosh IIfx: Termination (4/95)

Revised: 4/13/95  
Security: Everyone

Macintosh IIfx: Termination (4/95)

Article Created: 14 July 1990  
Article Reviewed/Updated: 13 April 1995

TOPIC -----

This article contains information about Macintosh IIfx termination and external terminators.

DISCUSSION -----

There have been 4 different external terminators distributed by Apple. Two are identical except for the part number.

| Part Number | Description                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -----       | -----                                                                                                                                                                                                                                                                                                                               |
| 590-0304    | The original terminator.                                                                                                                                                                                                                                                                                                            |
| 590-0695-A  | Replaces 590-0304. This is the new PLATINUM terminator                                                                                                                                                                                                                                                                              |
| 590-0695-B  |                                                                                                                                                                                                                                                                                                                                     |
| & 590-0705  | These are BLACK and are identical, except for the part number. Apple built approximately 10,000 having the part number 590-0695-B; later manufactured black terminators are numbered 590-0705. One black terminator ships with every revenue Macintosh IIfx, but can be ordered separately from Service using part number 590-0705. |
| .           |                                                                                                                                                                                                                                                                                                                                     |
| .           |                                                                                                                                                                                                                                                                                                                                     |
| .           |                                                                                                                                                                                                                                                                                                                                     |
| .           |                                                                                                                                                                                                                                                                                                                                     |
| .           |                                                                                                                                                                                                                                                                                                                                     |
| .           | Note:                                                                                                                                                                                                                                                                                                                               |
| .           | Only 1 black terminator is ever needed at a time; more details are below. These black terminators are                                                                                                                                                                                                                               |
| .           | officially called the Apple SCSI Cable Terminator II.                                                                                                                                                                                                                                                                               |

The Other Two Macintosh IIfx SCSI Bus Components

=====

#### Internal SCSI Termination Block

-----

The Internal SCSI Termination Block provides internal termination resistance for Macintosh IIfx systems WITHOUT INTERNAL HARD DRIVES. All Macintosh IIfx computers that shipped without internal hard drives had the Internal SCSI Termination Block installed. This component plugs into the Internal SCSI Filter and it looks like a "T", with a 50-pin female connector on the bottom.

#### Internal SCSI Filter

-----

The Internal SCSI Filter provides termination capacitance for internal Macintosh IIfx hard drives that shipped prior to March 19, 1990 or any third-party hard drives. After that date, Apple hard disk drives shipping in the Macintosh IIfx contained the proper termination capacitance. The filter has a 50-pin female connector on one end and a 50-pin male connector on the other. When connected to an internal drive the drive cable should be connected directly into the logic board and plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive. When there is no hard drive the SCSI Filter is connected to the logic board, and the Internal SCSI Termination Block is connected to the filter.

All Macintosh IIfx computers that shipped without internal hard drives had the Internal SCSI Filter and the Internal SCSI Termination Block installed. When you add a third-party drive remove the Internal SCSI Termination Block, but leave the Internal SCSI Filter connected to the logic board. Termination needs to be provided by the resistors on the internal third-party drive.

#### Determining What Terminators to Use and When

=====

##### No External SCSI devices Connected

-----

Termination is provided by either the internal hard disk, or by the Internal SCSI Termination Block.

##### With a Third-party Internal Drive

-----

The third-party drive should be internally terminated. Plug the drive cable directly into the logic board and plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive (Cable and filter order is important for this to terminate correctly). The Internal SCSI Termination Block needs to be removed (it looks like a "T"). Plug the drive cable directly into the logic board and plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive.

##### With Any External SCSI Devices Connected

-----

Use only ONE black terminator at the end of the SCSI chain. Make sure that all built-in terminators are removed from external third-party SCSI devices (Apple's external SCSI devices do not contain internal terminators).

NOTE:

A flyer in the Macintosh IIfx Finished Goods box instructs customers to return self-terminating SCSI devices to the Service Provider to disable the termination. Removing the termination can be performed by the user in some circumstances--a user should refer to the owners manual or check with the manufacturer if they are uncertain.

WARNING:

Under no circumstances should you use more than one black Apple SCSI Cable Terminator II on any external SCSI chain. This may damage the logic board or whatever device is providing termination power.

With An Internal Disk Drive And External SCSI Device

Both the internal SCSI drive and the last SCSI device in the external SCSI chain need termination, and you need to plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive.

Why Is There A New Black Terminator For The Macintosh IIfx?

One of the features of the Macintosh IIfx is a new SCSI chip that provides SCSI data transfer rates up to 3MB per second, faster than any earlier Macintosh systems. To achieve these transfer rates, components on the Macintosh IIfx logic board are smaller and faster, this makes them more susceptible to signal reflections on the cable. The new terminator adds the filter capacitors and changes the resistor values for some of the signals to reduce the reflections.

How Can Third-party Drives Take Advantage Of The Higher Scsi Throughput?

Any SCSI hard drive that can sustain transfer rates above 1.25MBps will operate faster on a Macintosh IIfx. No Apple hard drive, including the HD160 SC, takes advantage of this higher transfer rate.

What To Do With Less Common System Configurations

In some remote cases someone might remove the internal drive from a Macintosh IIfx they will not have the correct internal termination. In this situation, you should order and install a Internal SCSI Termination Block (Apple Service Part #590-4515) and Internal SCSI Filter (Apple Service Part #590-4516), and use the black terminator if you have any external drives; however, if you don't have access to an internal termination block, you can connect use the new platinum terminator (590-0695-A on the terminator) to the beginning of the SCSI chain and, as always, connect the black terminator at the end of the chain. Again, what is preferred is to order the Internal SCSI Filter from service.

## NuBus Speed Benchmarks (1/96)

Revised: 1/10/96  
Security: Everyone

NuBus Speed Benchmarks (1/96)

=====

Article Created: 11 May 1990  
Article Reviewed/Updated: 10 January 1996

TOPIC -----

I need NuBus specifications for speed, bandwidth, throughput, and relationship to processor speed.

DISCUSSION -----

The following specifications are not TRUE benchmarks, but can be used as a primer to understand the variables influencing the "relative" throughput of NuBus.

Though the NuBus speed is designed to be processor- and architecture-independent, it varies depending on the NuBus card and Macintosh used. We don't have specific benchmarks, but in general, the NuBus "throughput" ranges from around 7MB to 37MB per second depending on the Macintosh, NuBus card, and application used. Generally, increases in NuBus throughput are influenced more by the NuBus card's design and function than by the use of a "faster" CPU.

NuBus throughput is faster on a Macintosh IIsi, Macintosh IIfx, or the Macintosh Quadra computers, because the processor clock rate is faster than the 16MHz for other Macintosh II computers. These Macintosh computers, therefore, are faster at bus arbitration on the processor side, and the processor responds faster to NuBus accesses. For example, the increase in speed with the Macintosh IIfx is approximately 20 to 30 percent when going out to NuBus or coming back.

The typical time required to go from the processor bus to the NuBus card is about 700ns, as is the time in reverse: going from the NuBus card back to the processor. The time remains constant whether moving 1 or 4 bytes of data. (These times are representative of the Macintosh II using the Macintosh II Video Card.)

Other cards, such as the Macintosh 1-Bit Video Card, support what we call "dump and run." A Macintosh II has a transfer rate of about 20MB using this card because each 4-byte write-only takes only 200ns, and the data goes right into video RAM on each cycle. This card immediately acknowledges each cycle on a write, whereas the Macintosh II Video Card could take more than one cycle for the data to move into RAM.

Cards that support the NuBus burst mode could achieve transfer rates of up to 37.5MB when going from NuBus card to NuBus card, which is the case with some graphics accelerator cards to video cards. With these cards, the first access takes 200ns, and each subsequent access up to 16 takes only 100ns.

Because of the overhead processing video, any performance increase over one of the other Macintosh II computers is negated when using a Macintosh IIfx or Macintosh IIsx with the internal video in 8-bit mode. Setting the internal video to 1-bit, or having a NuBus video card, will ensure maximum NuBus performance in these systems.

Note: For information about Macintosh computers based on the 68040 or PowerPC microprocessors, see these related articles in the Tech Info Library:

## PC-LAN Baseband Network Description

Revised: 6/29/90  
Security: Everyone

PC-LAN Baseband Network Description

=====

This article last reviewed: 11 May 1990

TOPIC -----

This article contains a description of IBM's PC-LAN Baseband.

DISCUSSION -----

IBM has two different networking schemes that are referred to as PC-LAN: Baseband and Broadband. Baseband is their system recommendation for K-12 labs.

Using the PC Network Adapter-II in the XT bus machines, such as the original PC and PS/2-25/30, and the PC Network Adapter II/A for the MicroChannel machines, it is a 2Mbps CSMA/CD protocol run over unshielded, twisted-pair telephone wiring. The network uses the IEEE 802.2 LLC standard like AT&T StarLAN. A typical configuration is cabled in daisy-chain fashion using RJ-11 telephone jacks and telephone cabling with up to eight stations within a maximum 200-foot chain compared to a 4000-foot network limit with PhoneNET.

NetBIOS support is not provided directly on the card; it is via two software products, the PC Network Protocol Driver and the LAN Support Program. This network does not support 8022 LLC protocol or APPC/PC, which limits available application memory.

The PC-LAN Baseband network can be enlarged using the IBM 5173 PC Network Baseband Extender, which has 10 ports. The network can be extended to 10 arms of eight workstations each, and the length of the daisy-chain arm is extended to 400 feet using the Extender. This means that the radius of a PC-LAN Baseband network cannot exceed 400 feet, significantly less than LocalTalk and PhoneNET networks. The maximum network is 80 stations unless a router is used to bridge multiple networks together or to jump to another topology, such as Ethernet or Token Ring.

## Macintosh Portable: Where To Get Power Adapter

Revised: 6/20/94  
Security: Everyone

Macintosh Portable: Where To Get Power Adapter

=====

Article Created: 11 May 1990  
Article Last Reviewed: 30 July 1992

TOPIC -----

I need an extra power cord (with transformer on one end) for my Macintosh Portable. How? Where?

DISCUSSION -----

Two ways to obtain the Power Adapter/Charger are:

- 1) Through a reseller or "service"; Apple Part number for the U.S. version is 699-0505.
- 2) Through finished goods; it is included with the Macintosh Portable Battery Recharger, Apple Part #M0275.(Discontinued)

## HyperCard XCMD To Create Business Charts

Revised: 6/29/90  
Security: Everyone

HyperCard XCMD To Create Business Charts

=====

This article last reviewed: 21 May 1990

TOPIC -----

I need to make adaptable business charts that run in conjunction with HyperCard. Any suggestions?

DISCUSSION -----

A set of XCMDs called HyperGraph is available that can generate full-page business charts in color or black and white.

HyperGraph supports:

- Full-page display
- Color (256/16 million) with individual control for each object
- All fonts available in the System file
- 10 different types of graphs: pie, bar, horizontal bar, line, and point charts in color or black and white
- Three dimensional graph generation
- Auto-update between HyperCard and the graphics routines with HyperCard (When you modify a field under HyperCard, the graphic is updated automatically.)
- 32-Bit QuickDraw
- Screen generator to import text file and generate a HyperCard Card

For further information, send an AppleLink to "VANNIER.A".

## Mac241 Prints to ImageWriter LQ Unidirectional Only

Revised: 6/29/90  
Security: Everyone

Mac241 Prints to ImageWriter LQ Unidirectional Only

=====

This article last reviewed: 11 May 1990

TOPIC -----

I print from White Pine's Mac241 to an AppleTalk ImageWriter LQ and want the printer to default to bidirectional/Draft mode instead of unidirectional/Best Quality. Mac241 gives only a Page Setup box and not a Print Options box.

Is it possible to alter the AppleTalk ImageWriter LQ driver to change the default settings?

DISCUSSION -----

If the driver was modified in this way, the software would then be unsupported.

White Pine Software confirmed that the software does not offer the user a choice of unidirectional of bidirectional.

## PMMU Adds Clock Cycle to Memory Access

Revised: 7/20/92  
Security: Everyone

PMMU Adds Clock Cycle to Memory Access

=====

Article Created: 11 May 1990  
Article Last Reviewed: 20 July 1992  
Article Last Updated:

TOPIC -----

Is there any reason that a Macintosh II with 8MB of RAM would slow down with a PMMU installed? My Macintosh II seems to be slower with the PMMU.

DISCUSSION -----

Installing a Paged Memory Management Unit (PMMU) in a Macintosh II should not cause it to operate slower than a Macintosh II with the original Address Management Unit\* (AMU) installed. Each device adds a clock cycle to memory access and, therefore, requires a second wait state.

The 68030 processor used in other members of the Macintosh II family has the equivalent of a PMMU built-in, and thus does not require the extra clock cycle for memory access. This allows a 68030-based Macintosh to run approximately 8 to 10% faster than a Macintosh II.

\* Also known as the Hochsprung Memory Management Unit (HMMU), named after its designer, Ron Hochsprung.

## Macintosh II Family: Monitor Power Receptacle Power Limit

Revised: 6/29/90  
Security: Everyone

Macintosh II Family: Monitor Power Receptacle Power Limit

=====

This article last reviewed: 11 May 1990

TOPIC -----

How much power can a monitor connected to the Macintosh II or Macintosh IIfx monitor input receptacle consume? I know how much the AppleColor RGB monitor consumes (160W), but is it possible to have a monitor connected that consumes more power?

DISCUSSION -----

Three amps at 110 volts (1.5 amps at 220 volts) is the maximum amount of power that can be drawn from any Macintosh II monitor power input receptacle. This means that 330 watts is the maximum wattage that can be pulled from the monitor power input receptacle.

## MacDraw: Precision Bitmap Alignment

Revised: 6/29/90  
Security: Everyone

MacDraw: Precision Bitmap Alignment

=====

This article last reviewed: 21 May 1990

TOPIC -----

If a rectangle is created in MacDraw and two copies are printed to a LaserWriter, one may measure 150mm x 200mm, yet the other may measure 151mm x 201mm. There is a variation in both dimensions. Sometimes, however, they may match perfectly.

I'm using the LaserWriter in a four-layer printing process and find this inconsistency very annoying to work with.

Since the variation is in both dimensions and the age of the LaserWriter is relatively new, I believe that the paper weight (which is within specification), the paper finish, and the age of the LaserWriter are unlikely to be possible causes of the problem.

I would be satisfied if the LaserWriter fell within a specification, but since there is no specification outlining the acceptable variations, I am having problems.

Can you help?

DISCUSSION -----

The size variance described is a result of PostScript interpretation of the bitmapped image. This results from attempts to change a 72-dpi image into a 300-dpi image. This is not an exact ratio. There may be as much as a 4% variance in PostScript's interpretation. PostScript's attempts at correction may vary slightly during each pass.

To compensate for this difference, choose Page Setup from the File menu. On the right side of the Page Setup dialog box there is an Options button. Click this button, and an additional dialog box appears. The fourth checkbox is labeled Precision Bitmap Alignment (4% reduction). Be sure this checkbox is

marked. Using this option increases the printing time; however, the printouts will be consistent during each pass.

## Using Sony Monitors With Display Card 8/24GC

Revised: 6/29/90  
Security: Everyone

Using Sony Monitors With Display Card 8/24GC

=====

This article last reviewed: 21 May 1990

TOPIC -----

I want to use the Sony MultiScan CPD-1304 monitor with the new Display Card 8/24GC. Will this work?

DISCUSSION -----

If the CPD-1304 monitor works with the Macintosh High-Resolution Video Card (the current 8-bit display card), there won't be any problem with the Display Card 8/24GC signals driving the Sony CPD-1304. (We have not been able to verify that the CPD-1304 monitor works with the Macintosh High-Resolution Video Card, but we do know that Sony's CPD-1302 monitor works with that card.) However, you will need to use a different cable to connect the two devices because the cards have different connectors.

An issue with regard to the cable concerns the sense pins, which tell the card what type of monitor is attached. For the Sony CPD-1302 monitor, the sense pins should be configured as below, where 0 = Ground and 1 = Not Ground. To ground a sense pin, tie it to the C&VSYNC.GND signal.

| Sense pins |   |   | Display                | Hor x Vert | Dot   | Vert    |
|------------|---|---|------------------------|------------|-------|---------|
| 10         | 7 | 4 |                        | Pixels     | Clock | Refresh |
| -----      |   |   | -----                  | -----      | ----- | -----   |
| 1          | 1 | 0 | 12" Monochrome Monitor | 640 x 480  | 30.24 | 66.7    |
|            |   |   | 13" Color Monitor      |            |       |         |

Here are the pinouts for the Macintosh Display Card 8/24GC:

| Pin   | Signal  | Description      |
|-------|---------|------------------|
| ----- | -----   | -----            |
| 1     | RED.GND | Red Video Ground |

|       |             |                                          |
|-------|-------------|------------------------------------------|
| 2     | RED.VID     | Red Video                                |
| 3     | CYSNC~      | Composite Sync                           |
| 4     | MON.ID1     | Monitor ID, Bit 1 (also known as SENSE0) |
| 5     | GRN.VID     | Green Video                              |
| 6     | GRN.GND     | Green Video Ground                       |
| 7     | MON.ID2     | Monitor ID, Bit 2 (also known as SENSE1) |
| 8     | nc          | (no connection)                          |
| 9     | BLU.VID     | Blue Video                               |
| 10    | MON.ID3     | Monitor ID, Bit 3 (also known as SENSE2) |
| 11    | C&VSYNC.GND | CSYNC & VSYNC Ground                     |
| 12    | VSYNC~      | Vertical Sync                            |

## Rocky Mountain BASIC: No Exact Equivalent for Macintosh

Revised: 6/29/90  
Security: Everyone

Rocky Mountain BASIC: No Exact Equivalent for Macintosh

=====

This article last reviewed: 21 May 1990

TOPIC -----

I'm using Rocky Mountain BASIC on an HP. Is there a similar package for the Macintosh?

DISCUSSION -----

The only implementation of BASIC for the Macintosh that is remotely similar to "Rocky Mountain BASIC" for the HP9000 series is Microsoft QuickBASIC. There are numerous differences, however, especially considering the machine-specific details of each BASIC. Rocky Mountain BASIC uses many commands and parameters that mean nothing to computers other than HP9000 systems. Likewise, Microsoft QuickBASIC uses Macintosh-specific commands that do not exist on other computers, as well as command syntax in traditional Microsoft BASIC style -- a style much different than that of Hewlett Packard's BASIC.

They do share the important ability to use subprograms and functions, but the method of implementing these is quite different between the two languages. Microsoft QuickBASIC would give your customer a powerful BASIC, but porting anything other than the simplest programs from Rocky Mountain BASIC will not be a trivial task -- especially with programs that are I/O-intensive because these tend to be the areas where the languages differ the most.

There are some definite benefits to using Microsoft QuickBASIC over HP's BASIC, such as advanced debugging features (breakpoints and animated tracing for source-level debugging) as well as the simpler mouse interface. Users can quickly grow accustomed to the Microsoft QuickBASIC product, while Rocky Mountain BASIC has a cruder interface and takes more time to master. Of course, you are already using Rocky Mountain BASIC, so the change in programming environment will be dramatic; to what degree depends on how familiar you are with Macintosh user interface conventions.

If you need additional information on Microsoft QuickBASIC, we suggest that you

contact Microsoft directly. They should be able to provide more up-to-date information and could, perhaps, assist in deciding if their product will fit your requirements.

## LaserWriter IINTX With Hard Drive: How Fonts Are Accessed

Revised: 6/29/90  
Security: Everyone

LaserWriter IINTX With Hard Drive: How Fonts Are Accessed

=====

This article last reviewed: 23 May 1990

TOPIC -----

Can you explain how the AppleShare Print Server handles an attached hard drive on a LaserWriter IINTX? That is, if the hard drive has many fonts installed, does the print server know to get "downloadable" fonts from the hard drive, or does it go back to the Macintosh?

DISCUSSION -----

The fonts installed on the LaserWriter IINTX hard drive appear as though they were in the LaserWriter IINTX ROM. Adobe and Apple designed the hard drive option so that the LaserWriter IINTX operates transparently, and the user can access additional fonts without having to download them with utilities.

Macintosh Portable Power Adapter: Specifications (Discontinued)

=====

Article Created: 23 May 1990  
Article Last Reviewed: 30 July 1992

TOPIC -----

What are the specs on the Macintosh Portable Power Adapter?

DISCUSSION -----

The Macintosh Portable Power Adapter has the following specifications:

Input voltage: 85VAC to 270VAC, 120/240V nominal  
Frequency: 48Hz to 62Hz, 50/60Hz nominal

(NOTE: You may encounter problems with power plug compatibility; an adapter will probably be required.)

## Token Ring Nodes: Physical or Logical Unit Issues

Revised: 6/29/90  
Security: Everyone

Token Ring Nodes: Physical or Logical Unit Issues

=====

This article last reviewed: 23 May 1990

TOPIC -----

Are Macintosh Token Ring workstations addressed as PUs or LUs?

DISCUSSION -----

Nodes are either a physical unit (PU) or a logical unit (LU) in an SNA environment.

A Macintosh system with a TokenTalk NB Card running MacDFT or MacAPPC is a downstream PU. A Macintosh system running TokenTalk is neither a PU nor LU -- these terms do not apply unless MacDFT or MacAPPC is being used.

## Display Card 8•24 GC: Questions and Answers (11/94)

Revised: 11/7/94  
Security: Everyone

Display Card 8•24 GC: Questions and Answers (11/94)

Article Created: 25 May 1990  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

Here are some questions and answers about the Macintosh Display Card 8•24 GC.

DISCUSSION -----

Q) The card supports NuBus master and slave block transfer modes. I was under the impression that not all Macintosh models support block transfer mode.

- a) Does this imply that there are third-party video cards that DO support block transfer? If yes, do you know the manufacturers' names?
  - b) Will the Display Card 8•24 GC run even faster when talking to one of these video cards (faster than without block transfer, but still not as fast as the on-board video)?
- A) The Macintosh IIfx does support slave block transfer mode; the other Macintosh models do not have this support. The Display Card 8•24 GC block transfer function is primarily for use between NuBus cards with block transfer abilities.
- a) We currently do not know of any third-party cards that support block transfer. Beside the Display Card 8•24 GC, the only video card we know of that supports block transfer is the Display Card 8•24 in its 8-bit mode.
  - b) The Display Card 8•24 GC would accelerate a second card that has block transfer to a greater degree than it would accelerate a second card that does not have block transfer. The second card (with block transfer) would not run as fast as the Display Card 8•24 GC performing all operations itself. (We assume that "on-board video" means the video on the Display Card 8•24 GC as opposed to logic board video, like on the Macintosh IIfx.)

Q) It seems that the use of off-screen bitmap algorithms actually slow down the Display Card 8•24 GC.

a) Is this true?

b) How does adding DRAM to the card boost off-screen performance?

c) Do I need to rework my graphics code to use it?

A)

a) We are unsure what you are asking -- slow down the Display Card 8•24 GC compared to what? If this is in reference to moving off-screen bitmaps across NuBus compared to using the local DRAM for off-screen bitmaps, the answer is yes, moving bitmaps across NuBus is slower than using the local DRAM.

b) When DRAM is installed on the card, it is automatically used for off-screen bitmaps.

c) Since the off-screen bitmaps automatically and transparently use the DRAM, there is no need to change an application's code to take advantage of this function.

Q) More generally, do you have any information that outlines all the factors that determine the ultimate speed of any graphic operation? For example:

a) Speed of the CPU running QuickDraw routines relative to AM29000 speed. (How much faster is the AM29000 QuickDraw than the regular Macintosh version?)

b) On-screen versus off-screen algorithms.

c) On-board video versus third-party video cards.

d) Effect of various NuBus byte lane width specifications when transferring data from one board to another.

e) 1-bit versus 8-bit or more graphics.

A)

a) This depends on the action being taken; a straight line from point A to point B will not benefit to the degree that a complex polygon would. The AM29000 performance is from 5 times to 30 times faster than unaccelerated performance.

b) The creation of the on-screen image and off-screen image will be equal. Since only QuickDraw variables and small data structures are moved across NuBus, there is an improvement in this image creation compared to standard video cards. However, the biggest benefit is when the previously created off-screen image is moved onscreen.

c) We are not sure what is being asked. We do not have specifications for third party-cards. (We hope this is the information being

requested.) Typical reads and writes from the Macintosh to display cards are performed in 1000 and 500 nanoseconds, respectively. (This is what we believe you are requesting for the standard video cards.) The Display Card 8•24 GC and writes to its frame buffer (off-screen bitmaps in DRAM) at a rate of 66 reads 60 132 nanoseconds. (This is what we believe you are requesting for the on-board video specifications.)

- d) We have not been able to locate an answer for the byte lanes issue. We will do our best to provide details on this in a later response.
- e) The following applies during image movement from Macintosh memory across NuBus to standard video cards or during image movement from Display Card 8•24 GC frame buffer to Display Card 8•24 GC display:

When moving 24-bit images, you are moving 4 times as much data than moving 8-bit images and 24 times as much data than moving 1-bit images. When moving 8-bit images, you are moving 8 times as much data than moving 1-bit images.

The movement of image data from Macintosh memory to the Display Card 8•24 GC is different because only variables and small portions of data structures are being moved across NuBus--not large, deep bitmap images. There is a small increase in the amount of data sent as you move from 1-bit to 8-bit to 24-bit; however, 8-bit and 24-bit are very close. The bitmaps grow dramatically; the variables and data structures remain relatively flat.

Q) When does the Display Card 8•24 GC accelerate third-party cards?

- A) The Display Card 8•24 GC accelerates other video cards via its pseudo-block transfer. This is similar to block transfer in that it claims the bus for a 16 NuBus data word transaction, but different in that it must send an address word for each data word that it sends. The extra transfer activity makes pseudo-block transfer slower than block transfer, but it is still an improvement over normal NuBus access times.

## Macintosh SE: Color QuickDraw Print Restrictions

Revised: 6/29/90  
Security: Everyone

Macintosh SE: Color QuickDraw Print Restrictions

=====

This article last reviewed: 23 May 1990

TOPIC -----

I created a PowerPoint document with a number of colors defined. The document printed without problems to a 35mm slidemaker from their Macintosh II, but when I printed the document from a Macintosh SE, I could print only eight colors.

- 1) Can you receive the same color printout results from a Macintosh SE or any Macintosh?
- 2) Are there restrictions when printing color from a Macintosh SE?

DISCUSSION -----

- 1) Macintosh Plus, Macintosh SE, and prior models support only the eight colors that are available in the original QuickDraw. All Macintosh II computers and the Macintosh SE/30 support Color QuickDraw, which provides 256 colors. Therefore, using original QuickDraw (Macintosh Plus, Macintosh SE, and earlier) provides eight colors; while using Color QuickDraw (Macintosh II family and Macintosh SE/30) provides 256 colors. However, please note the third-party issues below.
- 2) There is a limit of eight colors as supported by the ROMs in the Macintosh SE. However, please note the third-party issues below.

Some third parties have devised methods to work around the limits imposed by the Macintosh ROMs. Some third-party film recorders (slidemakers) do not work with the Macintosh SE/30 under Color QuickDraw, but work on the Macintosh SE/30 by assigning colors to be equal to certain black and white patterns. (This also may be supported on the Macintosh SE and Macintosh Plus.)

Other third-party products can print Macintosh II 8-bit color images from a Macintosh SE/30 without any changes. Without knowing which 35mm film

recorder is in use, we cannot tell you the limits the product imposes on the Macintosh. To understand these limits, check the film recorder documentation.

## Macintosh: Protecting the System Folder from Tampering

Revised: 7/30/90  
Security: Everyone

Macintosh: Protecting the System Folder from Tampering

=====

This article last reviewed: 13 July 1990

TOPIC -----

I need to prevent my users from changing or removing resources from their System Folders. Do you know of a good way to do this?

I have already made the System Folders invisible with ResEdit. Are there any potential problems with this approach?

DISCUSSION -----

System Software 6.0.x will not run INITs from invisible files. Because your files are visible (but the folder is not), this should not be a problem. However, other applications may have problems with this method.

A better, but more expensive, solution would be to use a security package (such as Empower, from Magna) which supports password protection of specific folders. Another solution is Casady & Greene's Access Managed Environment (A.M.E.), an integrated security and virus program with numerous utility-like options (activities log, passwords, auto sign on/off, etc) for the individual or multiple users.

## Converting Apple III Text Files to Macintosh

Revised: 6/29/90  
Security: Everyone

Converting Apple III Text Files to Macintosh

=====

This article last reviewed: 23 May 1990

TOPIC -----

I'm trying to transfer some text files on Apple III disks to 3.5- inch floppy disks so I can open the files on a Macintosh. What cables and software are needed for this?

DISCUSSION -----

If you still have the Apple III, the files can be transferred using Access III, MacTerminal, and either cable (Apple Part #) 590-0555 or cables 590-0169 AND 590-0550.

If using the Apple III serial card, have the card set to no modem eliminator. If using the built-in port C, make sure you're using the .RS-232 driver rather than the .PRINTER driver. You can find the .RS-232 driver for the built-in port C on the System Utilities Data disk.

Make sure both systems are set for the same baud rate, data bits, and so forth, and then simply set one system up to send a file and the other one to receive a file.

If only the disks are available, you can use this method. Because Apple III SOS and Apple II ProDOS are file-compatible, using an Apple IIe, Apple IIGS, or Apple IIC with both a 5.25-inch disk drive and a 3.5-inch disk drive, transfer the files to a 3.5-inch disk. Use AFE to transfer the files to the Macintosh disk.

Both of these options assume that the files are text-only. If they are QuickFile or Three Easy Pieces files, see the Tech Info Library for instruction on converting the files to Microsoft Works.

Another option would be to have an outside service, such as Pivar, convert the files for you.

## Using an ADB Keyboard With the Macintosh Portable

Revised: 7/28/92  
Security: Everyone

Using an ADB Keyboard With the Macintosh Portable

=====

Article Created: 23 May 1990  
Article Last Reviewed: 28 July 1992  
Article Last Updated:

TOPIC -----

Can the Apple Extended Keyboard be used with the Macintosh Portable? I will be using the keyboard while the Macintosh Portable charger is plugged in.

DISCUSSION -----

Yes, the Apple Extended Keyboard (the original as well as the Extended Keyboard II) can be used with the Macintosh Portable, as can the Apple Standard Keyboard and other ADB devices that follow our specifications. The differences will be in key layout, battery drain, and waking up the Macintosh Portable.

The Apple Standard Keyboard draws a maximum of 100mA, and the Apple Extended Keyboard draws a maximum of 85mA. The Macintosh Portable keyboard and keypad (or trackball) together draw 75mA. From these numbers, you can see that adding the Extended Keyboard more than doubles the ADB power requirements. This decreases battery life somewhat. Since you will be using the Extended Keyboard with the charger plugged in, this shouldn't affect you.

Another point, though minor, is that the only way to manually wake up the Macintosh Portable is by pressing a key on the built-in keyboard. External ADB keyboards cannot provide this functionality. You will have to power up the Macintosh Portable by pressing a key on the built-in keyboard instead of the externally attached ADB keyboard.

## Macintosh IIfx: UN8 PROG CELL Socket Explanation

Revised: 7/14/92  
Security: Everyone

Macintosh IIfx: UN8 PROG CELL Socket Explanation

=====

Article Created: 23 May 1990  
Article Last Reviewed: 13 July 1992  
Article Last Updated:

TOPIC -----

What is the function of the slot labeled "UN8 PROG CELL" on the Macintosh IIfx main logic board?

DISCUSSION -----

The UN8 PROG CELL socket on the Macintosh IIfx logic board is for the parity memory controller.

This is only present on those Macintosh IIfx computers that are originally ordered with the parity option. There is no way to upgrade a non-parity Macintosh IIfx to have the parity option.

## MacDFT Support With IBM 3274 Cluster Controller

Revised: 6/29/90  
Security: Everyone

MacDFT Support With IBM 3274 Cluster Controller

=====  
This article last reviewed: 23 May 1990

TOPIC -----

I am trying to configure the 3274-51C cluster controller. The IBM people said that the cluster controller has four types of configuration, A, B, C, and D. This cluster controller has "Configuration Support A-C", and extended memory is needed for "Configuration Support D".

- 1) Can I connect the Macintosh to the 3274-51C setup with "Configuration Support A, B, or C"?
- 2) Will MacDFT run this way?

DISCUSSION -----

Twelve different models of the 3274 are available. The suffix after the model number indicates the environment in which the controller is used.

- The "A" suffix indicates a channel-attached SNA environment.
- The "B" and "D" suffix indicate a channel-attached non-SNA environment.
- The "C" suffix indicates a remotely attached environment.

Models 21, 31, and 41 support up to 32 attached devices. Model 51 supports 12 devices, and Model 61 supports 16 devices.

Most 3274 control units are capable of supporting DFT devices. Generally, the hardware does not determine whether a control unit can support DFT. Rather, the control units' microcode software supplies the additional function necessary to support DFT. However, minimum memory requirements are necessary for DFT support. In some cases, 3274 control units may require memory upgrades to have enough memory for DFT support.

Assuming you have enough memory, MacDFT will run with the above configuration if the controller microcode is 65 or higher. In remote bisynchronous, you can run MacDFT only in CUT mode.

## Running MacDFT on a Token Ring through PS/2

Revised: 6/29/90  
Security: Everyone

Running MacDFT on a Token Ring through PS/2

=====

This article last reviewed: 23 May 1990

TOPIC -----

I'm installing Macintosh IIci systems with TokenTalk NB Cards using MacDFT software. I will be routing the packets through a PS/2 with an AppleShare PC Card installed to their front-end processor (3745) to the host. I want to be sure that I won't have any problems routing their packets through the PS/2.

DISCUSSION -----

First, we are not clear how the AppleShare PC Card is used in this situation since it is not needed for communication to the host.

We assume that the PS/2 is on the Token Ring that is attached to the front-end processor using a Token Ring Interface Coupler (TIC). MacDFT 1.1 running over the TokenTalk NB Card on the same Token Ring can communicate directly to the TIC/front-end processor without going through the PS/2.

## EtherPort Installer Upgrade for System 6.0.4 & 6.0.5

Revised: 6/29/90  
Security: Everyone

EtherPort Installer Upgrade for System 6.0.4 & 6.0.5

=====

This article last reviewed: 23 May 1990

TOPIC -----

This article contains information on an upgrade for Novell's EtherPort installers.

DISCUSSION -----

Novell has updated their installers to work with System Software 6.0.4 and 6.0.5. You can obtain the updated installers from Novell, or install the drivers on a system running System Software 6.0.4 or 6.0.5 using this workaround:

To install Novell EtherPort drivers on systems running System Software 6.0.4 or 6.0.5:

- 1) Start up the system from a 6.0.4 or 6.0.5 System Tools disk.
- 2) Eject the Tools disk.
- 3) Insert the Novell Installer disk and execute the Installer from that disk.

Be prepared to swap the disks a few times when prompted by the Installer program. This procedure differs from the normal install procedure of starting up from the Installer disk.

To obtain the new Installer disk, contact Novell. Note that there are two different updated versions of the Installer program for the two different Novell EtherPort II cards distributed:

|                    |                                                                      |
|--------------------|----------------------------------------------------------------------|
| Version 2.5 Rev e  | This is for the "Intel" or long EtherPort II card.                   |
| Version 3.25 Rev b | This is for the "National Semiconductor" or short EtherPort II card. |

## KanjiTalk: Running U.S. Applications

Revised: 9/17/92  
Security: Everyone

KanjiTalk: Running U.S. Applications

=====

Article Created: 27 May 1990

### Article Change History

-----

09/16/92 - UPDATED

- To clarify how to mix English and Kanji applications.
- To make it clear that Macintosh hardware is generic.

### TOPIC -----

Can any Macintosh operating system version be mixed with any application on a Kanji Macintosh? For example, could while running U.S. System 6.0.x with Kanji fonts, could I run the English versions of MacWrite II and PageMaker and print in Kanji on a Kanji LaserWriter?

### DISCUSSION -----

Sometimes, you can successfully run a "U.S." application with KanjiTalk (and have a Kanji script appear in the data space and print in a Kanji script to a LaserWriter IINTX-J). However, if it hasn't been localized properly, you may encounter many more problems (and these of a possibly more serious nature) compared to mixing and matching applications and operating systems localized for other countries. Most English applications don't support the 2-byte character set. Exceptions exist with applications like Excel or WordPerfect.

A well-mannered U.S. application that uses the Script Manager (which makes it possible for it to support non-Roman scripts: Arabic, Hebrew, Japanese, and Chinese) may be functional (with minor incompatibilities) or usable (with somewhat minor inconveniences). Some likely incompatibilities include text-positioning problems requiring you to press the backspace key twice, incorrect date and time formats, different numerical and character delimiters, and so on. (Remember: Kanji uses a 2-byte-wide word.) With other less-compatible applications, serious system bombs may occur at any time, including when changing font parameters or printing a PostScript font.

Generally, you may have fewer problems using graphic-oriented packages than text-oriented packages.

You can use any operating system on a any Macintosh, keyboard differences aside.

Although you can usually use a non-U.S. (or other) word processor with the U.S. Macintosh OS, or vice-versa, we do not recommend using non-Kanji applications with the Kanji OS, or vice-versa.

## A/UX: How To Partition 45MB Removable Drive

Revised: 8/28/90  
Security: Everyone

A/UX: How To Partition 45MB Removable Drive

=====

This article last reviewed: 21 May 1990

TOPIC -----

I would like to format and partition a 45MB removable cartridge for use with A/UX. Because HD SC Setup does not recognize the Mass Microsystems 45MB removable drive, can this be done? I seem to remember a command called "dformat" from prior UNIX experience with a Plexus machine.

DISCUSSION -----

According to Mass Microsystems, their 45MB removable drive does not work under A/UX at this time. It works only under Macintosh OS.

Fortunately, we found a solution by the Usenet comp.unix.aux newsgroup at Stanford University. They posted a fix for the SyQuest SQ555 44MB (and possibly other) removable hard disk drives to work under A/UX 1.1.

We tried the patch program under Macintosh OS, and it does work under A/UX 1.1. Basically, the patch program sets the Error Page Parameter correctly so that the parameters are compatible with A/UX.

## A/UX: How to Reformat a Third-party Disk for Macintosh OS

Revised: 6/29/90  
Security: Everyone

A/UX: How to Reformat a Third-party Disk for Macintosh OS

=====

This article last reviewed: 21 May 1990

TOPIC -----

I'm working with a large number of A/UX systems with A/UX configuration on Maxtor 200MB disks. However, we need to reinitialize some of the Maxtor disks to all Macintosh OS. Of course, Apple's HD SC Setup doesn't recognize these disks. Can you suggest a disk-formatting product that would successfully reinitialize them?

DISCUSSION -----

How did you format the Maxtor 200MB disks to work under A/UX? You would have needed some type of disk formatter or partition software to format the Maxtor 200MB disks to work under A/UX.

Here are two ways to reinitialize the Maxtor 200MB disks for Macintosh OS only:

- 1) Since it is an A/UX disk, you can use "dp" under A/UX to repartition the entire disk into a single Macintosh partition. To do this, remove all of the "Apple\_UNIX\_SVR2" partition types and enlarge the Macintosh "Apple\_HFS" partition types.

Note: Do not delete the "Apple\_Partition\_map" and "Apple\_Driver" partition types.

- 2) Use the Macintosh hard-disk management software called "Silverlining" from La Cie Ltd. For more details, search the Technical Info library under "La Cie."

## GS/OS Disk Dialog Enhancement Request

Revised: 6/29/90  
Security: Everyone

GS/OS Disk Dialog Enhancement Request

=====

This article last reviewed: 21 May 1990

TOPIC -----

A school wants to "alter" the way the Apple IIGS works with 5.25-inch disks. They have "standard" Apple IIGS systems with 3.5-inch and 5.25-inch disk drives. The students use the 5.25-inch drives for their data disks and run the applications from the 3.5-inch drives.

They start up the Apple IIGS with a 3.5-inch disk, and they get the 3.5-inch disk icon and the 5.25-inch disk drive icon. If a student puts a 5.25-inch disk in the drive and double-clicks the drive icon, the system mounts the disk and shows the 5.25-inch disk icon. If the student double-clicks the disk icon before a disk is inserted, the Apple IIGS says that the disk is unreadable (there is no disk), and asks the user to "Eject" or "Continue". The students insert their disks, because they know the system can't eject something that's not there. Then, they click "Continue". The Apple IIGS then formats (erases) their data disks.

Can you change the dialog box that asks if you want to "Eject" or "Continue" to "Stop" or "Continue" (or something to that effect)? Can the drive detect that there is no disk inserted and give a different dialog box?

DISCUSSION -----

In GS/OS 5.0.2, you get two dialog boxes when an empty 5.25-inch drive icon is double-clicked. (This also occurs when the 5.25-inch drive contains a blank or unrecognizable disk.)

The first dialog is the one you describe with the "Eject" and "Continue" buttons. The second is a dialog asking to "Cancel" or "Initialize". This is where the user has the opportunity to stop the initialization process.

Because the first dialog is dismissed only with a mouse click, the possibility of pressing the Return key too many times is eliminated. However, the second

dialog defaults to the "Initialize" button; therefore, pressing the Return key causes the disk just inserted to be erased. However, if the "Cancel" button is clicked, the initialization process is terminated. Thus, there is a two-step process to invoke the initialization operation.

GS/OS: //WRITE and Network Printing

=====

This article last reviewed: 22 May 1990

TOPIC -----

I have now experimented with a variety of different settings and still can only be sure of getting AppleWorks to print to a LocalTalk ImageWriter. Another major problem I found was inserting a disk with software that GS/OS doesn't recognize (specifically, //WRITE from Random House Media).

I found a "solution" with some bugs. Here it is. I use the old AppleShare GS Workstation disk. Select CHOOSER.II from the menu, select the LocalTalk printer, escape from the menu, and choose the option that lets you provide a pathname to the software you want to use (in my case, //WRITE). This is where the problems arise.

- 1) On the new ROM Apple IIGS, the keyboard seems to be remapped so that the "/" key produces a "}". The only way to get the "/" is by using the one on the numeric keypad. On an older Apple IIGS, the keyboard is normal. Why?
- 2) A second problem arises after //WRITE is launched, and I've created a document and sent it to the printer. On the new ROM Apple IIGS, it goes to the printer, prints successfully, but the screen seems to go into 40-column mode. The machine still works, but you can't read the text (letters overlap). On the older Apple IIGS, everything works the same, but the screen remains normal. Why?
- 3) Can the menu that appears on the Workstation Disk be edited to place the name of the application in it and delete options I don't want users to play with (System Utilities, Server Log-on, and so on)?

DISCUSSION -----

- 1) The only way we were able to duplicate this result was to go to the Control Panel, select the Alphabet device, and set the Keyboard item to "Spanish". In other language selections, various other characters were displayed. Only

in the "Spanish" setting did the "}" character appear.

- 2) According to the people at Random House, they discontinued their software division about two years ago. We could not find anyone at Random House who knew anything about //WRITE, which is at least two years old. Without Random House assistance with this issue, we were unable to find a workaround to the 40-column problem.
- 3) The menu items are hard-coded into the menu application. There is no way to change the items in the list. Aristotle or Let's Share are the only network menu systems that can be modified.

## Macintosh: Making Multicolored Silk Screen Masters

Revised: 6/29/90  
Security: Everyone

Macintosh: Making Multicolored Silk Screen Masters

=====

This article last reviewed: 22 May 1990

TOPIC -----

Do you know of a way to use a Macintosh, scanner and a LaserWriter to make silicon film and, from this film, make multi-colored silk prints?

I read about something like this; I believe that the "system" was called PENTAGRAPH. The article also stated that "CAD is a newcomer to the silk print industry. ..."

Do you have any information on such a product?

DISCUSSION -----

The only process that appears to be similar to what you want is called "silk-screening". If this is what you are looking for, part of the solution is Macintosh-based, and part of it is based on traditional silk-screening techniques. Here is how silk-screening works:

Silk-screening is a photographic process. A light-sensitive emulsion is layered onto silk. This emulsion is exposed through an image on a film positive, much like creating an image on photographic print paper. Once exposed and processed with photographic-type chemicals, the silk lets ink to pass through unexposed areas and blocks the passage of the ink exposed areas. Any material placed under this processed silk screen receives the ink that passes through. This leaves an image on the material under the silk screen. This is the portion of the process that is based on traditional silk-screening methods. A graphics supply house should be able to provide all the tools and materials required for this phase of the operation.

The Macintosh can be used to create the film positive, which replaces the usual photographic film positive. Any software that prints to the LaserWriter can be used to create this image, including graphics and CAD software. Once the image is created, printing an image on transparencies

provides the equivalent of the film positive. You will, however, be limited to the size of transparencies that fit into the LaserWriter.

To create multiple colors, use one transparency for each color. This requires some type of color separation capability: either direct color separation in the application, or an application that provides several layers of images--one layer for each separate color.

## OmniPage: Incompatible with Macintosh Portable

Revised: 6/29/90  
Security: Everyone

OmniPage: Incompatible with Macintosh Portable

=====

This article last reviewed: 22 May 1990

TOPIC -----

I have a Macintosh Portable and want to know if OmniPage scanning software works on the system. It wasn't listed in the compatibility list in a recent Apple mailing.

Also, will a half-page or hand-held scanner work with the Macintosh Portable? Is there a list of scanners and scanner software that work with the Macintosh Portable?

DISCUSSION -----

OmniPage requires a 68020-based system with 4MB RAM to run. With these requirements, OmniPage will not work on the Macintosh Portable. We have yet to contact CTA, publishers of TextPert, but their package is listed as running on any Macintosh with a minimum of 1MB RAM.

We don't know of a list of compatible scanners and scanner software. However, Logitech (ScanMan) and Thunderware (LightningScan) indicate that their products work fine with the Macintosh Portable.

For more details, search the Technical Info library under "CTA."

## AppleShare Network: How to Check for ProDOS Files

Revised: 6/29/90  
Security: Everyone

AppleShare Network: How to Check for ProDOS Files

=====

This article last reviewed: 22 May 1990

TOPIC -----

I have Apple IIGS systems and Apple IIe systems on an AppleShare 2.0.1 network. When the Apple IIGS starts up, it shows ProDOS 1.8 and GS/OS, yet when the Apple IIe systems start up, they show ProDOS 1.4.

I have an application (MECC Communikeys) that apparently doesn't work correctly with ProDOS 1.4. (One Apple IIe works OK, but the other Apple IIe systems lock the entire network.)

Where is ProDOS 1.4 coming from? I've checked for P\* and P16 and even copied them from one folder to another.

DISCUSSION -----

When setting up an AppleShare File Server for an Apple IIe and Apple IIGS environment, two copies of P8 are installed. One copy is installed when the server is updated with the Apple II Setup Disk for the AppleShare File Server (a Macintosh disk). This copy is placed in the Server Folder. Another copy is installed when GS/OS is loaded from an Apple IIGS using the GS/OS SYSTEM.DISK and SYSTEM.TOOLS (Apple IIGS disks). This copy is at the root level of the server.

It appears that an early version of the Apple II Setup Disk was used on the server. Earlier versions of that disk contained earlier versions of P8. Reinstalling the Apple II setup should provide the current version of ProDOS. Use the Apple II Setup Disk marked:

"Version 2.1; For use with Apple IIGS System Software 5.0".

How did you check for the ProDOS files? Was the check done from an Apple IIGS? Was the check done from a Macintosh on the network? Was checking done on the server from within the Admin application? Was the server

restarted with a floppy disk and then checked for these files?

If the check was from a Apple IIGS workstation, the Server Folder is not visible. This is where one of the ProDOS files resides, and you would find only one of the ProDOS files.

If you checked from a Macintosh on the network, the result would be the same as when checking from an Apple IIGS workstation. There is no Server Folder available.

If checking was done on the server from within the Admin application, you will see the Server Folder, but you cannot open that folder and review its contents.

If the server was started up from a floppy disk and then the check was done, a second P8 file will be visible in the Server Folder.

## DAL and VAX: Async Connection Problem

Revised: 8/28/90  
Security: Everyone

DAL and VAX: Async Connection Problem

Article Created: 27 May 1990  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

I am evaluating Data Access Language (DAL, formerly known as "CL/1"). I set up an asynchronous connection (through a modem) to a VAX with Red Ryder with these settings:

1200 baud  
No parity  
8 data bits  
1 stop bits  
XON/XOFF

I connect to another VAX using DECnet with a "c MIS001". This is the VAX with the DAL server running. Leaving the terminal session open and using the DAL test application, I invoke this host connection script direct1200:

```
direct1200:async:com1:1200:Noparity:8databits:1stopbits:Bothxonxoff:128:Nomodem
```

This returns a "connection failed", error 10628(0) asynch() with no message.

I tried using the asyncl host:

```
asyncl:async:com1:1200:Noparity:8databits:1stopbits:BXonxoff:128:Modem:Tone::se  
cs:attempts
```

This returns a "Connection to host async failed", error 10643(0) asynch() with no message.

Then it returns a "connection failed", error 10628(0) asynch() with no message.

I think this is because of the round-about connection to the host, but it seems

if I already made the connection, the DAL tester should piggyback on the connection. I verified that the AppleTalk connection works and can access data this way. Therefore, it does not seem to be a server-based problem.

- 1) What script should I use for this type of connection?
- 2) How easy would it be to write a host script, so I don't have make the connection through Red Ryder?

DISCUSSION -----

We talked with Network Innovations, and they stated that their asynchronous protocols work only with VAX systems directly connected to the asynchronous link (in this case, the modem). In other words, they do not support logging on to one host, connecting to a second host via DECnet, and running the DAL server from that second host. They are aware of this issue and are looking at ways to resolve it in the future, but there is no workaround at the present time.

## HyperCard: Phone Stack and Apple 2400 Data Modem

Revised: 6/29/90  
Security: Everyone

HyperCard: Phone Stack and Apple 2400 Data Modem

=====

This article last reviewed: 22 May 1990

TOPIC -----

I cannot make my HyperCard Phone stack dial using an Apple 2400 Data Modem. This is the same stack that came with HyperCard with a few minor modifications. In the Phone stack, the outside access code is "\*06,". This command selects line six of our key phone system. The script behind any of the phone dial buttons dials, then waits 10 seconds, and dials again.

HyperCard selects line six and dials the appropriate number. I simply pick up the line on my handset in between these dials; the second dial is there just to get the modem to let go of the line once I pick up the handset.

I am using HyperCard 1.2.5 and the Phone stack is the one that came on that disk. This works fine with the Apple Personal Modem but will not work with the Apple 2400 Data Modem.

DISCUSSION -----

Make sure that the 10-second pause is in the "doDial" handler. Before "put empty", the last line of code in the handler, you should insert these lines:

```
-- wait 10 sec  
-- send return to HyperCard
```

This way the change takes place only once, and it's easier to follow the code at that point. The return causes the modem to drop the line, leaving the user in voice mode.

The problem with the modem and the Phone stack is that HyperCard opens the serial port for 3 seconds. It takes the modem (and many third-party devices) just under 2 seconds to go off hook. The dial string contains a comma creating a 1-second pause. This leaves a very small window in which to send the phone

number. Chances are the number is not completely transmitted, leaving you disconnected.

Our suggestion is to use the Serial XCMDs available from APDA to send data to the modem. This command set gives you complete control over the serial port, eliminating the need for the 10-second pause to get the modem to release. You will need to recreate the doDial handler to use the serial XCMDs.

## High-Speed Printer Solutions for the Macintosh

Revised: 6/29/90  
Security: Everyone

High-Speed Printer Solutions for the Macintosh

=====

This article last reviewed: 22 May 1990

TOPIC -----

A customer needs a high-speed printer setup for a Macintosh SE or Macintosh IICx to print labels in volume. The quality of print does not matter--Draft mode and readable is all that is needed. The ImageWriter II that is being used now takes 6 to 7 hours to print the current list, and this list will quadruple next month. Are there any dot-matrix connections to high-speed printers that truly take advantage of the printer's speed? Epson's package can only go as fast as the converter.

DISCUSSION -----

The majority of high-speed printers are line printers, not dot-matrix. Support Engineering uses a Printronix Model 300XG Line Printer with a Centronics parallel interface. The product used to connect it to the Macintosh is no longer available, but searching the "Buyer's Guide" on AppleLink with "parallel and serial and printer" as criteria, we found references to a number of products to connect high-speed parallel printers.

Among the products found were:

- Grappler C/Mac/GS from Orange Micro
- ParaLink from Jonathon Freeman Technologies, Inc.
- Macintosh Port Adaptor from Cambridge Automation, Inc.

## Macintosh Portable: Does Not Support SCSI Disk Mode (3/95)

Revised: 3/16/95  
Security: Everyone

Macintosh Portable: Does Not Support SCSI Disk Mode (3/95)

=====

Article Created: 27 May 1990  
Article Reviewed/Updated: 16 March 1995

TOPIC -----

Can I connect the Macintosh Portable to another Macintosh via the SCSI port?

DISCUSSION -----

No, the Macintosh Portable does not support SCSI Disk Mode as is supported on most PowerBook computers.

For many reasons, you should not connect two Macintosh computers via SCSI cables, with the exception of PowerBook computers which support SCSI Disk Mode. This includes all PowerBook models except for the PowerBook 140, 145, 145B, 150, and 170.

The most important reason is that you would then have two devices (the computers, and often the internal drive) on the bus with the same SCSI ID. Further, a straight-through cable would connect outputs to outputs and inputs to inputs, which would bring communications to a halt.

Article Change History:

## LocalTalk PC Card: How to Configure It for TOPS

Revised: 6/29/90  
Security: Everyone

LocalTalk PC Card: How to Configure It for TOPS

=====

This article last reviewed: 25 May 1990

TOPIC -----

TOPS documentation claims support for the LocalTalk PC Card. I want to communicate through the card from a PC using TOPS. Although TOPS claims support for the card, their technical support group could not tell us how the card must be configured. Can you help?

DISCUSSION -----

TOPS Technical Support told us how to configure their software for use with the LocalTalk PC Card. The most common problem encountered in this situation is that some required software is not included with the LocalTalk PC Card. AppleShare PC and the LocalTalk PC Card were originally shipped as a package. They are now separate items.

Users of the TOPS card should have an AUTOEXEC.BAT file that looks like this:

```
ALAP
PSTACK
TOPSTALK
TOPSKRNL
```

Users of the LocalTalk PC Card should have an AUTOEXEC.BAT file that looks like this:

```
LSL
LTALKP
ATALK
COMPAT
TOPSTALK
TOPSKRNL
```

Note that the first two files for the TOPS card user are replaced by the first

## ..TIL05573-LocalTalk\_PC\_Card-How\_to\_Configure\_It\_for\_TOPS\_(TA42667).pdf

four files shown for the LocalTalk PC Card user. The .COM files associated with the names above are included with AppleShare PC.

After starting up with the above AUTOEXEC.BAT file on disk, run TOPS menu and proceed as described in the TOPS documentation.

## Works-to-Works: File Transfer With AppleWorks 3.0

Revised: 6/29/90  
Security: Everyone

Works-to-Works: File Transfer With AppleWorks 3.0

=====

This article last reviewed: 22 May 1990

TOPIC -----

Around the time when AppleShare for Apple IIe was introduced, I had a discussion with someone from Productivity Software about the Works-to-Works AFE file. Now, I can't find them. Can you help?

DISCUSSION -----

The phone numbers we have for Productivity Software. However, they do still have an active AppleLink account (D0002). We tried to contact them by Link recently but did not receive a response.

CLARIS Tech Support is telling their customers to save the files as ASCII text for Works-to-Works to function as expected. As long as no new features are used, AppleWorks 3.0 saves files created in older versions of the software in their original format. Once a new feature is used, the creator type is changed and is no longer readable by older software. This is intentional and is meant to avoid "confusing" the old software when trying to deal with the results of a new feature.

Again, CLARIS suggests saving the file in ASCII form for reading into previous versions or converting to Macintosh format. For further clarification, contact CLARIS Technical Support. To get the number, see a CLARIS manual or search TIL under "CLARIS."

## AppleTalk Phase 2 and LocalTalk-Based Networks

Revised: 6/29/90  
Security: Everyone

AppleTalk Phase 2 and LocalTalk-Based Networks

=====

This article last reviewed: 22 May 1990

TOPIC -----

I would like to clear up what appears to be some confusion about the use of AppleTalk Phase 2 on a LocalTalk-based network. This is my understanding of the situation:

- 1) AppleTalk Phase 2 does not necessarily provide any benefit on a LocalTalk-based network and, in particular, does not enhance network performance. It may, however, be useful where the number of nodes on an Internet are expected to exceed 256 (because of address lengths).
- 2) It is better to use AppleTalk Phase 2 on a LocalTalk-based network when connecting to another AppleTalk Phase 2 network (removing the overhead of the AppleTalk Phase 2 Upgrade Utility). There are also some other benefits related to zone naming and removing some old limitations on Internets. To upgrade a LocalTalk-based network to AppleTalk Phase 2, all that is necessary is to copy the AppleTalk file that comes with AppleTalk Internet Router into the System Folder of any LocalTalk machines.
- 3) All networked machines should be upgraded to AppleTalk Phase 2 as it eventually will be included in ROMs, and additionally, Apple will stop shipping the AppleTalk Phase 2 Upgrade Utility with the router (from the MacLAN documentation).
- 4) Can you tell me where devices like LaserWriters fit in? On the AppleTalk Phase 2 Upgrade Utility, when you search for network devices, Macintosh systems with the AppleTalk file are identified as AppleTalk Phase 2. Other Macintosh systems are identified as AppleTalk Phase 1 (that is, on LocalTalk), and LaserWriters are identified as unknown devices. What does this mean?
- 5) Why does the router need the upgrade utility to route between AppleTalk Phase 1 and AppleTalk Phase 1? How is it used (that is, does it convert the

address to AppleTalk Phase 2 and back again)?

Will you confirm or correct my understanding of this issue. I am aware that opinions do differ somewhat within Apple, indicating that there is some confusion in this matter.

DISCUSSION -----

- 1) AppleTalk Phase 2 routers on LocalTalk-based networks do offer better performance than AppleTalk Phase 1 routers in the following situation:

Reduced broadcast traffic: One of the key reasons for customers to upgrade from AppleTalk Phase 1 to AppleTalk Phase 2 is the split horizon RTMP enhancement. Split horizon reduces the number of redundant routing table entries exchanged by routers. The split horizon algorithm is: All entries whose forwarding port in the routing table is equal to the port out that the entry is being sent are omitted from the RTMP Data packet. In other words, Router A will not include network numbers in RTMP packets broadcast on Network X when Network X is the path (forwarding port) for Router A to reach these other networks.

This information applies to LocalTalk-based networks connected via AppleTalk Internet Routers. Note that each AppleTalk Internet Router running the AppleTalk Phase 2 Upgrade Utility broadcasts AppleTalk Phase 1 and AppleTalk Phase 2 RTMP packets on LocalTalk-based networks. This means that an AppleTalk Internet Router running the AppleTalk Phase 2 Upgrade Utility actually increases broadcast traffic on LocalTalk-based networks networks connected to it.

AppleTalk Phase 2 does not provide any benefit to LocalTalk-based networks and Internets for node addressing. Node IDs are still 8 bits (0-255), and network numbers are still 16 bits (0-65,535).

- 2) The AppleTalk file you are referring to, when installed in the System Folder, causes version 53 of AppleTalk to be used in place of the ROM version of AppleTalk. Version 53 of the AppleTalk driver gives users on LocalTalk-based networks the ability to support some of the new high-level AppleTalk calls that do not in any way change the protocols used on the LocalTalk physical medium. These new high-level AppleTalk calls are documented in Macintosh Technical Note #250 (available on AppleLink under the Developer Services icon).

It is not necessary to use the AppleTalk Phase 2 Upgrade Utility on AppleTalk Internet Routers when no AppleTalk Phase 1 routers are on the Internet. This means that an all-LocalTalk Internet using only AppleTalk Internet Routers does not require the use of the AppleTalk Phase 2 Upgrade Utility. The LocalTalk nodes do not require the use of AppleTalk version 53 in this scenario.

LocalTalk-based networks, running AppleTalk version 53 or not, do not receive "other benefits related to zone naming and removing some old limitations on Internets" as you imply. LocalTalk networks have not changed in this respect with the advent of AppleTalk Phase 2.

- 3) Yes, all non-LocalTalk AppleTalk devices should eventually upgrade to AppleTalk Phase 2 compatibility. Yes, future Macintosh systems will ship with AppleTalk version 53 or later in ROM. Eventually, the AppleTalk Phase 2 Upgrade Utility will stop being shipped with the AppleTalk Internet Router. There is no timeframe for this.
- 4) AppleTalk devices that attach to a network via LocalTalk will continue to work on AppleTalk Phase 2 Internets as they do now on AppleTalk Phase 1 Internets. Remember, LocalTalk-based networks have the same limitations running under AppleTalk Phase 2 that they had under AppleTalk Phase 1. The AppleTalk "Phase 2 Node Identifier" utility that comes on the AppleTalk Phase 2 Upgrade Utility disk declares an AppleTalk node as AppleTalk Phase 2 if the AppleTalk version is 53 or greater and the AppleTalk type is "Macintosh xxx" where "xxx" is the type of Macintosh. If the AppleTalk version is less than 53 and the AppleTalk type is "Macintosh xxx", the node is identified as AppleTalk Phase 1. Nodes with an AppleTalk type other than "Macintosh xxx" are identified as unknown devices.
- 5) The AppleTalk Internet Router does not need the AppleTalk Phase 2 Upgrade Utility when routing between two LocalTalk-based networks. The AppleTalk Phase 2 Upgrade Utility allows the AppleTalk Internet Router to broadcast and receive AppleTalk Phase 1-style RTMP packets. This is all the AppleTalk Phase 2 Upgrade Utility does. The only time the AppleTalk Internet Router needs the AppleTalk Phase 2 Upgrade Utility is when there is an AppleTalk Phase 1 router on the same physical cable as the AppleTalk Internet Router.

An example of this:

Router A is an AppleTalk Internet Router

Router B is an AppleTalk Internet Router

Router C is a Kinetics FastPath 4 - AppleTalk Phase 1 only

Since Router C, the FastPath, is an AppleTalk Phase 1 router, the AppleTalk Internet Router (Router B) must run the AppleTalk Phase 2 Upgrade Utility. The AppleTalk Phase 2 Upgrade Utility causes Router B to generate and broadcast AppleTalk Phase 1-style RTMP packets onto Net 3. Router A does not need to use the AppleTalk Phase 2 Upgrade Utility because it is not on the same physical cable as the AppleTalk Phase 1 router (the FastPath). If Router C was replaced with an AppleTalk Internet Router and Net 3 was an EtherTalk 2.0 network, the AppleTalk Phase 2 Upgrade Utility would not be needed on any of the routers.

## A/UX: Data Structure of sa Manual Correction

Revised: 9/21/92  
Security: Everyone

A/UX: Data Structure of "sa" Manual Correction

=====

Article Created: 22 May 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

We've tried to use the records in the "sardd" files (directory /usr/adm/sa) to monitor some system resources and to get information about freemem, freeswap, and other dynamically changing parameters.

The customer found that the structure of the records written by "sadc" and the description of this structure in "sadc(1M)" did not match. I checked and found that the records written by "sadc" are 228 bytes on our system and the size of "sa" (System Accounting), as described, is 304 bytes.

Please send me the structure of the information contained in the records of /usr/adm/sa/sardd.

### DISCUSSION -----

We researched the data structure of "sa", and it seems that the one described in the "sadc(1M)" manual page is wrong; the "sa" data structure defined in the sa.h header file and used by the "sadc" program has the following structure:

```
struct sa {  
    struct sysinfo si; /* defined in /usr/include/sys/sysinfo.h */  
    int szinode; /* current size of inode table */  
    int szfile; /* current size of file table */  
    int sztext; /* current size of text table */  
    int szproc; /* current size of proc table */  
    int mszinode; /* maximum size of inode table */  
};
```

```
int      mszfile;      /* maximum size of file table */
int      msztext;      /* maximum size of text table */
int      mszproc;      /* maximum size of proc table */
long     inodeovf;     /* cumulative overflows of inode table since boot */
long     fileovf;      /* cumulative overflows of file table since boot */
long     textovf;      /* cumulative overflows of text table since boot */
long     procovf;      /* cumulative overflows of proc table since boot */
time_t   ts;           /* time stamp */
long     devio[NDEVSII4]; /* device unit information */

#define IO_OPS  0      /* number of I/O requests since boot */
#define IO_BCNT 1      /* number of blocks transferred since boot */
#define IO_ACT  2      /* cumulative time in ticks when drive is active */
#define IO_RESP 3 /*cumulative I/O response time in ticks since boot */
};
```

The total size of structure "sa" is 740. However, the record size of "sa" is computed as below:

```
recsz = sizeof (struct sa) - sizeof d.devio + recsz * sizeof d.devio[0];
```

The result of recsz from the above equation =  $740 - 512 + 0 = 228$

However, the first record of the data file will have the size of 232, which includes a 4-byte header at the beginning of the data file. The rest of the records have a record size of 228. If you monitor the size of data file, the size will have this order: 232, 460, 688, 916, 1144, and so on.

Concerning the record of the system accounting report file (/usr/adm/sa/sardd), the "sar" program generates different sizes of output files (from the input file "sadd" created with "sadc" program) depending on the options specified in the "sar" command line. By default, without any option, the "sar sadd-file" reports with the CPU utilization:

```
time-stamp   %user      %sys      %wio      %idle
```

If the -A option (all the options -uqbwcayvm) is used, it generates all supported information, like -b for reporting buffer activity, -y for reporting the tty device activity, and so on.

We reported the inconsistency of the "sa" data structure specified in "sadc(1M)" to A/UX Engineering.

## DAL: RMS, VAX Rdb, and VAX DBMS Support Q&A

Revised: 7/10/92  
Security: Everyone

DAL: RMS, VAX Rdb, and VAX DBMS Support Q&A

Article Created: 27 May 1990  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

I have some questions about Data Access Language (DAL, formerly known as "DAL") that I need help with:

- Is Rdb a relational database product that DEC ships free with VMS?  
Currently, DAL supports Rdb files (that is, you plug it in and play).
- Is RMS an older relational file structure supported by third-party products like DATATRIEVE. When will DAL support for RMS files be available?
- DATATRIEVE seems to be a query/script language for accessing RMS files. Does DATATRIEVE keep its own data files in RMS in such a way that DAL will be able to directly read them, or do we have to run some conversion process?

DISCUSSION -----

VAX Rdb/VMS is the DEC relational database management system. However, only Rdb Run-time is bundled with the VAX/VMS operating system. For Interactive and development use, users still have to purchase separate licenses from DEC. Please check with a Digital Sales Office for more information on this licensing.

VAX Record Management Services (VMS RMS) is not an older relational file structure, but rather it is the data management subsystem of the VMS operating system. In combination with the VMS operating system, RMS allows efficient and flexible storage, retrieval, and modification of data on disks, magnetic tapes, and other devices. Currently, RMS supports three file organizations: Sequential, Relative, and Indexed. It supports both Sequential Access and Random Access for Record Access modes. Currently, DAL does not support accessing RMS files directly.

VAX DATATRIEVE, a query and report system, provides a uniform access method for data stored by RMS, VAX Rdb, and VAX DBMS (a multi-user, general-purpose CODASYL-compliant network database management system). DATATRIEVE is also a Digital product, not a third-party product. Using DATATRIEVE, users can retrieve or modify data without considering the underlying storage method or physical location of the data. Because DATATRIEVE is only a query and report system, the storage of data is determined by the data management subsystem, like RMS, or a database management system, like VAX Rdb or VAX DBMS. If the data being used by DATATRIEVE is from VAX Rdb, DAL should be able to access it. Accessing RMS files directly is not possible with DAL as stated above. DAL will not be able to access data from VAX DBMS either.

## LaserWriter: How to Change the Manual Timeout

Revised: 6/29/90  
Security: Everyone

LaserWriter: How to Change the Manual Timeout

=====  
This article last reviewed: 23 May 1990

TOPIC -----

I want to change the manual-feed timeout on a LaserWriter IINT. I read the Tech Info Library article "LaserWriter Timeout Specifications", which states that this can be done and refers you to the "PostScript Language: Reference Manual". Because I'm no PostScript expert, I would like to get a PostScript program that changes the manual-feed timeout to 120 seconds.

DISCUSSION -----

Changing the timeout is done with the "setdefaulttimeouts" PostScript operator. This operator establishes the default values, job, manual feed, and wait for the three timeouts. At the beginning of each job, these values are used to initialize the job, manual feed, and wait timeouts. Each parameter must be a non-negative integer denoting the length of a timeout in seconds. The value of 0 indicates that the corresponding timeout should never occur. The default values for job, manual feed, and wait are 0, 60, and 30, respectively. A PostScript program, like the one that follows, can be sent to the printer to change timeout values:

```
serverdict begin 0 exitserver
statusdict begin
# # # setdefaulttimeouts
end
```

where # # # should be replaced by the job, manual-feed, and wait-timeout values in seconds. In your case, you want to change the manual-feed timeout to 120 seconds and keep the other values the same. Your third line should look like this:

```
0 120 30 setdefaulttimeouts
```

The PostScript program then can be downloaded to the printer using a download

utility, like Widgets, that comes with the CE Software DiskTop Utility. For more details, search the Technical Info library under "CE Software, Inc.."

## Macintosh and Distributed-Session Controllers (8/94)

Revised: 8/30/94  
Security: Everyone

Macintosh and Distributed-Session Controllers (8/94)

Article Created: 27 May 1990  
Article Reviewed/Updated: 26 July 1993

TOPIC -----

IBM has an SDLC card that distributes 3270 series sessions over IBM's implementation of Token Ring.

- 1) Is there software for the Macintosh that lets the Macintosh get a session from the SDLC card over Token Ring?
- 2) If yes, can the Macintosh be bridged to Ethernet or LocalTalk and get a session through that topology?

DISCUSSION -----

There is no software available at this time that lets a Macintosh connect to a distributed-session controller, like a PC with an SDLC card. Essentially, the ability to accept one of the distributed sessions from an SDLC interface requires software that is not yet available on Macintosh. Our only solution is the expensive route of using a true 3174 or compatible controller, or SNA Gateway product and terminal emulation.

You can also talk to Tri-Data, DCA (formerly Avatar), and Wall Data. All of these companies can address the needs of distributed 3270 sessions (Wall Data can also use the Serial NB Card). The Macintosh SE, Macintosh SE/30 and Macintosh II systems can use distributed SDLC sessions through an Apple Network System products, like Avatar MacMainFrame, Tri Data Netway 2000, Wall Data SNA•ps, or Andrew NetAccess. Note however, that these products do not provide a true solution, because there are no Apple or third- party products that use NetBIOS distributed SDLC sessions over Token Ring as implied by the request and are limited to a set number of sessions available for distributing.

Given the use of the third-party products listed here, it is also possible to acquire sessions across different network topologies through the use of routers, as in the case of an Apple Internet Router supporting LocalTalk installed with

an Ethernet card or Token Ring card.

Article Change History:

30 Aug 1994 - Updated with additional third-party offerings.

26 Jul 1993 - Company title changed from Avatar to DCA (Digital  
Communication Associates).

23 May 1990 - Updated for technical accuracy.

## Apple IIGS/Macintosh Versus PC-LAN Baseband Network

Revised: 6/29/90  
Security: Everyone

Apple IIGS/Macintosh Versus PC-LAN Baseband Network

=====

This article last reviewed: 23 May 1990

TOPIC -----

I just finished a competitive bid against IBM in a local school district. We were using AppleShare and Farallon PhoneNET cabling with existing in-plant wiring; IBM was bidding PC-LAN Baseband and Novell.

What can you tell me about PC-LAN Baseband, especially regarding its competitive position against Apple products?

DISCUSSION -----

IBM has two different networking schemes that are referred to as PC-LAN: Baseband and Broadband. They pitch Baseband for K-12 labs. Using the PC Network Adapter-II in the XT bus machines, like the original PC and PS/2-25/30, and the PC Network Adapter II/A for the MicroChannel machines, it is a 2Mbps CSMA/CD protocol run over unshielded, twisted-pair telephone wiring. The network uses the IEEE 802.2 LLC standard like AT&T StarLAN. A typical configuration is cabled in daisy-chain fashion using RJ-11 telephone jacks and telephone cabling with up to eight stations within a maximum 200-foot chain compared to a 4000-foot network limit with PhoneNET.

NetBIOS support is not provided directly on the card; it is via two software products, the PC Network Protocol Driver and the LAN Support Program. This network does not support 8022 LLC protocol or APPC/PC. This takes away from available, application memory. In addition, because Novell is the chosen server architecture, Windows is rumored to have difficulty--giving the Apple IIGS and Macintosh a further edge. As of March, 1990, IBM has not tried to demonstrate Windows on this configuration, lending support to this rumor.

The PC-LAN Baseband network can be enlarged using the IBM 5173 PC Network Baseband Extender, which has 10 ports. The network can be extended to 10 arms of eight workstations each, and the length of the daisy-chain arm is extended to 400 feet using the Extender. This means that the radius of a PC-LAN

Baseband network cannot exceed 400 feet, giving a significant advantage to LocalTalk and PhoneNET networks. The maximum network is 80 stations, unless a router is used to bridge multiple networks together or to jump to another topology, such as Ethernet or Token Ring.

Apple's advantage against IBM as being Apple's Strategic Network Direction--AppleTalk over twisted-pair with higher-speed backbones versus a network direction on IBM's part that was not strategic (Novell and PC-LAN Baseband as opposed to Token Ring and LAN Manager). Both the Macintosh and Apple IIGS to give a Finder interface and graphic applications have the Finder interface, whereas IBM can show only Microsoft Works as evidence of their graphics interface. Further, Apple has a strategic graphics interface and contrasted the offering from IBM, which was not robust enough to run a Windows environment. Finally, the 8086 technology is not strategic for IBM and that Windows and OS/2 are really geared for the 80286 and above technology. This leaves schools wondering about the long-term viability of PS/2-25s.

## LaserWriter IINTX: New ROMs Avalable May 1990

Revised: 6/29/90  
Security: Everyone

LaserWriter IINTX: New ROMs Avalable May 1990

=====

This article last reviewed: 11 June 1990

There is a new version of LaserWriter NTX ROMs being rolled into production in late May. These ROMs contain an updated version of PostScript. PostScript version 51.8 allows for the following enhancements.

- Full support of software switching between emulations and ports - It is now possible to both switch into and out of an emulation mode via software.
- Improved support of multiple SCSI disks - Up to 8 SCSI hard disk drives can now be connected to the LaserWriter NTX SCSI port. Up to 80% of the hard disk with the lowest SCSI ID is used for font caching with the remainder of that disk and all of any other connected hard disk used for downloaded fonts. Each hard disk is now formatted as a separate volume which allows a user move a disk (other than the startup disk) between systems without needing to re-format.
- Additional characters in the HP LaserJet+ emulation - Four characters have been added that had been left out of the original implementation of HP LaserJet+ emulation.
- Improved default settings for HP LaserJet+ bit map printing - Previously, bitmaps in HP LaserJet+ mode were interpreted at 7-bit thus ignoring a significant bit. The new ROMs default to 8-bit serial communications.

NOTE: These new ROMs are found in any LaserWriter NTX with a part number ending in 6004/A.

## Macintosh: Converting Vector Data to QuickDraw Data

Revised: 6/29/90  
Security: Everyone

Macintosh: Converting Vector Data to QuickDraw Data

=====

This article last reviewed: 7 June 1990

TOPIC -----

How many vectors is the Display Card 8/24 GC capable of handling?

I am interested in high-performance CAD. I assume that this number depends on whether or not the expansion kit is installed. Will you give me the data for both versions?

DISCUSSION -----

The Macintosh, like most desktop computer systems today, is a raster-based image system -- not a vector-based system. Vector data can be entered, but needs to be converted to a line drawing system based on cartesian coordinates for displaying on the screen. Specifically, for the Macintosh, this means that the vector data needs to be converted into QuickDraw data and then drawn with QuickDraw routines.

If you want to create your own CAD program, you need to understand both the vector system and the QuickDraw system, as well as do the conversion between the two methods. Your implementation of your vector system will determine the number of vectors handled.

On the other hand, if you want to use a commercial application, the vector limits are a specification of that commercial application. The application also converts the vector information into QuickDraw information for screen display. However, some commercial developers have bypassed QuickDraw and written directly to the Macintosh hardware. In these instances, the applications do not benefit from the accelerated QuickDraw of the new Display Card 8/24 GC. These applications also have a higher probability of breaking on newer models of the Macintosh.

The speed at which vectors are handled (as vectors) depends on the application's implementation and the speed of the CPU on which that application

is run. The faster the CPU, the faster the application. The speed of the conversion from vectors to QuickDraw is also application- and CPU speed-dependent. The speed with which QuickDraw is handled is a function of the Display Card 8/24 GC and the CPU speed.

Expanding the memory of the Display Card 8/24 GC allows a larger off-screen bitmapped image to be stored directly on the video card. This speeds up the movement of images larger than the screen as they move on to and off of the screen. The expanded memory acts a holding space for the off-screen bitmapped image.

## GS/OS: How To Identify Version Numbers

Revised: 4/10/92  
Security: Everyone

GS/OS: How To Identify Version Numbers

=====

Article Created: 7 June 1990  
Article Last Reviewed: 10 April 1992  
Article Last Updated: 10 April 1992

TOPIC -----

Could you tell me if there is an easy way to determine the version of GS/OS installed on different systems?

I looked in "About the Finder", and the Control Panel DA, and I did "Get Info" on several files the in System file, but none gave me the information I need.

DISCUSSION -----

To find the version of GS/OS and associated files installed on a particular disk, hold the space bar down during startup. This presents a text screen with the version numbers displayed.

The version number displayed at the top center of this screen correlates as follows:

| On-Screen<br>Version # | Date      | GS/OS Version (as Labeled on Disk) |
|------------------------|-----------|------------------------------------|
| -----                  | -----     | -----                              |
| 4.0                    | Aug 18 88 | GS/OS 4.0                          |
| 3.00 (or lower)        | May 30 89 | GS/OS 5.0                          |
| 3.02                   | Dec 15 89 | GS/OS 5.0.2                        |
| 3.03                   | Aug 20 90 | GS/OS 5.0.4                        |
| 4.01                   | Mar 04 92 | GS/OS 6.0                          |

- On-screen version numbers lower than 3.00 indicate GS/OS 4.0
- ProDOS 16 displays a startup screen with "PRODOS 16" on it
- System Disk 3.2 indicates ProDOS 16 v1.6

- System Disk 3.1 indicates ProDOS 16 v1.3.

## Macintosh: Serial Port Data Transmission Rate Limit

Revised: 1/7/92  
Security: Everyone

Macintosh: Serial Port Data Transmission Rate Limit

=====

Article Created: 7 June 1990  
Article Last Reviewed: 5 August 1992  
Article Last Updated: 5 August 1992

TOPIC -----

The SerReset function only lets me set the serial port speed to 57,600 baud. How can I set the serial port to support 203.4Kb?

DISCUSSION -----

The maximum nominal data transmission rate that you can select through the Macintosh Toolbox is 57,600 baud. This is the maximum rate that the Macintosh II computer can maintain for transmission of serial data, when the SCC port is operating in an asynchronous, interrupt-driven fashion, timed by the 3.672-MHz clock.

AppleTalk operates at a nominal data transmission rate of 230.4Kb. This higher rate is possible because AppleTalk communications are not interrupt-driven. During AppleTalk communications, the AppleTalk Driver has complete control of the computer. Although AppleTalk uses a synchronous communication protocol, the AppleTalk Driver runs the SCC chip in asynchronous mode, timed by the 3.672-MHz clock.

The maximum possible transmission rate for serial data ranges from approximately 500 Kbaud on the earlier Macintosh computers and the Macintosh Classic to 900 Kbaud on the modular Macintosh II family. To achieve such data transmission rates, the SCC would have to be operated in synchronous mode timed by an external clock, and the serial driver would have to have complete, uninterrupted control of the computer.

The transmit-data and receive-data lines of the Macintosh II serial interface conform to the EIA standard RS-422, which differs from the more commonly used RS-232-C standard in that, whereas an RS-232-C transmitter modulates a signal with respect to a common ground, an RS-422 transmitter

modulates the signal against an inverted copy of the same signal (to generate a differential signal).

The RS-232-C receiver senses whether the received signal is sufficiently negative with respect to ground to be a logical 1. The RS-422 receiver, on the other hand, senses which line is more negative than the other. An RS-422 signal is, therefore, more immune to noise and interference and degrades less over a distance than an RS-232-C signal.

If you ground the positive side of each RS-422 receiver and leave the positive side of each transmitter unconnected, you've converted to EIA standard RS-423. You can use this to communicate with most RS-232-C devices over distances up to approximately 50 feet.

## Applesoft BASIC: How To Launch From Aristotle

Revised: 6/29/90  
Security: Everyone

Applesoft BASIC: How To Launch From Aristotle

=====

This article last reviewed: 7 June 1990

TOPIC -----

I need to place an option in the Aristotle menu to run an Applesoft BASIC program.

I can get Applesoft BASIC up and running, but cannot seem to get a program to load. Is there any way to start an Applesoft BASIC program from Aristotle?

DISCUSSION -----

On the server, create a folder that contains the Applesoft program and BASIC.System. Rename the Applesoft program to STARTUP:

In the Aristotle Management program, add the program to the class list. The Title of the program can be any name that is appropriate -- it is used only for the Display menu. Set the path to:

```
{servername}/{foldername}/{any other foldernames}/BASIC.SYSTEM
```

Set the Prefix to the Applesoft program's pathname. BASIC.System looks for a program with the name STARTUP in the current folder (subdirectory). If BASIC.System finds the program, it launches it.

The next issue is how to get back to Aristotle. The BYE command will not return the user to Aristotle. Since BASIC.System was the launching program, the BYE command attempts to run BASIC.System. Some method is needed to launch Aristotle again. The following method requires some programming, but does provide a way to get back to the Aristotle menu.

This example assumes that the Aristotle folder is located at the server volume root level with a pathname:

```
{servername}/ARISTOTLE/MENU.D/DISPLAY
```

The example finds the servername and places where {servername} appears in the above pathname.

```
9900 D$=CHR$(4)
9910 PRINT D$;"PREFIX"
9920 INPUT PR$
9930 FOR I = 1 TO LEN(PR$)
9940   IF MID$(PR$, 1+I,1) = "/" THEN 9990
9950     RT$=RT$+MID$(PR$1+I,1)
9960 NEXT I
9990 PRINT D$;"-/" ;RT$;"/ARISTOTLE/MENU.D/DISPLAY"
```

The following is a discussion of what takes place in the above example.

```
9900 - Set D$ to Control-D.
9910 - Request the current PREFIX.
9920 - Put the current PREFIX into PR$.
9930 - Start loop to extract the servername from the PREFIX.
9940 - Skip the first character of PREFIX (/) and look for the second slash.
      When the second slash is found, jump to 9990
9950 - Put all the characters up to the second slash into the variable RT$.
9990 - Run the Aristotle menu display program.
```

This code can be used as a stand-alone program, or the lines can be added to the Applesoft program.

- If used as a stand-alone program, place it in the same folder as the Applesoft program. After quitting the Aristotle-launched Applesoft program, the student needs to type:

```
RUN {name of program}
```

- If added to the Applesoft program, these lines need to be the very last lines that are executed in the BASIC program. Remember, the line numbers need to be appropriate for the program to which they are added.

## HyperCard: Global/Local Variables

Revised: 6/29/90  
Security: Everyone

HyperCard: Global/Local Variables

=====

This article last reviewed: 7 June 1990

TOPIC -----

Is there a way within HyperCard to retrieve and/or set a local variable for handler "xyz" from handler "abc"?

I don't want to make everything a global variable and have them initialized as the stack is opened.

DISCUSSION -----

What you want to do is not possible. However, there are a number of ways to "fake" global-local variables.

You could create one global variable (in this example, "holdEm") containing many items.

For example:

```
put "1,5.67,fred,in,0,,rain" into holdEm
```

stores seven items in the variable named holdEm. To avoid a lot of messy initialization, the information in the variable could be saved in a field:

```
put holdEm into field storeVars
```

and restored to the variable when the stack opens:

```
put line 1 of field storeVars into holdEm
```

This is much faster than seven put statements.

## System Software 6.0.5: ADB Problems and Workarounds

Revised: 10/29/90  
Security: Everyone

System Software 6.0.5: ADB Problems and Workarounds

=====

This article last reviewed: 25 October 1990

TOPIC -----

This article contains information about compatibility problems between System Software 6.0.5 and some ADB devices.

DISCUSSION -----

Apple made some significant changes to the code handling ADB devices in System Software 6.0.5 (see Macintosh Technical Note 206, "Space Aliens Ate My Mouse"). Because of these changes, certain ADB peripherals don't operate properly.

So far, we've seen the following:

- A+ Optical Mouse: very jerky, inconsistent movement. According to someone on Usenet, Mouse Systems has acknowledged it as a hardware bug in the mouse that did not show up in System Software releases before System Software 6.0.5.
- The Abaton trackball causes the system to freeze, either during startup or later. It may work for a while, or it may just hang the system.
- The Kensington Turbo Mouse ADB also causes the system to freeze. Kensington has released an INIT that fixes this problem. Contact Kensington for a copy of this INIT.

AppleTalk Phase 2: Third-party Products as of June 1990

=====

This article last reviewed: 25 May 1990

TOPIC -----

I need to know the status of the following software companies' products and their commitment to supporting AppleTalk Phase 2:

Kinetics FastPath  
Cayman GatorBox  
Hayes InterBridge  
AlisaShare  
PacerShare  
Liaison  
Shiva Products  
AppleTalk for VMS  
TOPS

DISCUSSION -----

Here is the information we have as of March, 1990:

Kinetics FastPath: currently supports AppleTalk Phase 2; contact Kinetics for the latest information on their AppleTalk Phase 2 products.

Cayman GatorBox: currently supports AppleTalk Phase 2; contact Cayman for information.

Hayes InterBridge: currently supports AppleTalk Phase 2; contact Hayes for the latest information on their AppleTalk Phase 2 products.

AlisaShare: supports AppleTalk Phase 2 when used in conjunction with AppleTalk for VMS 2.1. For more information, contact Alisa Systems.

PacerShare: Pacer is working on supporting AppleTalk Phase 2 in a future release of PacerShare. For more information, contact Pacer.

Liaison: currently supports AppleTalk Phase 2. For more information, contact Infosphere.

Shiva Products: currently supports AppleTalk Phase 2; contact Shiva for the more information.

AppleTalk for VMS: AppleTalk for VMS 2.1 support AppleTalk Phase 2 and is available now.

TOPS: TOPS is working on supporting AppleTalk Phase 2 in a future release of TOPS. For more information, contact TOPS.

AppleShare PC: Checking Compatibility with the TELEX 386?

=====

This article last reviewed:

TOPIC -----

I want to install AppleShare PC on a TELEX 386, models 1285 and 7065.  
Will the LocalTalk PC Card work in these machines?

DISCUSSION -----

We aren't familiar with the TELEX 386 (nor do we have documentation on it), and we don't know of anyone who has used AppleShare PC with it. However, you might check these articles in the Tech Info Library.

- "LocalTalk PC Card and PC-Compatibles: Compatibility Issues"
- "LocalTalk PC Cards and AppleShare PC: Compatible Systems"
- "AppleShare PC 2.0: Compatible Network Cards"

They discuss many of the compatibility issues of using the LocalTalk PC Card with IBM PC-clones. After reading the articles, it should become clear to someone familiar with the TELEX whether the two might be compatible and whether it is worth their time to test that configuration.

## PostScript: How to Set Precision Bitmap Alignment

Revised: 6/29/90  
Security: Everyone

PostScript: How to Set Precision Bitmap Alignment

=====

This article last reviewed: 28 May 1990

TOPIC -----

If I create a rectangle in MacDraw and print two copies to a LaserWriter, one may measure 150mm x 200mm, and the other 151mm x 201mm. There is a variation in both dimensions. Sometimes, however, they may match perfectly. I am using the LaserWriter in a four-layer printing process and find this inconsistency very annoying.

Because the variation is in both dimensions and the age of the LaserWriter is relatively new, I believe the paper weight (which is within specification), the paper finish, and the age of the LaserWriter are unlikely to be possible causes of the problem. Can you help?

DISCUSSION -----

The size variance described is a result of PostScript interpretation of the bitmapped image. This results from attempts to change a 72-dpi image into a 300-dpi image. This is not an exact ratio. There may be as much as a 4-percent variance in PostScript's interpretation. PostScript's attempts at correction may vary slightly during each pass.

To compensate for this difference, choose Page Setup from the File menu. On the right side of the Page Setup dialog box, there is an Options button. Click this button, and an additional dialog box appears. The fourth checkbox is labeled Precision Bitmap Alignment (4-percent reduction). Be sure this checkbox is marked. Using this option increases the printing time. However, the printouts will be consistent during each pass.

## TokenTalk: Troubleshooting Problems

Revised: 10/5/93  
Security: Everyone

TokenTalk: Troubleshooting Problems

=====

Article Created: 28 May 1990  
Article Reviewed/Updated: 5 October 1993

TOPIC -----

I am having problems with system bombs under the following conditions:

The environment is a Token Ring network with DOS and OS/2 workstations and approximately 12 Macintoshes on the ring. I am using Excel with MacIrma and TokenTalk installed. When the system is not on the network, the Macintosh displays a system error. If the TokenTalk software is de-installed, the Macintosh works fine, and no system bombs occur.

Software

-----

System 6.0.3  
MultiFinder  
MacIrma 1.2.0  
Excel 2.2  
TokenTalk 2.0 (6/29/89)

Have you heard of any situations similar to this?

DISCUSSION -----

We contacted DCA Technical Support Group, and they have not heard of this problem. They also tried to duplicate the problem for us and could not get the system to fail.

The tests were done with both MacIrma 1.2.0 and 1.2.1, on both Macintosh IIcx and Macintosh IIX systems, and TokenTalk 2.0. Both machines passed the test with either version of MacIrma.

You might have a conflict between TokenTalk and something else other than MacIrma. You may want to start with a clean System Folder to see if the problem remains. If a clean folder solves the problem, start adding INITs

and see which one conflicts with TokenTalk.

## A/UX: Scheme Implementation

Revised: 11/10/92  
Security: Everyone

A/UX: Scheme Implementation

=====

Article Created: 17 June 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Do you know of any versions of scheme that might run under A/UX 2.0?

### DISCUSSION -----

There is a very good Scheme from MIT called C-Scheme. Look in  
goofy:~malcolm/bin/src/scheme.tar for the bits. There is probably a more  
recent version, and one of the README documents should tell you where to find  
it.

Also, Yale T has been ported to A/UX; it's available by anonymous FTP from  
ai.mit.edu, among other places.

## A/UX: lint Problem With Toolbox (9/94)

Revised: 9/21/94  
Security: Everyone

A/UX: "lint" Problem With Toolbox (9/94)

Article Created: 17 June 1990  
Article Reviewed/Updated: 21 September 1994

TOPIC -----

I am having problems using lint with toolbox programs. If I call lint to check programs that "include" header files from /usr/include/mac (for example, files.h), lint gives this message:

```
files.h(61):  
    **** cannot recover from this error  ****
```

You can reproduce the error by going to /usr/lib/mac/examples/term and giving the command:

```
$lint -I/usr/include/mac *.c
```

The problem is not the include file "files.h". If you take it out, the same error happens with other includes. Can you explain?

DISCUSSION -----

We have verified that the "\*\*\*\* cannot recover from this error \*\*\*\*" error message generated by "lint" (the C program checker) with toolbox "term" programs happen only on C programs that include the /usr/include/mac/files.h file or the "term.h" header file in the /usr/lib/mac/examples/term directory. The "lint" source reported a fatal error on the compiler and stopped the C code checking.

In later versions of A/UX, the source to "term" is no longer included in the product. Also, the "examples" directory is now in /mac/src.

## Display Card 8/24GC: Third-Party Monitor Support

Revised: 7/16/90  
Security: Everyone

Display Card 8/24GC: Third-Party Monitor Support

=====  
This article last reviewed: 29 May 1990

TOPIC -----

Will Apple's new video cards, specifically the Macintosh Display Card 8/24GC, support third-party monitors? I am particularly interested in RasterOps and SuperMac 19-inch monitors.

DISCUSSION -----

The Macintosh Display Card 8/24GC supports any display that meets one of the following specifications:

| Sense pins |   |   |                                 | Hor x Vert | Dot     | Vert   | Horiz  |
|------------|---|---|---------------------------------|------------|---------|--------|--------|
| 10         | 7 | 4 | Display                         | Pixels     | Clock   | Refrsh | Refrsh |
| -----      |   |   | -----                           | -----      | -----   | -----  | -----  |
| 0          | 0 | 1 | Apple Portrait Display          | 640 x 870  | 57.2832 | 75     | 68.9   |
| 0          | 1 | 1 | Apple Two-Page Monitor          | 1152 x 870 | 100     | 75     | 68.7   |
| 1          | 1 | 0 | 12" Apple<br>Monochrome Monitor | 640 x 480  | 30.24   | 66.7   | 35.0   |
| 1          | 1 | 0 | 13" AppleColor<br>RGB Monitor   | 640 x 480  | 30.24   | 66.7   | 35.0   |

0 - Grounded    1 - Not Connected

Note that sense pins 4, 7, and 10 are referred to as SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

None of the RasterOps or SuperMac 19-inch displays meets the above specifications. Based on this, we do not think that they will work properly.

Here are the pinouts for the Macintosh Display Card 8-24 GC:

| Pin | Description |
|-----|-------------|
| --- | -----       |

|       |                                         |
|-------|-----------------------------------------|
| 1     | Red Video Ground                        |
| 2     | Red Video                               |
| 3     | Composite Sync                          |
| 4     | SENSE0                                  |
| 5     | Green Video                             |
| 6     | Green Video Ground                      |
| 7     | SENSE1                                  |
| 8     | Not Connected                           |
| 9     | Blue Video                              |
| 10    | SENSE2                                  |
| 11    | Composite Sync and Vertical Sync Ground |
| 12    | Vertical Sync                           |
| 13    | Blue Video Ground                       |
| 14    | Horizontal Sync Ground                  |
| 15    | Horizontal Sync                         |
| Shell | Chassis Ground                          |

SuperMac has announced two new monitors that work with the new Apple video cards: the "Color Two-Page Display" and the "Platinum Two-Page Display."

## SMB File Transfer: Using With PC-LAN Server

Revised: 6/29/90  
Security: Everyone

SMB File Transfer: Using With PC-LAN Server

=====

This article last reviewed: 29 May 1990

TOPIC -----

I use the PC-LAN program "extended services" on our PC-LAN server. Can the SMB File Transfer program work with a server in that mode, which I prefer for the advanced services and security, or must directories be shared with Macintoshes via "base services"?

DISCUSSION -----

The SMB File Transfer program works with:

PC-LAN Base Version 1.2, and later (1.3, 1.31)  
PC-LAN Extended Version 1.3, 1.31  
OS/2 Extended Edition 1.1  
OS/2 LAN Server 1.1

SMB File Transfer lets you use the Extended Version's read/write/create options. Use the Netshare command to configure the PC:

```
NETSHARE shortname=d:\ password|* /r/w/rw/wc/rwc
```

## A/UX: Technical Questions & Answers (9/94)

Revised: 9/20/94  
Security: Everyone

A/UX: Technical Questions & Answers (9/94)

Article Created: 29 May 1990  
Article Reviewed/Updated: 20 September 1994

TOPIC -----

I need some additional information about A/UX support for X/Open XPG3 features like Message Queues msgctl(), Semaphores, shared memory, and so on. I need details in these areas:

- 1 - dbx (source level debugger).
- 2 - X.25 connection supported by "XTI" and libraries sockets. (What is "XTI"?)
- 3 - Support of s-bit for owner and group.
- 4 - System/library calls for disk "quota".
- 5 - Support for GF\_PATH, PF\_PATH, and IN\_PATH. (What are they in A/UX?)
- 6 - Are there public domain programs, like emacs, plot, and shar, available?
- 7 - What's the official name for the full screen standard editor in A/UX?
- 8 - Is printer spooling oriented on System V or BSD UNIX?
- 9 - Is there Multilevel security (DoD or Bell-La Padula with B-class certificate)?
- 10 - PHIGS and CGM under A/UX.
- 11 - Future support of System V version 4.
- 12 - What is the status of Oracle?

DISCUSSION -----

First, thanks to Richard Kefs (KEFS1), Apple Technical Partner Program Manager, for some of the answers that are included in this document. Here is the information you requested:

We should be fairly close to X/Open XPG3 compliance. The generic AT&T UNIX System V Inter-Process Communication facilities, which include Message Operations, Semaphores, and Shared Memory, are supported by A/UX.

- 1 - dbx is not supported. CDB, the popular, powerful, source level C debugger from Third Eye Software, was available for A/UX from APDA. It may no longer be available. We suggest contacting Third Eye Software for more information.
- 2 - We have several X.25 solutions under A/UX (Symicron, Mark Powell, (44) 1-857-55-77), but I do not know what "XTI" is.
- 3 - The set UID and GID bits are supported under A/UX.
- 4 - It seems that the disk quota control for each individual user account is not enforced in A/UX, but the BSD file system does maintain the "low-water mark" of about 5% of free file system. In other words, users may not allocate disk space if there is less than 5% of the BSD file system space remaining.
- 5 - We are unsure what the GF\_PATH, PF\_PATH, and IN\_PATH constants or environment variables referred to.
- 6 - emacs is available in the public domain.
- 7 - Both the UNIX ("vi") and the Macintosh ("Cut-and-Paste") style of editors are supported. The Macintosh cut-and-paste text editor is called "TextEditor". A/UX supports TEXT cut-and-paste between different environments (UNIX, X Window System, and Macintosh applications), and GRAPHICS cut-and-paste between Macintosh applications.
- 8 - Both System V and BSD UNIX printer spoolers are supported under A/UX 3.0.
- 9 - Regarding the secured A/UX system, AFSG (Apple Federal Systems Group) had an unreleased version of A/UX that complied with Federal Government requirements for a Class B1 level of trust on A/UX. This version was available to government customers only. You will need to contact a Federal Systems Group sales rep for further information.

According to NCSC (National Computer Security Center), the evaluation criteria define seven levels of trust called "Classes". In increasing order of trustedness, they are: D, C1, C2, B1, B2, B3, and A1. D systems are not trusted. A1 systems are extremely resistant to compromise. C1 has "Discretionary Access Control", such as AppleShare. C2 adds Security Auditing and Control Object Reuse. B1 adds Security

Labels and Mandatory Access Control. B2 adds Trusted Path, Convert Channel Control, and Modularity. B3 adds Trusted Recovery and Strict Isolation of Domains.

- 10 - If you are really looking for PHIGS and/or PEX (3D PHIGS/PHIGS+ Extension for X) type of features, a third-party called Prior Data Sciences in Canada may have the solution for A/UX.

Prior Data Sciences  
240 Michael Cowpland Drive

613-591-7235  
Telex: 053-3356  
Fax: 613-591-0343

- 11 - There are currently no plans to support System V.4.

- 12 - ORACLE7 Server for A/UX is available for use with A/UX.

## Display Card 8/24GC: Using with Sony Monitors

Revised: 7/16/90  
Security: Everyone

Display Card 8/24GC: Using with Sony Monitors

=====

This article last reviewed: 29 May 1990

TOPIC -----

I want to use the Sony MultiScan CPD-1304 monitor with the new Display Card 8/24GC. Will this work?

DISCUSSION -----

If the CPD-1304 monitor works with the Macintosh High-Resolution Video Card (the current 8-bit display card), there won't be any problem with the Display Card 8/24GC signals driving the Sony CPD-1304. (We could not verify that the CPD-1304 monitor works with the Macintosh High-Resolution Video Card, but we do know that Sony's CPD-1302 monitor works with that card.) However, you will need to use a different cable to connect the two devices because the cards have different connectors.

An issue with regard to the cable concerns the sense pins, which tell the card what type of monitor is attached. For the Sony CPD-1302 monitor, the sense pins should be configured as below, where 0 = Ground and 1 = Not Ground. To ground a sense pin, tie it to the C&VSYNC.GND signal.

| Sense pins |   |   | Display                | Hor x Vert | Dot   | Vert    |
|------------|---|---|------------------------|------------|-------|---------|
| 10         | 7 | 4 |                        | Pixels     | Clock | Refresh |
| -----      |   |   | -----                  | -----      | ----- | -----   |
| 1          | 1 | 0 | 12" Monochrome Monitor | 640 x 480  | 30.24 | 66.7    |
|            |   |   | 13" Color Monitor      |            |       |         |

Here are the pinouts for the Macintosh Display Card 8/24GC:

| Pin   | Signal  | Description      |
|-------|---------|------------------|
| ----- | -----   | -----            |
| 1     | RED.GND | Red Video Ground |
| 2     | RED.VID | Red Video        |
| 3     | CYSNC~  | Composite Sync   |

|       |             |                                          |
|-------|-------------|------------------------------------------|
| 4     | MON.ID1     | Monitor ID, Bit 1 (also known as SENSE0) |
| 5     | GRN.VID     | Green Video                              |
| 6     | GRN.GND     | Green Video Ground                       |
| 7     | MON.ID2     | Monitor ID, Bit 2 (also known as SENSE1) |
| 8     | nc          | (no connection)                          |
| 9     | BLU.VID     | Blue Video                               |
| 10    | MON.ID3     | Monitor ID, Bit 3 (also known as SENSE2) |
| 11    | C&VSYNC.GND | CSYNC & VSYNC Ground                     |
| 12    | VSYNC~      | Vertical Sync                            |
| 13    | BLU.GND     | Blue Video Ground                        |
| 14    | HSYNC.GND   | HSYNC Ground                             |
| 15    | HSYNC~      | Horizontal Sync                          |

## Amiga Graphics: Transferring them to the Macintosh (5/94)

Revised: 5/9/94  
Security: Everyone

Amiga Graphics: Transferring them to the Macintosh (5/94)

=====

Article Created: 30 May 1990  
Article Reviewed/Updated: 9 May 1994

TOPIC -----

A customer wants to transfer DigiPaint (HAM format) and Professional Draw (some type of encapsulated PostScript) files from an Amiga 2500 series computer to the Macintosh (I don't think they care what format). Do you have any suggestions?

DISCUSSION -----

There are a few possibilities that they can investigate. The first is the encapsulated PostScript route. If they can generate these files, there are a number of applications on the Macintosh that can read these files, including Illustrator, FreeHand, and a shareware product called Vision Lab. From these, you can generate PICT files. If they want to use bitmap graphics, DeBabelizer or Adobe PhotoShop on the Macintosh can translate HAM and Amiga IFF graphic files.

On the Amiga, you can use any of programs that store files in either GIF or JPEG. A few of these Utilities are V-Lab, Image-FX, and Art Department. You could then use an application on the Macintosh, such as the shareware programs Giffer, or JPEGView to generate PICT files.

Article Change History:  
9 May 1994 - Updated article to include new utilities on both the Amiga and Macintosh.

## Macintosh: Rocky Mountain BASIC Equivalent Needed

Revised: 6/29/90  
Security: Everyone

Macintosh: Rocky Mountain BASIC Equivalent Needed

=====

This article last reviewed: 30 May 1990

TOPIC -----

I use Rocky Mountain BASIC on an HP. Is there a similar package for the Macintosh?

DISCUSSION -----

The only implementation of BASIC for the Macintosh that is remotely similar to "Rocky Mountain BASIC" for the HP9000 series is Microsoft QuickBASIC. There are numerous differences, especially considering the machine-specific details of each BASIC. Rocky Mountain BASIC uses many commands and parameters that mean nothing to computers other than HP9000 systems. Likewise, Microsoft QuickBASIC uses Macintosh-specific commands that do not exist on other computers and a command syntax in traditional Microsoft BASIC style--a style much different than that of Hewlett-Packard's BASIC.

They do share the important ability to use subprograms and functions, but the method of implementing these is quite different between the two languages. Microsoft QuickBASIC would give you a powerful BASIC. However, porting anything other than the simplest programs from Rocky Mountain BASIC will not be a trivial task. This is especially with programs that are I/O-intensive, because these tend to be the areas where the languages differ the most.

There are some definite benefits to using Microsoft QuickBASIC over HP's BASIC, like advanced debugging features (breakpoints and animated tracing for source-level debugging) and a simpler mouse interface. Users can quickly grow accustomed to the Microsoft QuickBASIC product, while Rocky Mountain BASIC has a cruder interface and takes more time to master. Of course, you are already using Rocky Mountain BASIC, so the change in programming environment will have an impact to the degree that you are familiar with Macintosh user interface conventions.

If you need additional information on Microsoft QuickBASIC, we suggest that you

contact Microsoft directly. They should be able to provide more up-to-date information and could, perhaps, assist in deciding if their product will fit your requirements. For more details, search the Technical Info library under "Microsoft Corp AND WA"

We should mention that at least one company sells what is essentially a clone of Rocky Mountain BASIC for MS-DOS computers. These products provide a command set and environment that is very similar to HP's. Unfortunately, we do not know of any plans for similar products for the Macintosh. The closest would be to use one of these BASIC clones on an MS-DOS emulator, like SoftPC or Mac286--not a very elegant solution.

## Using Apple Display Cards With NTSC Monitors

Revised: 7/16/90  
Security: Everyone

Using Apple Display Cards With NTSC Monitors

=====

This article last reviewed: 30 May 1990

TOPIC -----

I want to use the Display Card 4/8 or 8/24 with an NTSC Monitor. Do you know of any Apple or third-party cables? Or do you have pinout information that will help?

DISCUSSION -----

The pinouts, sense-pin configuration, and data characteristics are listed below. After determining the pinouts of the monitor to which you plan to connect the video card, you can check the pinouts of Apple cables (posted on AppleLink) or third-party cables to see if one will work or if one must be made.

The Macintosh Display Card 8/24GC supports any display that meets one of the following specifications:

| Sense pins |   |   |                              | Hor x Vert | Dot     | Vert   | Horiz  |
|------------|---|---|------------------------------|------------|---------|--------|--------|
| 10         | 7 | 4 | Display                      | Pixels     | Clock   | Refrsh | Refrsh |
| -----      |   |   | -----                        | -----      | -----   | -----  | -----  |
| 0          | 0 | 1 | Apple Portrait Display       | 640 x 870  | 57.2832 | 75     | 68.9   |
| 0          | 1 | 1 | Apple Two-Page Monitor       | 1152 x 870 | 100     | 75     | 68.7   |
| 1          | 1 | 0 | 12" Apple Monochrome Monitor | 640 x 480  | 30.24   | 66.7   | 35.0   |
| 1          | 1 | 0 | 13" AppleColor RGB Monitor   | 640 x 480  | 30.24   | 66.7   | 35.0   |
| 1          | 0 | 0 | Interlaced Display           | -          | 12.2727 | -      | -      |

0 - Grounded    1 - Not Connected  
(Ground to pin 11, the Composite Sync and Vertical Sync Ground)

Note that sense pins 4, 7, and 10 are referred to as SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

None of the RasterOps or SuperMac 19-inch displays meets the above specifications. Based on this, we do not think that they will work properly.

Here are the pinouts for the Macintosh Display Card 8-24 GC:

| Pin   | Description                             |
|-------|-----------------------------------------|
| ---   | -----                                   |
| 1     | Red Video Ground                        |
| 2     | Red Video                               |
| 3     | Composite Sync                          |
| 4     | SENSE0                                  |

## AppleTalk Phase 2: Using LocalTalk-Based Networks

Revised: 6/29/90  
Security: Everyone

AppleTalk Phase 2: Using LocalTalk-Based Networks

=====

This article last reviewed: 30 May 1990

### Article Change History

-----

08/20/92 - REVIEWED  
• For accuracy.

### TOPIC -----

I am beginning to implement the DataKit technology from AT&T. The DataKit follows the AppleTalk Phase 2 router-to-router communications and is completely AppleTalk Phase 2-compatible. However, we have all PhoneNET networks running AppleTalk Phase 1 routers in the form of Hayes InterBridges.

These networks go through star controllers, and the DataKit will hang off one port of the controller. The DataKit is also an AppleTalk Phase 2 router, so it will be sending AppleTalk Phase 2 packets to the LocalTalk network.

Given this background, can you answer the following questions?

- 1) It was my understanding that LocalTalk-connected Macintosh systems could not take advantage of AppleTalk Phase 2 addressing. Why is this?
- 2) What about upgrading the Hayes InterBridges?
- 3) Does this mean that only the AppleTalk Phase 1 routers need to be upgraded to AppleTalk Phase 2 (like the Hayes InterBridge) and the rest of the nodes just become AppleTalk Phase 2 by installing AppleTalk version 53 in the System Folder?
- 4) Am I supposed to run the Internet Router in conjunction with the Upgrade Utility forever? (Do I have to use the Apple product? Does Kinetics or Hayes have an upgrade utility?) Can a LocalTalk network be

AppleTalk Phase 2 by upgrading AppleTalk to override the ROMs, even though it cannot take advantage of AppleTalk Phase 2 addressing? Does the account have to upgrade all of their existing AppleTalk Phase 1 products to AppleTalk Phase 2, even though they are using only LocalTalk (inherently AppleTalk Phase 1)?

DISCUSSION -----

- 1) The AppleTalk Phase 2 extended-addressing and multiple-zones-per-physical-network features were not implemented on LocalTalk because of the limited number (32 maximum recommended) of nodes that can be attached to one physical network. This is far less than the 254 nodes that AppleTalk Phase 1 supports. EtherTalk and TokenTalk can support many more than 254 nodes per physical network and, therefore, need the extended addressing and multiple zones capabilities that AppleTalk Phase 2 provides.
- 2) If the AT&T DataKit router is AppleTalk Phase 2 only and has nothing like our AppleTalk Phase 2 Upgrade Utility for dealing with AppleTalk Phase 1 routers, it will be necessary to upgrade the Hayes InterBridges to be AppleTalk Phase 2-compatible. Contact Hayes for information on this upgrade.
- 3) LocalTalk-based networks can be attached to AppleTalk Phase 2-compatible routers with LocalTalk ports without the AppleTalk version 53 file in the System Folder. In fact, this is the most common setup. The only time you need the AppleTalk version 53 file in the System Folder is when you need to support some of the new high-level AppleTalk calls that do not in any way change the protocols used on the LocalTalk physical medium. These new high-level AppleTalk calls are documented in Macintosh Technical Note #250 (available on AppleLink under the Developer Services icon).
- 4) The AppleTalk Internet Router does not need the AppleTalk Phase 2 Upgrade Utility when routing between two LocalTalk-based networks. The AppleTalk Phase 2 Upgrade Utility allows the AppleTalk Internet Router to broadcast and receive AppleTalk Phase 1-style RTMP packets. This is all the AppleTalk Phase 2 Upgrade Utility does. The only time the AppleTalk Internet Router needs the AppleTalk Phase 2 Upgrade Utility is when there is an AppleTalk Phase 1 router on the same physical cable as the AppleTalk Internet Router.

## EtherTalk 2.0: Networking Packet Formats and Protocols

Revised: 7/16/90  
Security: Everyone

EtherTalk 2.0: Networking Packet Formats and Protocols

=====

This article last reviewed: 30 May 1990

TOPIC -----

- 1) With AppleTalk Phase 2, how does the SNAP (SubNetwork Address Protocol) work?

If this works with the condition: DSAP=SSAP in LLC (Logical Link Control), the first 5 bytes of the LLC Information (LLC data) is the PID (Protocol Identifier). In this case, what are the DSAP and SSAP used?

- 2) Also, if the above is correct, what is the Apple OUI (Organizational Unique Identifier) in the PID header?

Notes

-----

IEEE 802.3 Frame

Preamble

|             |                 |
|-------------|-----------------|
| Dest-Addr   | (6 bytes)       |
| Source-Addr | (6 bytes)       |
| Length      | (2 bytes)       |
| LLC-DSAP    | (1 byte)        |
| LLC-SSAP    | (1 byte)        |
| LLC-control | (1 byte)        |
| LLC-data    | (43-1497 bytes) |

DISCUSSION -----

- 1) With EtherTalk 2.0, Apple is adopting standard networking packet formats as defined by the Institute of Electrical and Electronics Engineers (IEEE) 802 committee. The 802 committee defines standards for local area networking.

The IEEE divides the OSI data link layer into the Logical Link Control (LLC) layer and the Medium Access Control (MAC) layer. The IEEE LLC layer

provides error checking and reliable transfer of data. The LLC layer was defined to provide a uniform interface to the network layer, independent of the MAC and physical layers used. The LLC provides connectionless-oriented (Type 1) or connection-oriented (Type 2) services.

The MAC layer provides some of the lower-level functions of the OSI data link layer and some functions that fit into the OSI physical layer. These functions include channel (media) access, channel contention arbitration, and data formatting. The MAC layer has three variants:

- Carrier Sense Multiple Access/Collision Detect (CSMA/CD), which is similar to the Ethernet standard and is used in engineering and office automation applications.
- Token Bus, used in factory automation applications.
- Token Ring, which has been widely adopted by IBM and other companies for office automation applications.

Ethernet and 802.3 CSMA/CD are often incorrectly considered identical. Ethernet is a de facto local area network standard developed by Digital Equipment Corporation, Xerox, and Intel. It forms the basis for 802.3, but the 802.3 packet format is slightly different. Unlike the Ethernet packet, the 802.3 packet has no protocol-type field and has a data length field. Workstations using Ethernet packets do not recognize workstations using 802.3 packets, and vice versa.

The Ethernet protocol-type field is used to distinguish higher-level protocols. The protocol-type field allows for 64 different protocol identifiers. However, with the maturation of local area network technology, 64 different protocol identifiers are too few. To accommodate the large number of protocols, the IEEE developed the SubNetwork Address Protocol (SNAP) standard.

SNAP allows multiple protocols to be used with one data link. It defines a 5-byte field to identify the protocol using the data link. It ensures that protocol identifiers from different vendors do not conflict. The IEEE has assigned Apple a SNAP identifier for AppleTalk and AARP (Apple Address Resolution Protocol).

With EtherTalk 1.0, AppleTalk data was transmitted in the data field of an Ethernet packet. With EtherTalk 2.0, AppleTalk data is encapsulated in a SNAP packet, which is encapsulated in an LLC packet, and transmitted in a CSMA/CD 802.3 packet. The result is that EtherTalk 1.0 packets are not seen by EtherTalk 2.0 nodes, and EtherTalk 2.0 packets are not seen by EtherTalk 1.0 nodes.

Though EtherTalk 2.0 uses the SNAP interface, higher-level protocols can go directly to the LLC layer, and not use SNAP. SNAP allows connectionless communication services only. Software developers that need to use connection-oriented services must bypass SNAP and use the 802.2 LLC interface directly. Such developers would use Apple's Ethernet driver for our EtherTalk card, but would not use our higher-level EtherTalk 2.0

software.

EtherTalk 2.x (802.3) Frame

|                     |                                                    |
|---------------------|----------------------------------------------------|
| -----               |                                                    |
| 802.3 Destination   | 6 bytes                                            |
| 802.3 Source        | 6 bytes                                            |
| 802.2 LLC Length    | 2 bytes                                            |
| 802.2 LLC Header    |                                                    |
| 802.2 LLC DSAP      | 1 bytes (always \$AA (SNAP SAP) for EtherTalk 2.x) |
| 802.2 LLC SSAP      | 1 bytes (always \$AA (SNAP SAP) for EtherTalk 2.x) |
| 802.2 LLC Control   | 1 bytes (always \$03)                              |
| SNAP Header         | 5 bytes (always \$080007809B for EtherTalk 2.x)    |
| DDP Header          | 13 bytes                                           |
| AppleTalk Data      | ?? bytes (586 bytes maximum)                       |
| Padding (if needed) | ?? bytes                                           |
| -----               |                                                    |
|                     | 60 to 621 bytes                                    |

DSAP - Destination Service Access Point

SSAP - Source Service Access Point

The SNAP SAP is defined as \$AA.

If the 802.3 packet is less than 60 bytes padding is added to make the packet 60 bytes long.

In 802.2, DSAP and SSAP are almost always the same except in frames that are establishing an initial SNA connection.

- 2) The SNAP (SubNetwork Address Protocol) unique identifier assigned to Apple by the IEEE is \$0800070000. The first 3 bytes of the unique identifier is the vendor address. The last 2 bytes are the local administered (by Apple) identifiers. We (Apple) have defined \$809B as EtherTalk. The unique identifier for EtherTalk 2.0 is \$080007809B. This is considered to be a locally administered SNAP address.

A global SNAP address has been defined by the IEEE for AARP packets. The SNAP number is \$00000080F3.

These values are the same for TokenTalk 2.0.

## Macintosh IIci/IIfx: How to Install AppleShare

Revised: 6/29/90  
Security: Everyone

Macintosh IIci/IIfx: How to Install AppleShare

=====

This article last reviewed: 30 May 1990

TOPIC -----

I want to convert a Macintosh IIci and Macintosh IIfx into AppleShare File Servers. However, I cannot get the Installer to run on these Macintosh systems. Can you help?

DISCUSSION -----

The AppleShare File Server Installer disk will not start up on a Macintosh IIci or Macintosh IIfx. The AppleShare File Server Installer disk is a System Software 6.0 startup disk. The Macintosh IIci will start up only from a disk containing System Software 6.0.4 or later; the Macintosh IIfx will start up only from a disk containing System Software 6.0.5 or later.

You need to use the Network Products Installer disk that comes with System Software 6.0.4 and System Software 6.0.5 to install the AppleShare File Server software. The Network Products Installer has scripts to install the following network software:

- AppleShare Apple II Support
- AppleShare File Server
- AppleShare Print Server
- AppleTalk Internet Router
- EtherTalk
- SMB File Transfer
- TokenTalk

## LaserWriter: Recycled Paper Specifications (8/96)

Revised: 8/28/96  
Security: Everyone

LaserWriter: Recycled Paper Specifications (8/96)

Article Created: 30 May 1990  
Article Reviewed/Updated: 28 August 1996

TOPIC -----

With the use of recycled paper becoming more of an issue, has there been any testing done on its effects on the Canon LaserWriter engine? How is the paper graded, and what can we advise users to ask their suppliers for to ensure that the paper works with the LaserWriter?

DISCUSSION -----

There are a number of specialized tolerances associated with paper used in the LaserWriters. Although no specific tests have been done on recycled paper, the following specifications must be met for the paper, recycled or not, for paper to work properly:

Poundage tolerances = 16-35 lbs. with Manual Feed; 16-24 lbs. with Paper Tray.

Coating and grain are not specified individually, but the final smoothness, which includes the long-grain requirement and any coating, should fall into the range of 100-300 Sheffields.

The end result should be a paper, including any coating, that does not scorch or melt at 200 degrees C for 1/10 of a second.

## Serial NB Card: Multiple Serial Port Support (10/94)

Revised: 10/5/94  
Security: Everyone

Serial NB Card: Multiple Serial Port Support (10/94)

=====

Article Created: 30 May 1990  
Article Reviewed/Updated: 5 October 1994

TOPIC -----

I want to connect more than two serial devices at the same time. Can the Serial NB Card be used to add more serial ports?

DISCUSSION -----

It is true that the Serial NB Card theoretically gives you four additional serial ports. With the introduction of Apple Remote Access (ARA) MultiPort Server you can simultaneously use all four serial ports on a card.

However, there isn't any other software that uses more than one of these ports at a time. This includes MacX25, and SNA•ps, which cannot coexist on one card. You could continue using the two built-in serial ports with the one additional "external" serial NB port (in conjunction with MacX25 or SNA•ps software), so you could have a total of three serial ports available simultaneously.

Article Change History:  
05 Oct 1994 - Updated for clarity.  
10 May 1994 - Updated to include ARA MultiPort Server.

## Macintosh SE: How to Determine Different ROM Versions

Revised: 8/23/91  
Security: Everyone

Macintosh SE: How to Determine Different ROM Versions

=====

Article Created: 17 June 1990  
Article Last Reviewed: 23 August 1991  
Article Last Updated: 23 August 1991

TOPIC -----

When the Macintosh SE was introduced, I recall hearing something about the Macintosh SEs being shipped with different ROM versions. What are those differences, if any?

DISCUSSION -----

You are right; there have been two versions of ROMs shipped in the Macintosh SE. The only difference, which also makes the two systems easily distinguishable, is that the systems with Apple SuperDrives (formerly Apple FDHD) have newer ROMs that include support for that drive. Those with 800K drives have the original ROM.

Since the new code in the new ROMs is also used in the new systems, if any incompatibilities exist, they are likely to be related to the SuperDrive code and may very well affect the other Macintoshes with SuperDrives. We aren't aware of any software compatibility problems caused by these new ROMs.

## Virus Prevention: Install the System from Locked Media (4/94)

Revised: 4/1/94  
Security: Everyone

Virus Prevention: Install the System from Locked Media (4/94)

=====

Article Created: 17 June 1990  
Article Reviewed/Updated: 1 April 1994

TOPIC -----

This article describes the recommended approach when installing or upgrading software - use locked floppy disks, cartridge drives or CD-ROMs.

DISCUSSION -----

If you install system software or application software from an unlocked floppy disk or unlocked removable cartridge (often called a Syquest cartridge) which uses an Installer application onto a system infected with a virus, that unlocked disk can become infected.

From that point on, every system you use that Installer disk on becomes infected.

To prevent any viruses from spreading, you must know your master disks are clean, and you must use them only in a locked state. You can also use CD-ROMs, such as Apple's InstallMeFirst CD which are read-only disks and have been checked for viruses before production.

### Article Change History:

1 April 1994 - Added information on other locked media, as well as CD-ROM's  
25 August 1993 - Removed references to specific viruses and virus software that was outdated information.

## PICT2: Resource Fork Versus Data Fork Storage

Revised: 6/29/90  
Security: Everyone

PICT2: Resource Fork Versus Data Fork Storage

=====

This article last reviewed: 12 June 1990

TOPIC -----

I need some information on PICT2 data structure. I do digital photo-retouching frequently creates individual files 20MB to 30MB, or larger, especially when scanning at 4000 lines per inch.

I use film recorders, most of which are QuickDraw-based and accept PICT2 as input. I had a problem trying to create a 20MB PICT2 file from my scanning and retouching software (BarneyScan XP and PhotoShop). Is this a problem with the image software, or is it a PICT2 limitation?

We examined the PICT2 documentation in "Inside Macintosh, Volume 5." In PICT2, the picture length in the header is ignored (set to -1). Does this mean that this is variable data length?

DISCUSSION -----

The limitation that you are most likely running into is a resource size limitation rather than a PICT2 format limitation. If the application stores the pictures in the file's resource fork (as a PICT resource), it is understandable that you can't create a 20MB picture. The maximum size of a file's resource fork is 16MB. This is because a 3-byte number is used by the Resource Manager to offset into the resource map.

If your application can store the images in a format that uses the file's data fork, you should be able to create and use images larger than 16MB.

## LaserWriter II: Printing 3x5 Labels, a Workaround

Revised: 6/29/90  
Security: Everyone

LaserWriter II: Printing 3x5 Labels, a Workaround

=====

This article last reviewed: 12 June 1990

TOPIC -----

Do you have any kind of workaround for printing 3x5 labels on the LaserWriter II?

DISCUSSION -----

We constructed a "carrier" for small forms. It is a piece of heavy paper (about the same weight paper as 3x5 stock) cut to the size of a standard envelope. It has a hole cut in it to print through and a standard piece of paper glued to the back that adequately holds the small form in place. The small form slides into place, and then we feed the carrier manually.

We do not propose this as a solution for the problem. It is much too much trouble for large quantities. It does work very well when printing single labels or small forms. We can even print individual disk labels with this method. To make it even easier, we created a MacDraw II template that shows me exactly where the window on the carrier is. We used the template to create the carrier.

If this idea could be developed into a useful solution by some industrious person, we wouldn't mind if they used it.

## ImageWriter II: How Draft Mode Handles Fonts and Layout

Revised: 6/29/90  
Security: Everyone

ImageWriter II: How Draft Mode Handles Fonts and Layout

=====

This article last reviewed: 12 June 1990

TOPIC -----

Does the ImageWriter II have any built-in fonts? What font is used when the Draft option is selected? I printed in Draft mode from Microsoft Word 4.0, using both Palatino and Garamond, and the printouts were different. That is, the spacing between words was inconsistent.

Can you explain?

DISCUSSION -----

There are fonts built into the ImageWriter II ROMs. They are very simple character fonts with limited quality. Because these fonts are resident in the printer, they can print very quickly compared to the bitmaps sent to the ImageWriter for Faster or Best modes. With a Macintosh, the built-in fonts are used only when printing in Draft mode or when an application bypasses the Macintosh print driver.

Draft mode allows very fast printing of documents, giving a best-guess layout of characters and lines. Because this mode uses the built-in fonts, it cannot duplicate the spacing and effects visible on the Macintosh screen and is, therefore, not intended for anything other than rough drafts.

The best way to improve the print layout with Draft mode is to use a screen font that approximates the ImageWriter fonts used. The ImageWriter fonts are pica or elite in various sizes between 9 and 17 characters per inch. A list of the fonts used is on page 74 of the "ImageWriter II Owner's Manual."

Matching different screen fonts to printer fonts requires experimentation. Because Draft mode was not designed for optimal appearance, use it only for rough-draft output.

## Macintosh Portable Data Modem: Using with Dial-Back Systems

Revised: 6/29/90  
Security: Everyone

Macintosh Portable Data Modem: Using with Dial-Back Systems

=====

This article last reviewed: 12 June 1990

TOPIC -----

I want to use the Macintosh Portable with internal modem to dial into a corporate office network. We have a "dial-back" security system called Defender that requires the modem to answer the "callback" from the corporate network in "originate" mode.

Can this be done?

DISCUSSION -----

The Macintosh Portable Data Modem 2400 doesn't have an option for answering in originate mode, but it can be tricked into doing this. It won't be quite as convenient as setting up a single register, though, and you may want to use a script to automate it, depending on the communications program you are using.

Scenario

-----

Because the goal is to make the modem answer in originate mode, and the modem doesn't have this option, we're going to dial in originate mode, instead and just not dial a number. The trick is to set the modem options to disable Dial Tone detection. If this isn't done, the modem will wait for a dial tone when the other end is sending a carrier.

Follow these steps:

1) Set the modem's active response codes with: ATX3

(Enables OK, RING, NO CARRIER, ERROR, BUSY, and CONNECT messages, but disables dial tone detection which would prevent this from working.)

2) Dial the host and do the necessary steps to generate a callback.

3) Wait for Macintosh Portable modem to generate RING.

4) Immediately force the modem off-hook with: ATD

(The Macintosh Portable modem should wait for carrier and negotiate with the host's modem for a connection.)

5) When the CONNECT message appears, the modems will be talking.

This could easily be put into a communications program script, simplifying the process.

This article last reviewed: 9 August 1990

TOPIC -----

What Systems Application Architecture (SAA) standard does Apple write to? Can you help?

DISCUSSION -----

Systems Application Architecture (SAA) established a set of common standards and procedures for working with IBM systems and data. These include definitions for Common User Access, Common Communications Support, and Common Programming Interface. The following article from Networking and Communications summarizes how Apple complies with IBM's SAA:

Apple and SAA  
Networking and Communications Product Marketing  
March, 1990

A key element of Apple's networking strategy is Macintosh integration with IBM systems. The goal is to provide basic connectivity for the Macintosh, and then provide developers and customers with a set of protocols, interfaces, and tools that enable the development of consistent, integrated Macintosh applications for the IBM environments.

Apple will implement the IBM Systems Application Architecture technologies that complement the Macintosh, thereby enabling user transparent access to IBM data and services. Apple's product development will continue to focus on the core networking protocols, interfaces, and services that enable commercial developers and customers to create applications for end users. This helps to produce highly functional software in the shortest possible time by allowing developers to concentrate on the application and user interface, rather than networking.

Apple will continue to enhance the Apple-IBM product line through improvements

in functionality, performance, and usability. The commitment is to provide customers with a common Macintosh view of IBM data, services, and applications through support of Macintosh-complementary SAA technologies.

#### Common Communications Support

-----

Apple now offers a range of networking products that implement key SAA Common Communications Support (CCS) functions. The Apple TokenTalk NB, Serial NB, and Coax/Twinax Cards provide Macintosh connections to IBM SNA networks. MacDFT software provides 3270 terminal emulation with file transfer, as well as copy and paste, between the 3270 screens and Macintosh applications. MacDFT also supports the NetView alert reporting functions of SNA/MS. The Apple 3270 API serves as the 3270/SNA programming interface for MacDFT, Data Access Language (DAL, formerly known as "DAL"), MacWorkStation, and third-party applications. It is also available for the development of customized 3270 applications. MacAPPC implements the LU6.2/NT2.1 protocols, offering the basis for Macintosh integration with emerging cooperative processing applications. These products can be the basis for a wide range of applications, such as Macintosh interfaces to OfficeVision, DB2, and SQL/DS.

With the key connection and communication standards available, SAA application services, such as SNA/DS and DIA, are planned. Apple will also investigate implementations of SNA/MS, DDM, and SNA/FS as those technologies evolve.

#### Common Programming Interface

-----

The Common Programing Interface (CPI) element of SAA contains two technologies that complement the Macintosh: SQL for the Database interface and CPI-C for Communications.

DAL is Apple's host database access software and programming interface that provides the functionality of the CPI SQL interface. DAL provides consistent access to multiple database environments and multiple operating systems from Macintosh applications. Software developers will use the Apple System 7.0 Database Access Manager (DAM) to link their applications with DAL host servers for MVS or VM, providing access to DB2 and SQL/DS databases. This approach promotes network and database independence for Macintosh applications, and enables users to access data in IBM, Digital VAX, and UNIX environments from a single application.

The DAM also offers developers an interface for implementation-specific SQL dialects to complement DAL. Macintosh applications that access host data through DAL are enhanced by a range of query tools that allow users to perform ad hoc queries in intuitive, graphical ways. These third-party products take the form of Desk Accessories, HyperCard stacks, and applications.

As the customer requirement for LU6.2 products expands, CPI-C (the SAA interface to LU6.2) will be implemented as an enhancement to Apple APPC products.

Three other CPI technologies (Dialog, Query, and Presentation) specify functions that will not be directly supported by Apple because they are targeted at OS/2 and similar functionality is already integral to the

Macintosh.

#### Common User Access

-----

The Common User Access (CUA) element of SAA covers a wide range of guidelines, technologies, and products aimed at improving user interface consistency across IBM platforms. Apple does not plan to support the diverse elements of CUA since the Macintosh provides the best and the most consistent user interface to IBM systems as well as to multivendor environments.

Many organizations employ Digital VAX systems and UNIX platforms in addition to IBM. With the Macintosh, a "common user interface" that is integral to the Macintosh architecture for local and LAN-based applications is also supported on the VAX. In UNIX environments, Apple's A/UX 2.0 implementation of System V UNIX runs Macintosh applications and standard UNIX applications with full communications support based on industry standards, such as TCP/IP and NFS.

Unlike many vendors, whose personal computer, mainframe, and workstation user interfaces vary, Macintosh can provide a single-user interface, a mature application base, and rich data interchange capability across all of these systems. This advantage will be applied to SAA resources.

#### Common Applications

-----

The goal of Common Applications (CA) is to deliver functionality that spans several IBM platforms with a consistent user interface and portability. In addition to the advantages in a multivendor environment, Macintosh participates in Common Applications through support of SAA communications protocols and programming interfaces. Combined with the rich networking and toolbox facilities in the Macintosh environment, these SAA functions provide Macintosh users with a "common view" of the IBM host environments.

#### Summary

-----

Apple is committed to serving its customers by providing IBM SAA-compliant products that are integrated into the Macintosh environment. Apple has delivered the most critical networking and communications products for Macintosh interoperability in SAA environments and will continue to enhance our IBM networking and communications product line through support of accepted SAA standards that complement the Macintosh in an IBM environment.

## AppleTalk Address Resolution Protocol (AARP): Description

Revised: 6/29/90  
Security: Everyone

AppleTalk Address Resolution Protocol (AARP): Description

=====

This article last reviewed: 31 May 1990

TOPIC -----

Does AppleTalk Address Resolution Protocol (AARP) play a role in address resolution for MacTCP, or is there a corresponding TCP/IP protocol that manages this mapping? What can you tell me about products such as TSSnet?

I am trying to understand where AARP sits in a Macintosh running more than one protocol on a single datalink adaptor (for the sake of argument, consider it Ethernet). Are packets handed from the hardware adapter to ELAP to AARP to the appropriate protocol stack, or do they go from ELAP to the appropriate protocol stack, and then to AARP, only if the packet type is AppleTalk?

DISCUSSION -----

AppleTalk Address Resolution Protocol (AARP) is used to map between the AppleTalk node ID and the physical address of a datalink, such as Ethernet and Token Ring. For example, node A is a Macintosh on EtherTalk. This Macintosh has an AppleTalk node ID 30 and an Ethernet physical address \$02608C02AAA3. When an AppleTalk packet is sent to AppleTalk node 30, AARP is used to determine that the AppleTalk node 30 is at Ethernet physical address \$02608C02AAA3.

TCP/IP has a similar protocol call Address Resolution Protocol (ARP) that does basically the same thing, but in TCP/IP. For example, you have a machine with an IP address 130.43.4.13 and an Ethernet physical address \$02608C02AAA3. When a TCP/IP packet is sent to the IP address 130.43.4.13, ARP is used to determine that the IP address 130.43.4.13 is at Ethernet physical address \$02608C02AAA3.

Note: MacTCP, in native TCP mode (using Ethernet and no DDP/IP gateway), would not be generating AppleTalk packets; AARP would not be used, but ARP would be.

More information on AARP is in chapter 2 of "Inside AppleTalk."

Apple Tape Backup 40SC: Storage Specifications (8/94)

=====

Article Created: 31 May 1990  
Article Reviewed/Updated: 31 August 1994

TOPIC -----

Is there a way to use larger capacity tapes in the Apple Tape Backup 40SC unit?  
I want to use at least an 80MB tape.

NOTE: This product has been discontinued and is no longer available.

DISCUSSION -----

The Apple Tape Backup 40SC is physically capable of storing a maximum of 38.5MB of data per tape cartridge. There is no way to change this. Here are the specifications of data capacity for the Apple Tape Backup 40SC:

Total Capacity: 38.5MB  
Encoding Method: GCR (Group Code Recording)  
Flux Density: 12,500 ftpi  
Bit Density: 10,000 bpi (GCR)  
Block Size: 8192 bytes (8320 with 128 bytes of system data appended)  
Number of Tracks: 24 serpentine  
Track Width: 8 mils (.020 mm) write  
              5 mils (.0125 mm) read  
              10 mils (.025 mm) spacing

## Using ImageWriters Overseas

Revised: 6/29/90  
Security: Everyone

Using ImageWriters Overseas

=====

This article last reviewed: 31 May 1990

TOPIC -----

How do I adapt an ImageWriter I or II for European power 220V 50Hz?

DISCUSSION -----

The ImageWriter I printer requires a grounded, step-down, isolation transformer when used with a 220V power source. Using the ImageWriter I printers on a 50Hz source can noticeably affect spacing between characters.

There are already several articles in the Tech Info Library that discuss the ImageWriter II:

- "Part Available For Using ImageWriter II And ImageWriter LQ Overseas"
- "Electrical Specifications of Most Apple Hardware"
- "Using Apple Equipment Overseas"
- "Traveling with an Apple" contain more information.

Use the search criterion of "Overseas".

## Macintosh Portable: How To Disable Rest Mode (11/94)

Revised: 11/17/94  
Security: Everyone

Macintosh Portable: How To Disable Rest Mode (11/94)

=====

Article Created: 31 May 1990  
Article Reviewed/Updated: 17 November 1994

TOPIC -----

My Macintosh Portable cycles the clock speed down after a few minutes when running programs. What's going on?

DISCUSSION -----

The slowdown that you are experiencing is actually called Rest Mode.

The Power Manager processor monitors the amount of time the Macintosh Portable has been inactive. After a period of 15 seconds without any activity, the unit goes into Rest mode. It causes the CPU to insert 64 wait states into RAM and ROM accesses, which lowers the effective clock rate to approximately 1MHz. Interrupts continue to be processed at the same rate. As soon as the trackball or mouse moves, or any peripheral device is activated, the computer returns to full speed instantly.

The following items are checked and stop the unit from entering rest mode:

- Mouse movement
- I/O activity (keyboard, trackball, modem, and so on)
- Cursor change
- Serial port access

This feature can be turned off when running Video Works or some other program that avoids detection by the rest routine. You can disable rest mode by doing this:

- 1) Enter the Control Panel DA and select the Portable CDEV.
- 2) Hold Down the Option key and press on the words "Minutes Until Automatic Sleep".
- 3) Click "Don't Rest" in the dialog box that appears and select "OK".

## Motorola 6888x 680X0: Specifications

Revised: 6/29/90  
Security: Everyone

Motorola 6888x 680X0: Specifications

=====

This article last reviewed: 31 May 1990

TOPIC -----

I am writing specifications for a procurement and have questions about the Motorola 6888x and 680x0 chips used in the Macintosh SE/30 and Macintosh II family.

- 1) Is the external data path the same on the Motorola 68881 and 68882? Is it a 16- or 32-bit bus to the CPU?
- 2) Are the chip sets tightly matched (68020 to 68881 and 68030 to 68882), or can they be connected to other members of the 68000 family (that is, 68000 to 68881)?

DISCUSSION -----

- 1) The MC68881 and MC68882 use the same coprocessor interface (the M68000 Coprocessor Interface as defined by Motorola) and are pin-for-pin compatible with each other. The coprocessor interface can accept or provide transfers in 8 bits, 16 bits, or 32 bits; the bus is 32-bits wide.
- 2) The MC68020 and MC68030 have the M68000 Coprocessor Interface built in and can work in conjunction with any coprocessor that adheres to this interface. This means that these chips are not specifically matched to the MC68881 or MC68882. The MC68000, MC68008, MC68010, and MC68012 do not have the M68000 Coprocessor Interface built in. These chips still can be interfaced to M68000 coprocessors, like the MC68881, by providing instruction sequences that emulate the protocol of the M68000 Coprocessor Interface.

Motorola publishes user's manuals on all their microprocessors and coprocessors. For more information, search the Technical Info library under "Motorola."

## **SAM 2.0: Fix for MPW Linker Problem**

Revised: 6/29/90  
Security: Everyone

SAM 2.0: Fix for MPW Linker Problem

=====

This article last reviewed: 31 May 1990

TOPIC -----

SAM 2.0 has a problem with the MPW Linker. It refuses to learn about the MPW Linker adding CODE resources. What can I do?

DISCUSSION -----

Here is the fix for the MPW Linker problem:

- 1) Open SAM Intercept's resource fork with a HEX file editor (for example, FEdit).
- 2) Search for this hex string: "210370427ECFB8DE7E3A5C8F2874AE1B".
- 3) Change it to: "230370427A64DE3E18023C1F0C35E07E".
- 4) Save the changes.
- 5) Close the file.
- 6) Restart your Macintosh.

## Ethernet: Bridges and Routers

Revised: 6/29/90  
Security: Everyone

Ethernet: Bridges and Routers

=====

This article last reviewed: 1 June 1990

TOPIC -----

I need to have 20 Macintoshes on an Ethernet network but want to isolate them from the backbone. I like the Internet router, but need IP routing. Is there a bridging product that supports multiple protocols and does Ethernet-to-Ethernet bridging? Does DEC have such a product?

DISCUSSION -----

Bridges operate at the datalink layer level and are usually indifferent to network protocol. Routers operate at the network layer level and route only specific protocols.

DEC does have bridges that "routes" IP, as do Cisco, CableTron, Ungermann-Bass, Redix, NCS, ACC, and so on. Be aware, however, that some of the older bridges may not pass both 802.3 and Ethernet packets. If you want to isolate the network segment from the backbone, yet route IP and AppleTalk packets, Cisco is one example of the many companies that can provide this support (product descriptions are on AppleLink). They're among many developers of products sometimes called "brouters" or bridge-router hybrids.

## Linking Remote Sites Over 25-Pair Telco Wire

Revised: 7/23/92  
Security: Everyone

Linking Remote Sites Over 25-Pair Telco Wire

=====

Article Created: 1 June 1990  
Article Last Reviewed:  
Article Last Updated: 22 June 1992

### TOPIC -----

I want to link a remote site (approximately 3 miles) and has 25-pair Telco wire already laid from point to point. I know of the Shiva Telebridge and the Digital Access solution, but want to know if I have any alternatives.

### DISCUSSION -----

Line drivers, signal boosters, short-haul modems, CSUs, DSUs, and so on should all be available from your local telephone company or suppliers, such as BlackBox. The type you would use depends on the type of link you have (T1, 1MB, ISDN, DDS, and so on) and data rates you want to achieve.

Because you mention the Telebridge, it seems that you want to route AppleTalk packets over the link. Other products, like the Solana R-Server, the H-Server, and the Hayes InterBridge, can do this. Both the R-Server/S and the H-Server support data rates similar to that of the Telebridge.

Editor's Note 22 June 1992: Solana has discontinued business to our knowledge, so we are unable to refer you to them directly for further information.

## A/UX: How to Partition for Two 45MB Cartridges

Revised: 8/28/90  
Security: Everyone

A/UX: How to Partition for Two 45MB Cartridges

=====

This article last reviewed: 1 June 1990

TOPIC -----

In our office, we use 45MB removable cartridges as standards for hard disk storage. Some of us now want to use A/UX. Is it feasible to put A/UX on two separate 45MB cartridges and run it as is? If yes, what partitioning would you recommend?

DISCUSSION -----

If you have two 45MB cartridge drives on a Macintosh running A/UX, it may be possible to separate the standard A/UX Root&Usr partition into Root and Usr partitions on two different drives. Here is the list of disk partitions and their sizes from the standard A/UX 2.0b for an 80MB drive:

| Approx. size | Partition               |
|--------------|-------------------------|
| -----        | -----                   |
| 16K          | Macintosh Driver        |
| 16K          | Free                    |
| 54567K       | A/UX Root&Usr (slice 0) |
| 18432K       | A/UX Swap (slice 1)     |
| 3072K        | A/UX Autorecovery       |
| 2048K        | MacPartition            |
| 1K           | Free A/UX (slice 3)     |
| 1K           | Free                    |

For this particular situation, we would suggest that you put the "Macintosh Driver", the "A/UX Root"(/), the "A/UX Swap", and the "MacPartition" partitions on one drive, and put the "Usr"(/usr) partition on another drive. You may remove the "A/UX Autorecovery" partition if you have a way to recover from any disk disaster.

The total size of the "Macintosh Driver" (16K), the "A/UX Swap" (18432K), and the "MacPartition" (2048K) partitions is 20496K. Therefore, you can create the

## ..TIL05697-A-UX-How\_to\_Partition\_for\_Two\_45MB\_Cartridges\_(TA43555).pdf

"Root" ( / ) file system with the size of about 45MB - 20496K. Note that the current disk space occupied by the "Root" file system (excluding /usr) is about 20MB. Therefore, you have about 5MB of space for growing in the "root" drive. The entire disk size (in blocks) can be found from the report of "dp /dev/rdisk/cXd0s31" (X is the SCSI ID of the drive).

Use the "dp" command to create the above partition names and sizes in one drive. Within "dp", write down the size (in block) of the "Root" ( / ) file system for later "newfs" use.

On the other drive, you can allocate the entire 45MB for the "Usr" ( /usr ) partition. Use the same "dp" to create the "Usr" ( /usr ) partition, and write down its size. Note that the current disk space occupied by the "Usr" ( /usr ) is about 18MB. Therefore, you have about 25MB (maybe less due to 5 percent "low-water-mark" required on BSD UFS) space to grow.

To balance the disk space between the two drives, you can "symbolically" link some files or directories from the "Root" drive to the "Usr" drive.

To make a "Root" ( / ) Berkeley file system (UFS) do:

```
# newfs -s number-of-blocks-for-root /dev/dsk/cXd0s0
```

"X" is the SCSI ID of the 45MB "Root" drive.

To make a "Usr" ( /usr ) Berkeley file system (UFS) do:

```
# pname -cY -s2 "Usr"
==> /dev/dsk/cYd0s2
```

"Y" is the SCSI ID of the 45MB "Usr" drive, and assume "Usr" is the partition name created in the drive.

```
# newfs -s number-of-blocks-for-usr /dev/dsk/cYd0s2
```

After you have these file systems created, you can mount the above two file systems. Here is an example:

```
# mount /dev/dsk/cXd0d0 /45root
# mount /dev/dsk/cYd0s2 /45usr
```

After mounting the file systems, you can use either "cpio" or "tar" to copy the following files and directories (exclude /usr) onto the 45MB "Root" drive:

```
./[a-z]*
/[a-t]*
/[v-z]*
/[A-Z]*
```

and copy the following /usr directory onto the 45MB "Usr" drive:

```
/usr
```

## A/UX: Questions and Answers (11/95)

Revised: 11/29/95  
Security: Everyone

A/UX: Questions and Answers (11/95)

=====

Article Created: 1 June 1990  
Article Reviewed/Updated: 28 November 1995

TOPIC -----

This article contains frequently asked questions (FAQ) about A/UX?

DISCUSSION -----

Question: A/UX supports the Comm Toolbox. Can I drag tools from Mac OS and use them with A/UX, or must they be special versions?

Answer: If the tool uses a low-level communication protocol that A/UX supports (for example, serial, MacTCP), there is a good chance that the tool will work under A/UX. However, if the tool uses something unsupported, such as DECnet, it will not function properly under A/UX.

Question: MacTCP works on A/UX. Is it the same as on Macintosh OS, a special version, or a switch toward "native TCP/IP on A/UX"?

Answer: The MacTCP on A/UX is a special version of MacTCP for A/UX. The Macintosh OS version of MacTCP lets a non-Ethernet-based Macintosh run IP-based communications programs over LocalTalk by encapsulating IP packets into DDP packets. The A/UX version of MacTCP does not support this option.

Question: MacX works on A/UX. Is it the same as on Macintosh OS, and in this case, is the "MacTCP tool" in the Comm Toolbox the same as on Macintosh OS?

Answer: The MacX server under A/UX is identical to the MacX under Macintosh OS. So is the "MacTCP Tool" in the A/UX Extensions folder. If you intend to use a version other than that supplied with A/UX, refer to the MacX User's Guide for correct installation instructions.

## ..TIL05698-A-UX-Questions\_and\_Answers\_11-95\_(TA43561).pdf

Question: Does "X Window System native" work only in the Console Emulator session type, or does it work with other sessions types?

Answer: The "Native X11 Window System" can work only in the "Console Emulator" session type under A/UX.

Question: Why is UFS quicker than SVFS?

Answer: According to the original implementors of Berkeley Fast File System (UFS), the UFS provides up to ten times the file access rate of the traditional UNIX file system (SVFS). The performance enhancements include better locality of reference in the file system structures and support for large block sizes. In addition, the BSD UFS provides support for file-locking, symbolic links, "long" file names, 32-bit inodes, and resource quotas. In A/UX, however, A/UX UFS does not support resource quotas.

Question: What are the main improvements of X11R4 compared with X11R3?

Answer: In general, compared to X11R3, the code of X11R4 is smaller, and the performance of X11R4 is faster. It also provides a variety of bug fixes in X11R3.

Question: What is the Xaw Athena Widget Set?

Answer: The Xaw Athena Widget Set is a set of user interface components known as widgets, including scroll bars, menus, and buttons, and so on. The Xaw Athena Widget Set is included in the standard X11 distribution. In A/UX Native X Window System, the /usr/lib/libXaw.a library is the Xaw Anthena Widget Set.

Question: How does A/UX manage an A/UX Toolbox application, compared with the MultiFinder Toolbox, which is not "re-entrant"? Are all managed by the startmac process?

Answer: It is managed by the UI (User Interface) device driver and the MF (MultiFinder) under A/UX. Note that MultiFinder under A/UX follows the Macintosh paradigm for cooperative tasks and does NOT create a new or different one from the Macintosh.

Question: When an application uses the Toolbox, the calls are trapped (GetFile is changed in open or fopen, for instance). Is it the same for A/UX and Macintosh OS applications?

Answer: Yes, A/UX performs the same as it does under Macintosh OS. Toolbox applications share the same address space with Macintosh applications in that they have access to the application and system heaps, low-memory globals, and so on.

Question: Do communications cards, like Serial NB and others, work under A/UX?

Answer: It seems that the Apple Serial NB Card does not have a driver for A/UX yet. We would think both the AST-ICP card and the SuperMac Comm card should continue to work under A/UX.

Question: Is there an implementation of Open Look on A/UX?

Answer: Neither Tech.Comm nor A/UX Engineering knows of a port of AT&T Open Look for A/UX.

Question: Can MacX on A/UX manage several screens?

Answer: MacX server under A/UX supports only one screen (display). It does the same as under Macintosh OS.

## Macintosh-to-Amiga Amiga Graphics Transfer

Revised: 6/29/90  
Security: Everyone

Macintosh-to-Amiga Amiga Graphics Transfer

=====

This article last reviewed: 4 June 1990

TOPIC -----

I want to convert Amiga screens to the Macintosh. I don't write Macintosh programs, but I want to use the Macintosh with PageMaker to document Amiga the games.

DISCUSSION -----

GIF, an interchange format designed by CompuServe, is one of the most-used file formats for moving graphic images between different computer platforms. Various utilities are available in both the Macintosh and Amiga public domain arenas for converting standard graphic file formats to the GIF interchange format. Once in this format, just transfer the GIF files to the Macintosh.

On the Macintosh side, there is a utility called Giffer that reads a GIF file and writes a PICT file. The PICT file can then be placed in the PageMaker documents.

Altsys Metamorphosis: Utility to Retrieve Fonts

=====

This article last reviewed: 4 June 1990

TOPIC -----

How can I retrieve the font outlines from the LaserWriter hard disk and save them in Illustrator, Fontographer, and Type 3 font formats?

DISCUSSION -----

Try Metamorphosis from Altsys. It can retrieve the font outlines from the LaserWriter hard disk and save them in Illustrator, Fontographer, and Type 3 font formats. This will work well for all Type 3 fonts that have been loaded on the LaserWriters hard disk. However, as of April, 1990, any Type 1 Adobe fonts that are on the hard disk can be retrieved only as Type 3 fonts.

## Omnis 5.0: Solution for AppleTalk Printer Timeout Problem

Revised: 6/29/90  
Security: Everyone

Omnis 5.0: Solution for AppleTalk Printer Timeout Problem

=====

This article last reviewed: 4 June 1990

TOPIC -----

I have problems printing long reports (20+ pages) from Omnis 5.0 to an ImageWriter II with AppleTalk Option Card. The print job halts randomly with this error message "Connection with printer has been lost."

DISCUSSION -----

As of April, 1990, Omnis could not able to produce output quickly enough while generating a report to keep the printer from timing out. (This happens with both the AppleTalk ImageWriter and the LaserWriter.) This is similar to what we've seen with 4th Dimension.

The workaround is to have Omnis generate a page of output and then send the entire page to the printer. To do this, either put the report output into a list or spool it to disk. With a LaserWriter, you have an additional option of using background printing under MultiFinder. The page-at-a-time approach is what we've used with our 4th Dimension database.

Although we did not get into specifics, the Omnis people did not tie this problem to a problem with the AppleTalk ImageWriter driver. Instead, it seems to be a reality of printing reports that take a lot of processing when printing to any network-based printer.

System Folder: Securing With "Secure INIT"

=====

This article last reviewed: 4 June 1990

TOPIC -----

Do you know of any software that I can use to protect my System Folder configuration, so that users can't change it?

DISCUSSION -----

There is a Macintosh program called "Secure INIT" that records a fixed configuration of the System Folder. An option can be enabled that restores this fixed configuration on system Shutdown or Restart. It is also possible to make the System Folder invisible to the user.

## AppleTalk: Network Manager Status Program

Revised: 6/29/90  
Security: Everyone

AppleTalk: Network Manager Status Program

=====

This article last reviewed: 4 June 1990

TOPIC -----

Do you know of any product that updates software installed on local workstations through the network? This should act somewhat like Responder and Inter-Poll except that the workstation software can actually be updated. Also, the program should be able to do an analysis on each workstation and summarize the results in report form.

For example:

System 1: (ZONE: Finance)  
MS Word ver 3.01  
MacWrite ver 1.1  
Finder ver 6.0.5  
LaserWriter ver 6.0.1 ...etc..

System 2: (ZONE: Sales)  
MS Word ver 4.0b  
MacWrite ver 1.0  
Finder ver 3.2  
LaserWriter ver 4.1 ...etc..

.  
. .  
.

System n (ZONE: Engineering)  
MS Word ver 3.01  
MacWrite ver 1.1  
Finder ver 6.0.5  
LaserWriter ver 6.0.1 ...etc..

Summary:

|   |          |           |
|---|----------|-----------|
| 2 | MS Word  | ver 3.01  |
| 1 | MS Word  | ver 4.0b  |
| 2 | MacWrite | ver 1.1   |
| 2 | Finder   | ver 6.0.5 |

DISCUSSION -----

We don't know of a package that does updates, but there is a package to be released in July, 1990 from Pharos called System Status Mac. It acts like Inter-Poll and investigates workstations on the network, responding with the version numbers of software. The System Manager can then compile the results and advise users when upgrades are available.

## 800K INIT: Use with System 6.0.3 or Earlier

Revised: 4/18/91  
Security: Everyone

800K INIT: Use with System 6.0.3 or Earlier

=====

This article last reviewed: 4 June 1990

TOPIC -----

Was the 800K INIT fix included as part of System 6.0.3 (and later) software? Is it part of the System file? I can't find an INIT file called 800K INIT.

DISCUSSION -----

You do not need to use the 800K INIT with System Software 6.0.4 or later because its equivalent is built in--it's actually part of the System file. However, you do need to install it on Macintosh computers with 800K drives when using System Software 6.0.3 or earlier.

## Apple Tape Backup 40SC: Third-Party Backup Speeds

Revised: 6/29/90  
Security: Everyone

Apple Tape Backup 40SC: Third-Party Backup Speeds

=====

This article last reviewed: 4 June 1990

TOPIC -----

Using Apple Tape Backup 40SC 2.0.1, what is the average access time for the drive if a user has it mounted on the desktop?

DISCUSSION -----

By "average access time", we assume that you mean the average transfer rate. Measuring the average access time for a tape drive would make little sense, since it's not a random access device. If one were to test this, it could take a very, very long time.

Apple does not publish any official numbers for this specification, but we were able to achieve .95MB per minute using Tape Backup 40SC version 2.0.1. This rating was calculated without the time required to rewind the tape at the beginning and end of the backup. Only the speed of writing to tape for a 20MB volume backup was used.

Backing up files is considerably slower and varies depending on the sizes and numbers of files. Third-party backup programs that are compatible with our tape drive are faster in file-by-file mode than Tape Backup 40SC 2.0.1.

Tape Backup 40SC cannot be mounted on the desktop. The Tape Disk INIT was designed solely for single-file recovery from backups created with the volume backup option. It was not created to provide another backup option, and will not perform this function, unless a volume backup already exists for it to work with. This is documented in the "Apple Tape Backup 40SC Owner's Guide."

SuperMac Technologies has released their equivalent of Tape Disk named TapeDriver. It appears to work with the Apple Tape Backup 40SC to allow mounting the tape on the desktop, even if the tape doesn't contain a volume backup. It is not compatible with Tape Backup 40SC 2.0.1 volume backups, though, and asks to erase any tape inserted that contains one. The INIT is

available on AppleLink by following this path:

3rd Party Connection

Third Party Software Updates

SuperMac

Mass Storage Support Files

TapeDriver

The two programs that we tested and found to be compatible with the Apple Tape Backup 40SC are Retrospect (Dantz Development Corp) and FastBack II (Fifth Generation Systems, Inc). Contact their vendors for more information. For more details, search the Tech Info library under company names for details.

## Datapen Bar-Code Reader

Revised: 6/29/90  
Security: Everyone

Datapen Bar-Code Reader

=====

This article last reviewed: 4 June 1990

TOPIC -----

I need a lightpen to read bar-code data that will be stored in a 4th Dimension or Foxbase database. Do you know anything about?

DISCUSSION -----

Datapen is a computer-keyboard interface device used for decoding and entering data via bar codes. Bar-coding can be incorporated into any type of computer terminal or point-of-sale system. There is no need to change the system software, because Datapen emulates the existing keyboard and is completely transparent to the programs in use.

You don't need a decoder, since Datapen itself is a decoder device. The system thinks all the data is entered from the keyboard. To the existing programs, Datapen is invisible.

Contact pen readers, laser scanners, badge readers, CCD scanners, and most other types of intelligent, RS-232, input devices work with Datapen. Datapen supports the following bar-code readers/scanners:

- All Datalogic standard readers
- Pens P10, P31, P32, P40
- Laser hand-held scanner LS8110, DL4100, and DL4200
- CCD hand-held scanner DL60 series
- Slot reader SR11

Datapen supports UPC/EAN, 2/5/5 bars, Code 39, Codabar, 2/5 Interleaved, 2/5, ABC Codabar, MSI, Plessy, Code 32, Code 11, UPC A/E Add on code, 2/5 Datalogic, EAN/LAC, 2/5 Industrial, Delta IBM, Code C.I.P., Code 93, and Code 128.

Datapen installs between the computer and the keyboard. The keyboard cable from the Macintosh is plugged into Datapen, and the Datapen cable is plugged

into the computer keyboard.

## Converting Various Graphic Files to Macintosh PICT Files

Revised: 9/27/91  
Security: Everyone

Converting Various Graphic Files to Macintosh PICT Files

=====  
Article Created: 4 June 1990  
Article Last Reviewed: 27 September 1991  
Article Last Updated: 27 September 1991

TOPIC -----

I want to transfer DigiPaint (HAM format) and Professional Paint (some type of encapsulated PostScript) files from an Amiga 2500 series computer to the Macintosh. (I don't think they care about the format.) Do you have any suggestions?

DISCUSSION -----

"PICTure This" from FGM Software is an application and DA that converts a wide variety of graphic file formats to PICT and PICT2 formats. Professional Paint should also provide the Amiga IFF format. FGM has indicated that Amiga EPSF files are different than Macintosh EPSF files, and they do not support the Amiga format at this time.

File Formats

-----  
Targa 8, 16, 24, 32  
CGM  
PCX (all varieties)  
TIFF (all varieties)  
LetraSet RIFF  
Amiga IFF (except the 24 bit)  
Amiga HAM  
RIFF  
X11 Bitmaps  
Dr. Halo Cut (with palette support)  
SunRaster Images (B&W and 8 bit)  
CompuServe GIF  
CompuServe RLE  
GEM IMG (PC and Atari)

Lotus PIC

Lotus BIT

Lotus RLE

MacPaint

Macintosh EPSF (due to variations, most other platforms are not supported)

For more details, search the Tech Info library under "FGM Inc."

## AFP Passwords and User Authentication Methods

Revised: 6/29/90  
Security: Everyone

AFP Passwords and User Authentication Methods

=====

This article last reviewed: 7 June 1990

TOPIC -----

Are AppleShare File Server user passwords stored in the Users and Groups file in an encrypted or unencrypted form? If encrypted, what is the algorithm? If encrypted, is the encryption key stored on the server volume?

It is my understanding that in the Random Number Exchange method for user authentication, user passwords are never transmitted over the network unencrypted. Is this correct?

DISCUSSION -----

It is true that passwords are not encrypted in the Users and Groups file on the server. The theory is that the file is not accessible over the network and that a server requiring security can be locked away from prying eyes and software.

You are correct in stating that the Random Number Exchange method of user authentication does not send a password over the network unencrypted. Be aware that some third-party AFP servers may not support this method (although it would be unusual), and the user has no control over what user authentication method is used. The server being connected determines this. For a more detailed description of user authentication methods available through the AppleTalk Filing Protocol, read "Inside AppleTalk" pages 13-28 through 13-30.

Macintosh: Application Launch Time Depends on Amount of RAM

=====

Article Created: 7 June 1990  
Article Last Reviewed: 8 June 1992  
Article Last Updated:

TOPIC -----

When launching FileMaker II (Macintosh IIci, Internal HD80 SC, 8MB RAM) under the Finder, it takes twice as long as under MultiFinder. I've tried it with and without the video card and had the same results. I've also tried it with a Macintosh IICx, and it took approximately the same time to launch under Finder and MultiFinder. Can you explain?

DISCUSSION -----

We were able to reproduce these results on a number of systems, and it seems to be based on the amount of memory available to the application. Launching FileMaker II in a 6MB MultiFinder partition takes significantly longer than in a 2MB space. When the application launches, it checks the space available to it, and prepares it for its own use. It is also possible that more resources are preloaded into available memory. We found the same to happen with a number of applications, including Microsoft Word.

You didn't mention how much RAM was in the Macintosh IICx that you tried, but we suspect that it has 2MB or less. This would explain why the launch time under Finder was close to that under MultiFinder. Launching FileMaker II under Finder on an 8MB Macintosh IIX took 50% longer than on the same system in a 512K MultiFinder partition.

## Apple HD SC Setup 2.0.1: Partition Size

Revised: 6/29/90  
Security: Everyone

Apple HD SC Setup 2.0.1: Partition Size

=====

This article last reviewed: 7 June 1990

TOPIC -----

I just used the new Apple HD SC Setup 2.0.1, part of System Software 6.0.5, to reformat the internal HD80 SC drives on my Macintosh IIci and my Macintosh II. I was surprised to find that this reduced the disk capacity by roughly 1MB. I did a backup using DiskFit before reformatting. After reformatting, there wasn't enough room to restore. After deleting some non-essential files to make everything fit, I have "74,753K in disk and 1,539K available". Where did the space go?

DISCUSSION -----

If a Quantum PRO drive was originally initialized with Apple HD SC Setup 2.0, the HFS partition would be larger than if it was initialized with Apple HD SC Setup 2.0.1. The reason is that the PRO drives were not directly supported by Apple HD SC Setup 2.0 (the drive did not exist yet!). However, because it was an Apple drive, the Apple HD SC Setup 2.0 software supported the drive with generic, Apple-drive settings. The size of the HFS partition was rounded down to the closest 20MB. Therefore, under Apple HD SC Setup 2.0, the HFS partition was 160,000 blocks (even).

Apple HD SC Setup 2.0.1 included changes that added direct support for PRO drives and the Macintosh IIci. (See the "System 6.0.5 Final Change History" for details.) The default HFS partition size for each drive is in an internal lookup table. The number of blocks allocated on a standard, known 80MB drive is 156,270 blocks. This size has been dictated by the original Quantum Q280 5.25-inch drive that had only 156370 blocks. To make ALL 80MB drives look alike (at least on the surface), we standardize on one 80MB partition size.

Therefore, if you had a PRO 80s drive, and you initialized it with Apple HD SC Setup 2.0 software and then went to Apple HD SC Setup 2.0.1 software, you would have lost 3730 blocks of storage or about 1.5MB. A workaround would be to use the CUSTOM partition screen, remove the original HFS partition, and create a

new one manually, which is 80,000K.

## A/UX: System 5 Interface Definition (SVID) Compliance (9/94)

Revised: 9/20/94  
Security: Everyone

A/UX: System 5 Interface Definition (SVID) Compliance (9/94)

Article Created: 7 June 1990  
Article Reviewed/Updated: 20 September 1994

TOPIC -----

I want to know what our level of SVID compliance is. Can you help?

DISCUSSION -----

This is the response from A/UX Engineering Management regarding the A/UX SVID compliance:

SVID - System Five Interface Definition is a two-volume book that describes the user and program interface to AT&T System V UNIX. It is published by AT&T and available for a nominal charge. SVVS, System Five Verification Suite, is a lengthy test program from AT&T that one MUST pass, WITHOUT modifications to claim SVID compliance.

A/UX passes SVVS V.2 and always has. The V.2 designation means that it is the verification suite for UNIX release V.2 from AT&T. There is also SVVS V.3, which verifies UNIX V.3 compliance, and there will be a V.4 verification suite available from AT&T shortly.

Now, to make matters a little more complex, there are also optional kernel extensions in the SVID. They are optional, not mandatory. However, if implemented, you pass the optional tests in SVVS to claim compliance. All releases of A/UX 1.0, 1.0.1, 1.1, 1.1.1, 2.0, and 3.0 pass these optional kernel extensions as well.

So the bottom line is that A/UX 3.0 is SVID V.2 compliant with the optional kernel extensions.

There are different editions of the SVID associated with the different releases of AT&T System V:

SVID

System V

| ----                         | -----     |
|------------------------------|-----------|
| Issue 2, Volumes 1 and 2     | Release 2 |
| Issue 2, Volumes 1 through 3 | Release 3 |
| Issue 3                      | Release 4 |

Our current version of A/UX conforms to SVID Issue 2, Volumes 1 and 2.

## A/UX: Partitioning Third-Party Hard Drives (6/95)

Revised: 6/5/95  
Security: Everyone

A/UX: Partitioning Third-Party Hard Drives (6/95)

Article Created: 7 June 1990  
Article Reviewed/Updated: 5 June 1995

TOPIC -----

I want to use a third-party 320MB hard drive and partition it for use with A/UX.

DISCUSSION -----

To partition non-Apple drives, do the following:

- 1) First, initialize the third-party hard disk drive using SilverLining, FWB Tools, or the utility that came with the drive.
- 2) Launch the HD SC Setup program that came with A/UX on the installation CD-ROM. (NOTE: The Mac OS version of HD SC Setup cannot be used for this task.)

If you have not yet installed A/UX, then boot from the A/UX Installation CD-ROM. Follow the instructions in the A/UX Installation Guide for preparing the disk and installing the A/UX software.

- 3) Partition the hard disk. You should refer to the A/UX Installation Guide section on Performing a Custom Installation for detailed instructions.

Some Important Space Considerations

-----  
In creating a bootable system disk, don't forget to create Autorecovery and swap space partitions and to leave a minimum amount of user free space:

Autorecovery - The Autorecovery partition maintains a copy of the files used in the A/UX startup process so that, if you ever experience a catastrophic system failure with A/UX, the files that are critical to the A/UX startup process can be restored from the Autorecovery partition, if necessary. The Autorecovery partition requires 3 MB of disk space.

Swap space - A/UX provides the ability to use space on a hard disk to increase the computer's memory. The UNIX terminology, this space is called the swap space, and is used to exchange, or swap, portions of files in the computer's memory with those being kept temporarily on the hard disk. The recommended minimum amount of swap space is 18 MB. Generally, swap space should be set to 1.5 to 2 times the amount of physical RAM installed.

User free space - User free space is a portion of each file system not used for storing data. The space is used by the operating system to maintain the files in the file system. The recommended minimum is 5 MB. It cannot be smaller than 2 MB.

It is recommended that you do not create any partitions larger than 1.8 gigabytes in size.

You may also be able to use the "dp" (disk partition) command under A/UX to partition the entire drive. For more detailed information on how to use "dp", refer to dp(1M) manual pages.

#### Article Change History:

## A/UX: Recommended Technical and Reference Materials (9/94)

Revised: 9/19/94  
Security: Everyone

A/UX: Recommended Technical and Reference Materials (9/94)

=====

Article Created: 7 June 1990  
Article Reviewed/Updated: 19 September 1994

TOPIC -----

Can you provide documentation or technical references for the following list of OS nucleus functions?

- Interrupt handling
- Process creation and destruction
- Process stat switching
- Dispatching/process scheduling
- Process suspension and resumption
- Process synchronization
- Interprocess communication
- Manipulation of process control blocks
- Support of I/O activities
- Support of storage allocation and deallocation
- Support of the file system
- Support of a procedure call/return mechanism

DISCUSSION -----

First of all, A/UX is based on AT&T System V R2.2 with BSD 4.3 Extensions, which include networking and software interrupts. Both AT&T System V.2.2 Interprocess communication (Message, Semaphores, and Shared Memory) and BSD Interprocess communication (Sockets) are supported by A/UX. Also, NFS (Network File System) from Sun Microsystems is supported by A/UX; services includes NFS, YP, and RPC (Remote Procedure Calls).

With the A/UX description above, and since UNIX is an industry standard operating system, the references for UNIX kernel functions can be found in any UNIX publications and reference books. A notable one is "The Design of the UNIX Operating System" by Maurice Bach. It covers most of the topics.

BSD 4.3 "UNIX System Manager's Manual" is a good reference for B-Net networking

and Fast File System (UFS) supported under A/UX 2.0 and 3.0.

"Implementing Remote Procedure Calls" by Birrell and B.J. Nelson is good reference for RPC. It was published in ACM Transactions on Computer Systems, Vol. 2 No. 1, Feb 1984, pp. 39-59.

In addition, the "A/UX Network Applications Programming" documentation contains RPC, XDR, NFS, and YP Protocol specifications and a B-Net programming guide.

For UNIX system programming, the following books are recommended:

- "The UNIX Programming Environment" by Brian Kernighan and Rob Pike
- "Advanced UNIX Programming" by Marc J. Rochkind

Also, O'Reilly and Associates, Inc. publishes the "Nutshell Handbook" series which covers a wide range of UNIX and TCP/IP topics.

## A/UX 2.0: How to Start X11 in Color

Revised: 9/18/92  
Security: Everyone

A/UX 2.0: How to Start X11 in Color

=====

Article Created: 7 June 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

#### Configuration

-----

Macintosh IIfx with 8MB RAM and internal HD80 SC

A/UX 2.0b10

External HD80 SC

AppleColor High-Resolution RGB Monitor

X11 Window System (version that shipped with A/UX 2.0b3)

#### Problem

-----

I can get X11 in color by selecting the "Console Emulator" session type and typing:

```
X -screen 0 -depth 8
```

However, I cannot find a way to enable X11 color in such a way that the user can select the "X11" session type and have a color X11 display appear as the default. None of the various .Xdefaults, .x11start, and so on files seems to have an option that tells the X server to expect a color display device. Is there any way to do this, other than via the Console Emulator (or hacking the /usr/bin/X11/X startup script)?

### DISCUSSION -----

Yes, there are two ways to launch X11, the native X11 Window System, under A/UX

2.0. One is choosing from the "A/UX Console Emulator" session type. The other is choosing from the "X11" session type from the login dialog Option menu.

The problem you are experiencing is because the default X11 server startup script (/usr/bin/X11/X) starts up the window in black and white mode. To start up the X11 server in color mode from the "X11" session, modify the "xinit" command line in the /usr/bin/X11/X script file as below (this example is for 8-bit color):

Change:

```
xinit xterm ... -- XmacII -logo -v $* >> $DEBUGLOG 2>&1
```

To:

```
xinit xterm ... -- XmacII -logo -v -screen 0 -depth 8 >> $DEBUGLOG 2>&1
```

## LaserWriter IINTX: Timeout Problems

Revised: 6/29/90  
Security: Everyone

LaserWriter IINTX: Timeout Problems

=====

This article last reviewed: 7 June 1990

TOPIC -----

I have a Compaq PC connected via serial cable to an LaserWriter IINTX. I used terminal emulation to enter PostScript interactive mode and changed the default timeout parameters so that jobs never time out. I want to change these parameters back to a more normal setting.

When I enter the interactive mode and keys in "statusdict begin" followed by a carriage return, the command is processed and the whole job finishes. However, I can't get the LaserWriter IINTX to accept any of the remaining commands required to reset the default settings. Normally, I would get the PS> prompt, but since the change was made to the timeout defaults, this is no longer the case.

- 1) How can I change back to reasonable default times?
- 2) Why am I seeing this problem? Is there something strange going on in the product, or am I doing something that's not permitted?

Nevertheless, printing from applications using the batch mode still works OK, and jobs still seem to timeout.

DISCUSSION -----

Using the following sequence of commands, we were able to set and restore timeout defaults using both batch and interactive modes. Line numbers are for reference in this article only, and are not required by the printer.

```
1 serverdict begin 0 exitserver
2 /helvetica findfont
3 15 scalefont
4 setfont
5 72 700 moveto
```

```
6  /str 20 string def
7  %statusdict begin  0 60 30 setdefaulttimeouts
8  statusdict begin defaulttimeouts str cvs show
9  str cvs show
10 str cvs show
11 showpage
```

What may be confusing in interactive mode is that after typing line 1 the "PS>" prompt is no longer displayed and the printer stops echoing keystrokes to the user. Type line 2 to prove that commands are still accepted by the printer. It returns a notice that it can't find "helvetica" and is substituting courier. Turning local echo on after line 1 will eliminate blind typing.

Commenting out line 7 lets the user power-cycle the printer to see that the changes are permanent. Lines 8, 9, and 10 pop values returned by defaulttimeouts off the stack in the order wait, manual feed, job.

Information on setdefaulttimeouts and defaulttimeouts is available on page 300 of the "PostScript Language: Reference Manual" from Addison-Wesley (ISBN # 0-201-10174-2).

Macintosh IIfx: Non-Apple RAM SIMM Requirements

=====

Article Created: 7 June 1990  
Article Last Reviewed: 13 July 1992  
Article Last Updated:

TOPIC -----

Can you give me the specifications for ordering non-Apple RAM SIMMs for a Macintosh IIfx?

DISCUSSION -----

The Macintosh IIfx requires SIMMs that conform to the following specifications:

- 1 or 4MB capacity--256KB SIMMs are not supported.
- 64-pin (for separate Read and Write lines) versus 32-pin for other Macintoshes. The LaserWriter IINTX uses similar, but slower, 64-pin SIMMs. Macintosh IIfx SIMMs will work in a LaserWriter IINTX, but LaserWriter IINTX SIMMs are too slow for the Macintosh IIfx.
- Fast Page Mode support, like the Macintosh IICi.
- 80ns or faster.

## SMB Server: Connection Solutions

Revised: 6/29/90  
Security: Everyone

SMB Server: Connection Solutions

=====  
This article last reviewed: 7 June 1990

TOPIC -----

I am having difficulty attaching to an SMB server on a Token Ring. Here are my system specifications and my AUTOEXEC.BAT listing:

Macintosh configuration:

- Macintosh IICx
- 1MB RAM
- 40MB hard disk
- 1-bit monochrome monitor
- Apple TokenTalk NB Card
- System 6.0.3, Finder 6.1

Token Ring network:

- IBM PC server running PC LAN 1.32 Extended Services
- Server Name: DOM1
- System software is on drive labeled CDRIVE
- Applications and documents on drive labeled DDRIIVE
- Using 4MB Token Ring Interface cards on PS/2 nodes

AUTOEXEC.BAT listing:

```
date
time
PATH=C:\PCLP13BS;C:\PCLP13XS\DOS;C:\PCLP13XS\NET1_30
prompt $p$g
cls
@ECHO OFF
YNPROMPT Y N 31 Start PC LAN Program 1.3 (Y/N)?
IF ERRORLEVEL 1 GOTO NOPCLP
FASTOPEN C:=100
```

```
NET START SRV DOM1 /XS
IF ERRORLEVEL 1 GOTO NOPCLP
XSDC.BAT
:NOPCLP
```

I know that the cabling is good, because I can successfully connect a PS/2 to the same cables and get a connection. When I use the Macintosh, I enter the server drive/pathname through the SMB DA and select it for connection. I get the message: "The server is not responding", which, according to the manual, means that the name or path specified is incorrect.

I believe that I am entering the name and path correctly, although there seems to be some discrepancy as to whether I should enter server name\path or volume name\path. I can't find anyone who can tell me if this is an SMB server. IBM systems engineers here haven't heard of SMB. If this is not an SMB server, how can I tell, and can it be made into an SMB server?

Originally, the SMB server hard drive did not have a name. I was using the Macintosh pathname as the server name. I tried naming the Drive volume and using that name in the Macintosh DA SMB pathname, but I still had problems.

#### DISCUSSION -----

The Server Message Block protocol is a Microsoft-developed protocol that is used in the IBM PC LAN program and OS/2 LAN server. It is a presentation layer protocol corresponding to Apple Filing Protocol (AFP) in the AppleTalk Protocol Stack. Since this server is running the PC LAN program, it is an SMB server.

- 1) Workstation Name: Workstation Name is the name of your workstation. It tells the network administrator who you are. You can enter any name in this field as long as it has at least one character. The limit is 14 characters. Note that if you are using an OS/2 LAN server, this name must exactly match the username created on the OS/2 server (all in uppercase).
- 2) When you Add an SMB volume name, the format is \\ServerName\VolumeName.

Server Name is found by issuing the NET NAME command on the server machine. In your case, it is DOM1 as also stated in the NET START command in the AUTOEXEC.BAT file.

Volume Name is the same name you specified in the NET SHARE command. For example, the following shares a volume name "EXAMPLES" for read/write access and with password TESTPASS:

```
NET SHARE EXAMPLES = C:\SMB\EXAMPLES TESTPASS /RW
```

Note that you "equate" the path to a volume name in the above NET SHARE command on the server, and then use that volume name when you add the server volume. The hard drive name on the server has nothing to do with this utility.

The password is optional if you did not specify one in the NET SHARE command on the server. For testing until you get it to work, omit the

password. You can always add a password later. If you specify only the root directory of the drive (such as C:\), all files on that drive are available to other computers.

To display the sharing status on the server, issue the NET SHARE command without any parameters: NET SHARE. We suggest that you check into this since we did not see any NET SHARE command in the AUTOEXEC.BAT file. Remember, you need to use NET SHARE to "publish" a volume to be shared.

- 3) Once you have added a volume, select it and click the Connect button. Leave the password field blank, if you did not enter a password in the NET SHARE command on the server.

If the volume is successfully mounted, its name appears in the lower SMB server DA window.

If you add the names of all SMB volumes on your network at one time, later, when you want to access a different volume, its name will already be an option in the Select an SMB volume window.

- 4) Also, make sure that you use the Apple File Exchange shipped with the latest SMB File Transfer Utility.

We hope that this helps to clear the confusion between server name, volume name, pathname, and so on.

## A/UX: Sendmail Problem (9/94)

Revised: 9/21/94  
Security: Everyone

A/UX: Sendmail Problem (9/94)

=====

Article Created: 7 June 1990  
Article Reviewed/Updated: 21 September 1994

TOPIC -----

### Configuration

-----

Macintosh IIfx with 8MB RAM  
2 HD80 SC (external)  
EtherTalk NB Card  
A/UX 3.0

The kernal was generated with:

```
newconfig ae6 bnet appletalk
```

AppleTalk is connected and functioning; however, the system is not yet connected to an Ethernet network.

### Problem

-----

On startup, a core dump file (86016 bytes) is created in the root directory, and a ps -ef shows that "sendmail" is not running. No relevant message appears in the A/UX System Console Window. Using the UNIX command "strings" on /core gives this as the first two lines:

```
sendmail  
/usr/lib/sendmail -bd -q30m
```

from which I deduced that sendmail has crashed during system initialization. Logged in as root, I issued the command:

```
/usr/lib/sendmail -bd -q30m
```

and the system replies:

"Illegal instruction - core dumped"

Can you help?

DISCUSSION -----

During our testing, A/UX 3.0 seems to start the sendmail successfully.

From the error message you got, it seems that the frozen sendmail configuration file (/usr/lib/sendmail.fc) was bad. Have you ever modified the sendmail configuration file (/usr/lib/sendmail.cf) and correctly rebuilt the frozen file?

Note that the /usr/lib/sendmail, /usr/ucb/mailq, and /usr/ucb/aliases files are all hard-linked together with the mode of -rwsr-x-rx root bin 128216 sendmail.

Try to use the "-bt -dX" option to debug the problem. X is the debugging flag list. Each flag has a number and a level; for example, -d3-19.4 sets debugging flags from 3 through 19 and a level 4.

Normally, the sendmail is started up from the /etc/inittab, but to rebuild the frozen file and restart the sendmail:

- 1) Kill the sendmail process if it is running.
- 2) Do /usr/lib/sendmail -bz
- 3) Do /usr/lib/sendmail -bd -q30m

## A/UX: Working with Tape Cartridges (3/95)

Revised: 3/31/95  
Security: Everyone

A/UX: Working with Tape Cartridges (3/95)

=====

Article Created: 12 June 1990  
Article Reviewed/Updated: 31 March 1995

TOPIC -----

I am having trouble working with A/UX and tape cartridges. Can you give me some tips?

DISCUSSION -----

If you want to boot A/UX from the cartridge don't forget to make a swap partition on it and set the kernel value SWAPCNT to the size of the partition. Don't make eschatology partitions. They are for backup; and you don't need to backup the backup disk.

A good way of copying files to a syquest disk is to mount it as /syquest and do

```
find /dir -depth -print | cpio -puldma /syquest
```

which will create /syquest/dir and copy over /dir and all subdirectories to the cartridge. Next time you do it, leave out the "u" in "-puldma" and only files that have changed since the last copy will be copied. Great. This method will also copy over the files in /dev.

You don't need to partition each cartridge. Just format it, make sure block 0 is blank (use dd to check or to clear it) use pname to recognize slice 31 and you can use it as c?d?s31. It won't work under Mac OS, of course. To be able to boot from a cartridge you will need a small Mac OS partition plus root and swap partitions.

If your formatting software does not let you create A/UX partitions then you will have to do them under A/UX using dp. You can also format the cartridge under A/UX using the diskformat command and size 512. I suggest making a script to use dp so that you can do more than one cartridge quickly. An example might be something like:

```
dp /dev/rdisk/c4d0s31 << EOF
I7
al      8   86662 SyQuest y 0 86662 0 1 y y
wq
EOF
```

Make sure you always unmount the disk before removing it. Otherwise, you will lose data. The SCSI disk driver should be modified so that the cartridge can only be removed when a umount is done. This is a simple modification.

Remember to do a fsck on the device before you mount it each time. It's easy to forget, because it is not done automatically (unless you put the drive into /etc/fstab). The consequences of using a disk that has not been fsck'ed can be serious, if there are filesystem errors on the disk that fsck could have fixed. (That is, these errors can occur if the Macintosh crashes, or if you forget to unmount the disk before removing it).

## IEC 950 Standards: All Current Apple Products Meet and Comply

Revised: 6/8/92  
Security: Everyone

IEC 950 Standards: All Current Apple Products Meet and Comply

Article Created: 17 June 1990  
Article Last Reviewed: 1 June 1992  
Article Last Updated:

TOPIC -----

Does Apple design and test equipment to the IEC 950 standard?

DISCUSSION -----

All our latest products (including the Serial NB Card) are designed to meet and comply with IEC 950. Furthermore, compliance of CPUs will be verified via third-party, safety-agency approvals. IEC 950 is a hybrid of the electrical-shock, test side of IEC 380 and the flammability requirements of UL 478. Incidentally, it is also Apple's Safety Specification. Older products were designed to meet IEC 380, but they also met the requirements of UL 478 and, therefore, meet the latest specification (IEC 950).

NuBus cards are in the Safety Extra Low Voltage (SELV) category and, as such, do not contribute to any electrical shock hazard. The PC board is approved to UL 94-V-0. In addition, it does not contain any other hazardous component, like a lithium cell. Therefore, a Macintosh system configured with a Serial NB Card does not pose any safety hazard, and the system meets all the requirements of IEC 950.

## SMB File Transfer: Troubleshooting Macintosh IIx Problems

Revised: 6/29/90  
Security: Everyone

SMB File Transfer: Troubleshooting Macintosh IIx Problems

=====

This article last reviewed: 7 June 1990

TOPIC -----

I am having problems with a Macintosh IIx and SMB File Transfer. I used the 6.0.5 Network Installer disk, and everything seemed to go well. The TokenTalk NB Card is working fine; I can see the zones and devices in the Chooser. Apple File Exchange starts up OK. However, when I try to access the "SMB Servers" choice from the Apple menu, the whole system hangs. I tried using the later versions (1.1.1) of the A/ROSE and TokenTalk Prep files from the MacDFT Golden disk, but I had the same results. Can you help?

DISCUSSION -----

We tested the SMB File Transfer Utility with our Macintosh IIx, and it worked fine. We did not have to use A/ROSE and TokenTalk Prep from the MacDFT Golden disk. We used the version 1.0 SMB software disk, which installs A/ROSE 1.1, PCSession Prep 1.1, SMB 1.0, and TokenTalk Prep 1.1 in the System Folder.

Here are some troubleshooting suggestions:

Check cable connections. Verify that the SMB server is up. Make sure you are using Apple File Exchange 1.1.2. (Earlier versions of AFE will not work.)

- Ensure that you are using version 2.12 ROM on the TokenTalk NB card.
- Remove any INITs in the System Folder that might cause a problem.

If you are still having problems, please send us more information, specifically:

- Hardware and software configurations and versions, including any network hardware and software.
- Other applications on that system, including INITs, CDEVs, and so on.

## Macintosh SE/30,IIfx: Processor-Direct Slot (PDS) Pinouts

Revised: 4/5/93  
Security: Everyone

Macintosh SE/30,IIfx: Processor-Direct Slot (PDS) Pinouts

=====

Article Created: 7 June 1990

### Article Change History

-----

04/02/93 - REVISED

- To incorporate SE/30 more fully into the article (and the title).
- Corrected some pinout errors.

### TOPIC -----

I am developing an accelerator board for the Macintosh IIfx and SE/30 and I need pinouts and any other relevant information for the processor-direct slot. Can you help?

### DISCUSSION -----

The processor-direct slot (PDS) in the Macintosh IIfx is similar to the PDS in the Macintosh SE/30. It has the same Euro-Din 120 connector as the Macintosh SE/30 PDS and Macintosh IICi cache connector.

Cards in the PDS are accessed at 20MHz. This speed should let developers create PDS cards without using expensive components while still providing access to the processor bus. There are two locations in the memory map for PDS cards. Developers should see the "Cards and Drivers Manual" for information on creating PDS cards. This manual is available from APDA.

The cache connector in the Macintosh IICi may look like the Macintosh IIfx PDS connector, but the pinouts are vastly different.

Note: If a Macintosh IICi cache card is placed in the Macintosh IIfx PDS, it will damage the logic board.

Here is the Pinout for the 68030 Direct Slot used in the Macintosh IIfx and

SE/30. SE/30 Descriptions, where they are different, come first, followed by the IIfx description.

## AppleTalk Phase 2: Short-Form Versus Extended-Form DDP Headers

Revised: 6/29/90  
Security: Everyone

AppleTalk Phase 2: Short-Form Versus Extended-Form DDP Headers

=====

This article last reviewed: 7 June 1990

TOPIC -----

Kinetics K-STAR 8.0 supports AppleTalk Phase 2. Under AppleTalk Phase 2, most of the AppleTalk data-link layer changed. Multicast addressing was added, and RTMP was changed quite a bit. Also, the network layer was changed. The short-form DDP header was outlawed. The short-form DDP header is useful only for sending packets within a network, not between networks.

When Kinetics heavily modified K-STAR to support AppleTalk Phase 2, they failed to change the DDP packets their RTMP and ZIP packets were encapsulated in. So, even under K-STAR 8.0, FastPaths send their RTMP and ZIP packets in the short-form DDP header on AppleTalk Phase 1 (non-extended) networks. This seems to work under most circumstances. However, if you run an Apple Internet Router, it expects to see the extended-form DDP headers even on AppleTalk Phase 1 networks. Therefore, even if you use the AppleTalk Phase 2 Upgrade Utility, you still get "Router Version Mismatch" errors.

Why didn't Kinetics switch all their DDP headers to the extended form, which is valid on all networks and always has been? Why would we ever send anything in a short-form header? Why do we even support sending short-form headers since extended-form headers can do everything the short-form ones can?

DISCUSSION -----

In AppleTalk Phase 2, the short-form DDP header is not "outlawed". The short-form DDP header is, and will continue to be, a valid DDP header format.

The extended-form DDP header must be used on all AppleTalk Phase 2 extended networks. Examples of AppleTalk Phase 2 extended networks include EtherTalk 2.x and TokenTalk 2.0.

The short-form DDP header can be used only on non-extended networks, like LocalTalk or EtherTalk 1.x. On a non-extended network, the short-form DDP

header can be used for packets whose source and destination nodes have the same network number. The Link Access Protocol (LAP) header for LocalTalk and EtherTalk 1.0 packets contain the source and destination node IDs. Because of this, the source and destination network numbers and node IDs in the extended-form DDP packet are redundant when the packets source and destination nodes have the same network number.

Short-form DDP headers are used solely for efficiency reasons. In fact, an implementation of DDP is permitted to send extended-header DDP packets even when the source and destination nodes are on the same AppleTalk Phase 1 or non-extended AppleTalk Phase 2 network. For example, the AppleTalk Internet Router uses extended-form DDP headers exclusively, even on non-extended networks, like EtherTalk 1.x.

## Macintosh-to-Sytek Broadband Connectivity

Revised: 6/29/90  
Security: Everyone

Macintosh-to-Sytek Broadband Connectivity

=====

This article last reviewed: 8 June 1990

TOPIC -----

We use a Sytek broadband network with Novell Netware as a standard. Is there any product that lets the Macintosh participate in such a network?

DISCUSSION -----

You should look into a router that routes from LocalTalk or baseband (EtherTalk) to broadband. One such router is the MultiGate 2000 from Network Resources Corporation, which has the ability to connect AppleTalk networks to EtherTalk, broadband, or fiber-optic networks.

The MultiGate 2000 supports Novell, among other network environments, and would give you the flexibility to use LocalTalk or the EtherTalk NB Card, or such Ethernet interface products for compact Macintoshes (and so on, Macintosh SE/30) as the Kinetics EtherPort SE/30. For more information, refer to the Technical Info Library article called "NRC Series 2000 AppleTalk Routers: Description" or contact: Network Resources Corporation.

Other possible solutions are described in the Technical Info library article "Macintosh-To-Novell Netware With AppleTalk" or can be located by searching on "broadband" in the Technical Info library or in either of the buyer's guides on AppleLink. For contact information, search the Technical Info library under "Technical Info library."

## X.400 Solutions for the Macintosh

Revised: 1/19/93  
Security: Everyone

X.400 Solutions for the Macintosh

Article Created: 17 June 1990

### Article Change History

-----  
1/19/93 - UPDATED  
    • Touch Communications, Inc. now SAIC.  
6/8/1990 - REVIEWED  
    • For accuracy.

### TOPIC -----

My company has a growing number of customers in Europe, and we need to communicate (E-mail) with them via the Macintosh. Our corporate backbone already has an X.400 gateway, but we need a front-end, much like AppleLink, to facilitate national and international communication. Is there such an application?

### DISCUSSION -----

Apple used RetixMail for a Macintosh demonstration in Hanover.

Apple Europe demonstrated the WOPODA developer tool at the last Hanover fair. It is based on the ODA (Office Document Architecture) standard and lets you do conversions from any word processor to ODIF (Office Document Interchange Format), a standardized format for documents. We needed an X.400 product to send the ODIF documents to the other vendors (including DEC, IBM, Sun, HP, and so on) and used RetixMail for the Macintosh. Here is some information about Apple's forthcoming solution:

The Apple X.400 product is an X.400-compliant MTA (Message Transfer Agent) that runs on any modular Macintosh under System 7. It includes the seven layers of the OSI model. It works either over X.25 (on top of the MacX25 product) or over 802.3 (this is the most used link in the U.S.). It lets Macintosh users gain access to public X.400 networks or to connect to their private X.400

backbone.

Note that APDA is the distributor for the Apple X.400 product to give developers the opportunity to write client software for it.

There are two existing X.400 solutions for the Macintosh, to our knowledge, from Retix and SAIC (formerly Touch Communications). They are similar in their design: the MTA (Message Transfer Agent = the X.400 server) runs on a PC and the UAs (User Agents = the clients) run on a Macintosh. So, you need one PC, at least, to access the X.400 backbone.

- Retix did a PC-based MTA and created two versions of their own client: RetixMail for the PC and RetixMail for the Macintosh. You have to buy both client and server software to use it.

- Touch took another approach: they did an X.400 gateway for Microsoft Mail and one for QuickMail. Macintosh users who use Microsoft Mail or QuickMail today can keep their existing client software. They just have to buy a PC with Touch X.400 software plus either the Microsoft Mail gateway or the QuickMail gateway to connect to the X.400 backbone.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## A/UX: Trivial File Transfer Protocol (TFTP) Supported (9/94)

Revised: 9/22/94  
Security: Everyone

A/UX: Trivial File Transfer Protocol (TFTP) Supported (9/94)

=====

Article Created: 8 June 1990  
Article Reviewed/Updated: 22 September 1994

TOPIC -----

Do any versions of A/UX supports TFTP host and client?

DISCUSSION -----

The TFTP (Trivial File Transfer Protocol) is part of the standard Internet protocols. A/UX B-Net (Berkeley Network) supports most Internet protocols like TCP, IP, FTP, TFTP, SMTP, ICMP, UDP, and so on.

Yes, the TFTP client and server model have been supported since the first release of A/UX (1.0). /usr/bin/tftp and /usr/etc/in.tftpd in A/UX are the TFTP client and server, respectively.

## Macintosh Display Cards: RGB-to-NTSC Converters

Revised: 7/16/90  
Security: Everyone

Macintosh Display Cards: RGB-to-NTSC Converters

=====

This article last reviewed: 8 June 1990

TOPIC -----

Do you know of a device that can convert the color RGB signal (interlaced) from the new video cards to NTSC? Does it have the correct grounding for the sense pins to put the Display Card 8/24 into interlace mode and let the convolution (in 8-bit color) work?

DISCUSSION -----

RasterOps has announced an RGB-to-NTSC converter device. It is mentioned in the RasterOps ad in the June 1990 Macworld (pages 114-115). We have also received a marketing flyer on this converter. The name of the product is the RasterOps Video Expander.

The sense pin issue is normally handled in the cable configuration. This eliminates any concern over the converter having to deal with the card configuration. Engineering has tested an early version of the converter with the new cards. It appears that the shipping converter will work with the Macintosh Display Cards. We have not yet had one to test. However, the Display Card marketing group assures us that everything will be fine.

Another RGB-to-NTSC converter is from Computer Video. Their product, Video NTSC Encoder, provides another solution for converting the High-Resolution 8-Bit Macintosh Video Cards to an NTSC output signal. We believe this converter box will work with the new cards. It uses the configuration of the cable to tell the new Macintosh Display Cards which mode to use.

For more details, search the Technical Info library under "Computer Video" and "RasterOps."

## Mirror Backup Solutions for the Macintosh

Revised: 6/29/90  
Security: Everyone

Mirror Backup Solutions for the Macintosh

=====

This article last reviewed: 8 June 1990

TOPIC -----

I heard that there is a mirror-backup solution for the Macintosh called "Reflections" that is sold by Profyle Computers, Ltd.

DISCUSSION -----

Profyle creates mirror systems, not just the software. They have complete software and hardware systems for doing mirror backups. The drives range from 100MB to 1.2GB. Currently, Profyle has no U.S. distribution. For more details, search the Technical Info library under "Profyle" and "Natural Intelligence."

A similar type of backup utility was recently announced. Natural Intelligence publishes a product called "Shadow", which does automatic backups.

Shadow periodically copies the documents that have changed since they were last backed up. Shadow can back up onto any kind of disk, network server, or Finder-mountable tape drive.

## LocalTalk or PhoneNET: Cable Tester

Revised: 6/29/90  
Security: Everyone

LocalTalk or PhoneNET: Cable Tester

=====

This article last reviewed: 11 June 1990

TOPIC -----

Do you have a recommendation for a LocalTalk circuit tester?

DISCUSSION -----

We found this article in the Redgate Buyer's Guide Library on AppleLink:

"The AT-Tester is a LocalTalk network cable tester that can test both LocalTalk cables (Mini DIN 3) or PhoneNET cables (RJ-11).

"A user can ensure total circuit integrity in Mini DIN 3 cables by plugging the cable into the power unit and plugging the remote end to the test unit. The tester will then show a user what the problem is. The telephone cable is tested the same way, but using the RJ-11 ports mounted beside the Mini DIN 3 port on either side of the unit."

For more details, search the Technical Info library under "AESP, Inc."

## ImageWriter II: Text Collides When Printing in Courier 9 and 10

Revised: 6/29/90  
Security: Everyone

ImageWriter II: Text Collides When Printing in Courier 9 and 10

=====

This article last reviewed: 11 June 1990

TOPIC -----

I have a Macintosh SE running System Software 6.0.4. I use several word processing programs, mostly Microsoft Works 2.0. When I print in Courier 9-point, the ImageWriter II runs words together, either by not spacing between words or by printing the first letter of one word over the last letters of the preceding word. In effect, this is a horizontal compression problem.

I was able to duplicate this problem with a different ImageWriter II attached to a Macintosh II. When I ran Microsoft Works, the text was compressed in a number of places. I didn't test other font sizes.

Can you explain what is happening?

DISCUSSION -----

We were able to duplicate the problem when printing in "Best" mode. We tested other fonts in 9-point and found that only Courier showed these problems. Courier 10 is actually worse than Courier 9.

We don't have an explanation and have forwarded print samples and test results to the proper organization.

## LaserWriter IINTX & Macintosh IIfx: SIMM Speeds Different (3/94)

Revised: 3/31/94  
Security: Everyone

LaserWriter IINTX & Macintosh IIfx: SIMM Speeds Different (3/94)

Article Created: 11 June 1990  
Article Reviewed/Updated: 31 March 1994

TOPIC -----

Why aren't SIMMs for the Macintosh IIfx and the LaserWriter IINTX interchangeable? What are the differences, and what are the reasons for not interchanging them?

DISCUSSION -----

The pinouts for the Macintosh IIfx and LaserWriter IINTX SIMMs are the same and both have nearly identical SIMM requirements, but the Macintosh IIfx requires SIMMs rated at 80ns or faster, while the LaserWriter IINTX only requires RAM rated at 120ns.

Macintosh IIfx 1MB SIMMs will work in a LaserWriter IINTX, if they fit physically (see Note), but standard LaserWriter IINTX SIMMs will not work in the Macintosh IIfx because the RAM is too slow.

Overall, we recommend that you use Macintosh IIfx SIMMs in Macintosh IIfx systems and LaserWriter IINTX SIMMs in LaserWriter IINTX printers.

NOTE: The LaserWriter II chassis opening limits the height of SIMMs used on the LaserWriter IINTX logic board. We found that some 1MB SIMMs are too tall, and the LaserWriter IINTX logic board will not slide into the chassis when they are inserted.

## Macintosh-to-DEC Printer Solutions

Revised: 2/1/91  
Security: Everyone

Macintosh-to-DEC Printer Solutions

=====

This article last reviewed: 18 December 1990

TOPIC -----

I need to interface a DEC LN03R printer to a Macintosh II. Do you have any suggestions?

DISCUSSION -----

We are assuming that you are talking about the Digital ScriptPrinter LN03R.

To connect the ScriptPrinter directly to the serial port of the Macintosh, you need a cable with the correct pinouts to support all signals between the printer and the Macintosh. Second, even though the ScriptPrinter is PostScript-controlled, you need a driver on the Macintosh so you can select from the Chooser. To our knowledge, there is no such driver. One alternative is to print to a disk file from the application, and send the file to the printer using a terminal emulation program. With the correct cable, you can communicate to the printer using a terminal emulation program, like MacTerminal, over the serial port. This is not very convenient.

Another alternative is to use the printer on the network. With Alisa Digital Printer (ADP) support system, an option for AlisaTalk for VAX/VMS, Macintosh users can print to Digital PostScript devices, such as the LN03R ScriptPrinter and the PrintServer 40. To the Macintosh user, the Digital PostScript device looks like an Apple LaserWriter.

ADP makes use of VMS system queueing and printing. Features include forms and paper-type control, optional job-flag and trailer pages for job identification, paper tray selection, and support for the Adobe system typeface pack. One VMS receiver process handles all Macintosh users; a new process for each job is not necessary. The software uses standard Digital Print symbionts and automatically loads the Laser Prep dictionary to the front of each Macintosh job submitted.

Another product called PacerPrint from Pacer Software, Inc., offers similar features. For more information on the Alisa Digital Printer support system or PacerPrint, search the Technical Info library using keywords "Alisa or Pacer".

Finally, PATHWORKS (formerly LanWORKS) for Macintosh, the new Apple-Digital Alliance product announced May 1, 1990, available later this year, will offer this capability. The service is called VAXshare Print Server, and it will support Digital's LPS20, LPS40, ScriptPrinter LN03R, and Apple's LaserWriter, LaserWriter Plus, LaserWriter IINT, and LaserWriter IINTX.

## CD Remote: Controls Only the First of Multiple CD-ROM Drives

Revised: 6/16/92  
Security: Everyone

CD Remote: Controls Only the First of Multiple CD-ROM Drives

=====

Article Created: 11 June 1990  
Article Last Reviewed: 29 May 1992  
Article Last Updated: 29 May 1992

TOPIC -----

How will the desk accessory "CD Remote" act if more than one CD-ROM unit is hooked to a Macintosh, and standard CD audio disks are placed in all drives?

DISCUSSION -----

If more than one Apple CD-ROM device is used on a Macintosh computer, the device with the lowest SCSI number is the unit that CD Remote will control. As an example, two CD-ROM devices are on the SCSI bus. One has a SCSI ID of 2 and the other has an SCSI ID of 5. The CD-ROM device with the SCSI ID of 2 will be the unit accessed by CD Remote. There is no way to change this.

## A/UX: Domain Names: Plus Sign (+) not Allowed (9/94)

Revised: 9/20/94  
Security: Everyone

A/UX: Domain Names: Plus Sign (+) not Allowed (9/94)

Article Created: 11 June 1990  
Article Reviewed/Updated: 20 September 1994

TOPIC -----

I have a Macintosh IIfx running A/UX that is connected to an Internet consisting of Sun and VAX servers with several kinds of workstations. The problem is that I must begin my domain name with the plus sign (+), and A/UX does not recognize the plus sign as part of the name.

Do you know of a fix for this problem?

DISCUSSION -----

Naming conventions for Domain, Host, Net, and Gateway should follow the rules specified in RFC (Request For Comments) 952. Here is part of RFC-952 regarding the naming convention on the Internet:

A "name" (Net, Host, Gateway, or Domain name) is a text string up to 24 characters drawn from the alphabet (A-Z), digits (0-9), minus sign (-), and period(.). Note that periods are only allowed when they serve to delimit components of "domain style names". No blank or space characters are permitted as part of a name. No distinction is made between upper and lower case. The first character must be an alpha character. The last character must not be a minus sign or period.

Apparently, a domain name beginning with the plus sign (+) violates the RFC-952 naming convention. We think that A/UX "BIND" (Berkeley Internet Name Domain) follows the naming convention described in RFC-952; the plus sign (+) is not allowed in the domain name.

We don't think there is a workaround on A/UX, unless the customer name server host follows the RFC-952 naming convention.

## Floppy Disk Failure: Possible Causes (11/94)

Revised: 11/17/94  
Security: Everyone

Floppy Disk Failure: Possible Causes (11/94)

=====

Article Created: 11 June 1990  
Article Reviewed/Updated: 17 November 1994

TOPIC -----

Our office has experienced what seems to be a high failure rate with diskettes. In what ways can disks be damaged and what can be done to prevent further problems?

DISCUSSION -----

Disk wear results mostly from time in use. Abnormal disk wear is usually caused by unclean environments or misaligned or dirty mechanisms. Cigarette smoke, hair (human or pet), and dust all contribute to disk failure.

You might want to invest in a head-cleaning device. Check the industry periodicals for reviews and pick the least abrasive one.

## Everex Backup Problem

Revised: 6/29/90  
Security: Everyone

Everex Backup Problem

=====

This article last reviewed: 11 June 1990

TOPIC -----

Our file server is a Macintosh SE with 4MB RAM and two external 80MB hard drives running System Software 6.0.2. One hard drive is partitioned into two volumes. When I try to backup one of the volumes on the partitioned drive to an Everex 91/60 using Everex Backup Software, I get System Error 28. (The other volumes back up without any problems.) Can you explain this?

DISCUSSION -----

The EMAC engineer we spoke with indicated that Error 28 typically means too many files have been selected for backup. They suggest either starting up from the EMAC Utility disk for the backup or performing multiple backups with a smaller number of files. For more information, contact their tech support.

## Side-by-Side Monitors Can Interfere with each Other

Revised: 6/29/90  
Security: Everyone

Side-by-Side Monitors Can Interfere with each Other

=====

This article last reviewed: 11 June 1990

TOPIC -----

I have a customer who bought an Apple RGB monitor and an Apple Two-Page Monochrome monitor to sit side-by-side. The monitors interfere with each other, so badly that I'm ready to send each of them back and buy third-party products. Anyway, what can be done to have both those monitors side-by-side without any screen warping?

DISCUSSION -----

We found the following in the Technical Information Library using "monitor and interference" as a search string:

Apple Two-Page Monochrome Monitor: Images Vibrate

Interference between two monitors placed side-by-side can cause images on the monitors to vibrate. The reason is that, when placed side-by-side, monitors can magnetically interfere with each other, causing the image on one or both monitors to appear to vibrate slightly. This interference problem is most often seen when an RGB color monitor is placed next to a large-screen monochrome monitor. The amount of interference can also vary depending on the user's environment.

Moving the monitors further apart, especially the rear ends, usually reduces the vibration effect.

Technical Reason For Picture Vibrating

-----

The cause of this shimmering effect lies in the vertical refresh rate, the number of times a monitor repaints the screen each second. When this rate differs significantly between monitors, the interference described above can occur. There is often a large difference between RGB and monochrome monitors. Thus, the vibration effect most often occurs with this combination. Because

other factors are involved, it is possible for two monitors with the same refresh rate to exhibit this effect, although this is less frequent.

Shielding monitors so as to prevent this type of interference would add a great deal to the cost of each monitor. Further, by shielding a monitor you can prevent the monitor from interfering with other monitors, but other monitors could still interfere with it. Apple is investigating a number of technologies to prevent this interference in the future and plans to incorporate them as they become feasible.

We are sorry that we cannot solve your problem at this time, but you may see an improvement if:

- the orientation of the monitors is reversed
- the monitors are separated by 8-10 inches
- a metallic plane (foil-wrapped cardboard, for example) is placed between the monitors.

## AppleShare: How To Change Network CDEV to EtherTalk

Revised: 6/29/90  
Security: Everyone

AppleShare: How To Change Network CDEV to EtherTalk

=====

This article last reviewed: 11 June 1990

TOPIC -----

When using a Macintosh II family machine equipped with EtherTalk cards and running EtherTalk only, as an AppleShare server, how do I change the Control Panel's Network setting to EtherTalk?

Once AppleShare is up and running, the Network CDEV cannot be changed to EtherTalk because AppleTalk is active. The Chooser won't let me turn off AppleTalk.

If I have the AppleTalk Internet Router running on the machine, it's no problem because the ATIR handles the change.

DISCUSSION -----

Here is a simple way to do this:

- 1) Start up the Macintosh with a floppy, system disk.
- 2) Set the startup application for the Macintosh hard disk to be the Finder. This prevents AppleShare from starting automatically the next time the Macintosh is started up.
- 3) Restart the Macintosh from the hard disk. It should boot to the Finder.
- 4) Use the Network CDEV to change from Built-in to EtherTalk.
- 5) Open the Server Folder and select the AppleShare File Server application (click it once). Set it as the startup application using the Special menu's Set Startup option. Be sure you don't select MultiFinder in this step, because the AppleShare File Server software is not MultiFinder-compatible.
- 6) Restart the Macintosh, and it should boot to the AppleShare File Server

software, now using EtherTalk instead of LocalTalk.

Note that with EtherTalk version 1.2 and later, you can switch network connections without going through this process. The CDEV alerts you that network services will be disconnected and unavailable until restarting. A cancel option is available.

## Macintosh-to-DEC: Integration Issues (1/95)

Revised: 1/30/95  
Security: Everyone

Macintosh-to-DEC: Integration Issues (1/95)

=====

Article Created: 18 December 1990  
Article Reviewed/Updated: 30 January 1995

TOPIC -----

A new building, with approximately over 400 Macintoshes, is being set up with a full Ethernet-based network. All the workstations will be Macintosh IIci 8/80 systems, with a variety of DEC and Apple file- and data-servers. The cabling system to be used is thin-wire coax, with either thick-wire or fiber risers (ideally FDDI) in the building, leading to two wiring closets on each floor.

From each of the two closets, one strand of star-wired coax will extend to each workstation. Although it may seem strange, this cabling architecture has been decided upon before the network protocol and data distribution method has been finalized. As I understand it, DEC DEMPRs will be used for coax cable distribution, and some form of DEC bridge installed for DECnet traffic isolation, but this is subject to change.

I am unsure what routers/bridges are available for AppleTalk, DECnet, and AppleTalk and DECnet traffic management.

Obviously, the AppleTalk InternetRouter is not a major player, as it can only route AppleTalk packets. DECnet packets, and, therefore, AppleTalk packets embedded ("tunneled") within DECnet packets would simply not get through. However, is there something in PATHWORKS for Macintosh that will act as a gateway between AppleTalk and DECnet? If so, how does this work? Layered on top of AppleTalk Internet Router perhaps? What products would you suggest, either from Apple, DEC, or third-party product families, that we should take a look at?

Finally, do you know of any Macintosh-familiar contacts in DEC who we could contact from this end on DEC-specific issues?

DISCUSSION -----

Just so we are together on this, bridges operate at Layer 1 and the Media Access

Control (MAC) sublayer of Layer 2 of the seven-layer Open Systems Interconnection model, and they route packets according to the destination address. Bridges, therefore, are protocol-transparent and allow networks to be constructed using multivendor products and multiple protocols.

Routers, on the other hand, operate at the network layer (Layer 3) of the OSI model and use the protocol information contained within the packet to determine how packets should be routed. In the past, routers were limited by their ability to handle only a single protocol. That's no longer the case.

Many of the newer bridges have multiple communications ports and route packets according to protocol, packet type, and packet length. These are often called "routing bridges."

The following routers support both DECnet and AppleTalk:

Cisco Systems's AGS is a self-learning/load-balancing router that connects 802.3 to 802.5 networks. Protocols supported are TCP/IP, OSI, XNS, DDN, X.25, DECnet, AppleTalk, and Novell's Internetwork Packet Exchange (IPX). It supports the Spanning Tree Protocol, source routing, up to 8 local nets and 14 wide-area net interfaces per unit at up to 4M bits/second. It supports RS-232-C, RS-449, and CCITT V.35. Net management supported is Simple Network Management Protocol (SNMP).

Network Equipment Technologies' LANExchange 50 is a self-learning/load-balancing router that connects 802.3 to 802.5 networks. Protocols supported are TCP/IP, DECnet, XNS, X.25, and AppleTalk. It supports the Spanning Tree Protocol, source routing, up to 24 local nets, and 24 wide-area net interfaces per unit at 1200 to 4M bits/second. It supports RS-232-C, RS-449, and CCITT V.35. Net management supported is Simple Network Management Protocol (SNMP).

Wellfleet Communications, Inc.'s Link Node/Concentrator Node is a self-learning/load-balancing router that connects Ethernet Versions 1 and 2; 802.3 to same local net. Protocols supported are TCP/IP, XNS, IPX, OSI, and AppleTalk. It supports the Spanning Tree Protocol, up to 26 local net on Concentrator Node; 8 on Link Node and up to 52 wide-area interface on Concentrator Node; 16 on Link Node. It supports RS-232-C, RS-449, CCITT V.35, T-1 DS1. Network management supported is SNMP and 802.1.

The AppleTalk/DECnet Transport Gateway in PATHWORKS for Macintosh allows users on one network to access services on the other network. It performs transport relay from DECnet NSP to and from AppleTalk Data Stream Protocol (ADSP). An example of use is running MacX on a Macintosh using a VAX DECwindows client. Without the gateway, the Macintosh needs to run DECnet protocol to talk to DECwindows on the VAX. With the gateway, the Macintosh can run AppleTalk and still can use the VAX DECwindows as its client.

With AppleTalk for VMS 3.0, one can use the VAX as a DECnet and AppleTalk router. With DECnet routing and AppleTalk routing turned on, the VAX can be used to route traffic between two AppleTalk networks. Network management is done via a new management utility called ATK\$MANAGER.

For any DEC-specific issues, you may try the AppleLink address DIGITAL.SELL,

Apple's DEC team.

## Display Card 8/24 GC: Compatible Third-Party Monitors

Revised: 7/16/90  
Security: Everyone

Display Card 8/24 GC: Compatible Third-Party Monitors

=====

This article last reviewed: 12 June 1990

TOPIC -----

I ordered a Macintosh IIfx with the Display Card 8/24 GC. I am also considering a Radius or RasterOps monitor. Do our 24-bit video cards support third-party, large, color monitors?

DISCUSSION -----

SuperMac is the only company that we are aware of that makes monitors that work with the Display Card 8/24 GC. SuperMac is selling two new monitors that work with the new Apple video cards. One is the "Color Two-Page Display" and the other is the "Platinum Two-Page Display."

Both these monitors have a display resolution of 1152 x 870 pixels. The Display Card 8/24 GC will support up to 8 bits per pixel on these monitors.

## MacX25: List of Supported X.25 Functions

Revised: 6/29/90  
Security: Everyone

MacX25: List of Supported X.25 Functions

=====

This article last reviewed: 13 June 1990

TOPIC -----

I need the facts for the following MacX25 categories:

Packet retransmission support  
Closed user group with in- and outgoing access  
In- and outbound calls barred  
In- and outbound calls carred with a c.u.g.  
One way logical channel incoming and outgoing  
Multi-link procedures  
Direct call  
Hunt group  
Flow control parameter negotiation  
Abbreviated address calling

DISCUSSION -----

Much of this information is in the manual. We assume you want to know if MacX25 "supports" the following X.25 functions:

|                                                |                                                   |
|------------------------------------------------|---------------------------------------------------|
| Packet retransmission support                  | No                                                |
| Closed user group with in- and outgoing access | Yes                                               |
| In- and outbound calls barred                  | Yes                                               |
| In- and outbound calls carred with a c.u.g.    | Yes                                               |
| One way logical channel incoming and outgoing  | Yes                                               |
| Multi-link procedures                          | No (No X.25 "MultiLink Operation")                |
| Direct call                                    | N/A (but does have Call Redirection Notification) |
| Hunt group                                     | N/A                                               |
| Flow control parameter negotiation             | Yes                                               |
| Abbreviated address calling                    | Yes (implimented via configurable address         |

## Retrospect: Incompatible with Tape Disk Init

Revised: 8/24/93  
Security: Everyone

Retrospect: Incompatible with "Tape Disk" Init

=====

This article last reviewed: 12 June 1990

TOPIC -----

I got a copy of Dantz Development Corporation's Retrospect backup software to use with my Apple Tape Backup 40 SC drive, but it doesn't seem to work.

DISCUSSION -----

Dantz Development Corporation, the makers of Retrospect (the site licensed archival/backup software) have found an init conflict between Retrospect and the Apple Tape Backup 40 SC drive's "Tape Disk" INIT.

Essentially, "Tape Disk" is an init that lets the user mount any tape inserted into the Apple Tape Backup 40SC drive onto the desktop. However, Retrospect also has an INIT called "Retro.SCSI" that has been optimized for use with the Apple Tape Backup 40 SC unit.

Thus, if "Tape Disk" is present in your System Folder and loads at startup, Retrospect will be unable to recognize the Apple Tape Backup Unit, (even if Retro.SCSI is not present in your System Folder) whether or not it can be seen using a diagnostic SCSI utility, such as the "SCSI probe" CDEV.

To fix this problem, remove the "Tape Disk" init from your System Folder and restart your Macintosh. Retrospect should recognize your Apple Tape Backup 40 SC unit at that point.

## Macintosh SE: Video Display Linearity Adjustments

Revised: 6/23/90  
Security: Everyone

Macintosh SE: Video Display Linearity Adjustments

=====

This article last reviewed: 12 June 1990

TOPIC -----

Using a Macintosh SE, I have drawn three circles of equal size on the same horizontal axis. The circles are touching. When I measure the diameter of the circles on the screen, I find that although the right-hand one is OK, the left-hand one is 1/8 of an inch too narrow.

What's the official way of measuring screen linearity? What is the acceptable tolerance? Does Apple set up the CRT magnets or are they set up by the CRT supplier? How do I have them reset?

DISCUSSION -----

Acceptable tolerance for linearity is approximately 10 percent (horizontal and vertical). That is, an object moved from one place to another will grow or shrink by no more than 10 percent. The CRT magnets, installed by the supplier, are extremely difficult to adjust and should not be moved, even by a service representative. There is no way to adjust linearity of the Macintosh SE display. Apple Manufacturing has developed test patterns to measure linearity.

If the user is dissatisfied with the appearance of the display, the analog sweep PRINTED CIRCUIT BOARD should be replaced by an authorized service provider.

## Display Card 8•24 GC: Using With Different Monitors (11/94)

Revised: 11/7/94  
Security: Everyone

Display Card 8•24 GC: Using With Different Monitors (11/94)

=====

Article Created: 23 June 1990  
Article Reviewed/Updated: 07 November 1994

### TOPIC -----

Someone told me that if I had a Macintosh Display Card 8•24 GC installed for one monitor, and a number of other cards for other monitors (Apple or third party), that all the monitors would benefit from the Macintosh Display Card 8•24 GC, as it will accelerate QuickDraw for the other monitors as well.

Is this correct?

### DISCUSSION -----

When multiple display cards are installed, the Macintosh Display Card 8•24 GC accelerates drawing in frame buffers of the Macintosh Display Card 4•8, Macintosh Display Card 8•24, and other frame buffer cards.

The Macintosh Display Card 4•8 and Macintosh Display Card 8•24 show the most improvement because they support slave NuBus block transfers and many other display cards do not.

Acceleration for frame buffers other than the one resident on the Macintosh Display Card 8•24 GC would not be as dramatic because of the greater amount of NuBus traffic required.

Only one Macintosh Display Card 8•24 GC may be used for graphics acceleration in a system. If two cards are present, one must have its acceleration function disabled.

Article Change History:

## 5208 Protocol Converter: Macintosh Substitute For Dial3X

Revised: 4/18/91  
Security: Everyone

5208 Protocol Converter: Macintosh Substitute For Dial3X

=====

This article last reviewed: 14 June 1990

TOPIC -----

I use "Dial3X" to access my IBM AS400 via the IBM 5208 protocol converter.

Dial3X is full 5250 emulation using the 5208 FILEXFR protocol. I'm looking for a Macintosh software solution. Do you know of any software for the Macintosh that is equal to Dial3X?

DISCUSSION -----

The 5208 Protocol Converter provides support for "non-IBM ASCII terminals", meaning that it supports VT100, and probably other terminal types too.

After you find out which terminals are supported, you can choose from a wide range of emulators available for the Macintosh, or merely use a VT100 emulator such as MacTerminal or MicroPhone II. You will also need to verify what kind of file formats are being used, and what file transfer methods are provided by the 5208, but one or more of the commonly used generic types of transfer programs will likely be supported by the 5208 and terminal emulators.

## MacX: Can't Start Remote VAX Applications on MultiNet (1/95)

Revised: 1/30/95  
Security: Everyone

MacX: Can't Start Remote VAX Applications on MultiNet (1/95)

Article Created: 14 June 1990  
Article Reviewed/Updated: 30 January 1995

TOPIC -----

This article discusses why MacX is unable to start up remote applications on VAX systems running MultiNet.

DISCUSSION -----

We have been testing MacX in a DECwindows, VMS/Multinet environment and were never able to get it to work successfully.

We have been working with TGV technical support to find out why MacX is unable to start up remote applications on VAX systems running MultiNet. We were able to get DECwindows applications to display on the MacX server using TCP/IP transport (no DECnet transport, since we don't have that connection tool on my Macintosh), only if we started the application manually on the VAX. We were unable to use the MacX "Remote" menu to start the applications from the Macintosh. The problem was traced to a problem in the rexec server on the VAX.

MultiNet is based on the UC Berkeley implementation of TCP/IP. This is a fairly robust implementation of TCP, since it has been around since about 1982 and has been tuned significantly over the years. However, the Berkeley people added the notion of "privileged ports" to their implementation of TCP.

A TCP port number is a 16-bit integer which identifies individual applications on the same host. In the UCB world, port numbers 1-1023 are considered "privileged," and only the superuser is allowed to access them. The UCB rshell and rlogin protocols use this concept to do remote authentication without sending passwords over the network. The basic idea is that if a request comes in from a privileged port on the remote host, then it must be the superuser making the request, so the server "trusts" the requester. The authentication procedure then proceeds without the use of passwords (I'll not bore you with the details). If the requester is not using a privileged port, then the request is denied (i.e. the server closes the connection). (Aside: if the host on which

the requester resides does not have the concept of a privileged port, then it could conceivably allow anyone to open a port in the range 1-1023 and thus spoof the UCB rshell/rlogin servers. This makes the privileged port concept a bad idea.)

MacX does not use the rshell protocol; it uses the rexec protocol instead. Rexec does not use the privileged port authentication scheme, but instead relies on the username and password being sent over the network. The MultiNet rexec server erroneously checks to make sure that the requester is using a privileged port and closes the connection if it is not. This behavior is incorrect. Rexec does not use the privileged port number scheme, so it should not do this check. The rexec server distributed with UCB-based UNIX systems (like Ultrix and SunOS) is implemented properly, so it does not do the check. That is why MacX interoperates well with UNIX, but not with VMS/MultiNet. I do not know if other TCP/IP implementations for VMS have this problem or not. Oh yeah, since A/UX contains the UCB networking code, including the r-utilities, it works fine as well.

Please note that the problem is not in VMS DECwindows, nor is it in the interaction between DECwindows and the TCP/IP transport provided by MultiNet. We know this because we were able to start up DECwindows clients from the VAX and that worked properly. The problem is only with the MultiNet rexec server erroneously checking for a privileged port from the requester, and TGV has indicated to me that the problem will be fixed in MultiNet V2.2. This problem will not affect using MacX with the DECnet connection tool, since DECnet obviously doesn't use the rexec protocol. It will also not have any affect on other implementations of TCP/IP for VMS, unless they have the same problem.

## LaserWriter: Prepping a LaserWriter on a Mixed Network

Revised: 6/23/90  
Security: Everyone

LaserWriter: "Prepping" a LaserWriter on a Mixed Network

=====

This article last reviewed: 14 June 1990

TOPIC -----

Is it possible to prep an Apple LaserWriter II without a Macintosh on the network?

I have mixed PCs, UNIX, and Macintoshes on LocalTalk network. I turn off the LaserWriters at night but in the morning a Macintosh user may not be the first person that prints. Does AppleShare PC handle this? Is there a TEXT PostScript version of the LaserWriter prep we can download via other types of CPU? Any idea on this topic would be appreciated.

DISCUSSION -----

AppleShare PC does not require that a LaserWriter be "prepped" by a Macintosh, or by sending a prep file from the PC before printing. It is capable of printing to a LaserWriter without any Macintosh assistance.

Some programs do require features that are only available in downloaded dictionaries, but these products typically include their own LaserWriter driver that handles this. If a user writes PostScript code on the PC that requires features provided by Laser Prep, they can extract the substance of Laser Prep from a Macintosh, and then download it from the PC along with their code.

Capturing the Laser Prep code on a Macintosh can be done by separating it from any PostScript file that has been generated, by holding down Command-K at print time. Here is the procedure:

- 1) Use the Chooser to select a LaserWriter, and turn off Background Printing.
- 2) Open a word processor and create an empty document.
- 3) Choose the Print... command in the File menu.

4) Click OK.

5) Immediately hold down the Command and k keys.

- the k key dumps a PostScript image with Laser Prep
- the f key would dump a PostScript file without Laser Prep

Hold the keys down until you see the Print Status dialog box.

The Print Status dialog box will say "Creating PostScript File." When the program is through printing, you will find a text file in the current application's folder called "PostScriptn," where n is a number that increments from 0 for each print job. If this is your first try, the file should be named "PostScript0."

Now that you have the PostScript file, you can extract the Prep section by editing it with your word processor. Cut out the section at the end that represents the empty print job. It should begin after the file's first blank line and look something like this:

```
T T 0 0 730 552 -31 -30 761 582 100 72 72 1 F F F F T T T F psu
(Bill's Macintosh IIX; document: Untitled)jn
...and so on...
```

What remains can be transferred to the PC, and downloaded from there to the LaserWriter whenever needed (along with the user's code).

MacTCP: List Of Applications

=====

This article last reviewed: 14 June 1990

TOPIC -----

Is there a list of all commercial and public domain programs that use the Apple MacTCP driver or that allow the Macintosh onto a TCP/IP network (either through a DDP/IP gateway or directly onto Ethernet)?

DISCUSSION -----

The following is a substantial, but by no means complete, list of programs that use MacTCP:

Commercial Products that use MacTCP

-----

MacX from Apple

HyperCard MacTCP Toolkit from Apple (APDA)

TCP/Connect (Telnet: VT240, TN3270, TEK 4014, FTP, Mail, News) from InterCon

MacPathWay Access (Telnet: VT240, TN3270, FTP, SMTP mail) from Wollongong

NetOne TCP for Macintosh (FTP, Telnet) from Ungermann-Bass

TCPort Host Access (FTP, Telnet) from Novell

Database access from Oracle and Informix (WingZ)

TGRAF (Tektronix 4017) graphics emulator from Grapoint

Mathematica (mathematical modeling) from Wolfram Research

GatorMail SMTP gateway from Cayman Systems

Exodus (X window server) and a VT 220, 240, 241 emulator from White Pine Software

Non-commercial Products that use MacTCP  
-----

MacIP, MacMH (FTP, Telnet, Mail) from Stanford University

NCSA Telnet from NCSA, University of IL

3270 emulator from Brown University

BeaverGate SMTP gateway for QuickMail

For more information, search the Technical Information Library under the names of the various vendors.

## TCP/IP & AppleTalk Packets Can Coexist Under A/UX (9/94)

Revised: 9/13/94  
Security: Everyone

TCP/IP & AppleTalk Packets Can Coexist Under A/UX (9/94)

=====

Article Created: 14 June 1990  
Article Reviewed/Updated: 12 September 1994

TOPIC -----

Is it possible to have both TCP/IP and EtherTalk available and active at the same time under A/UX? If so, what is the procedure for doing this?

DISCUSSION -----

AppleTalk (via either EtherTalk card or LocalTalk serial port) is supported under A/UX. AppleTalk printing and File Sharing services are two examples of this. A/UX also supports TCP/IP networks, so that A/UX users can connect to networks of computers running a variety of UNIX-based operating systems. Both EtherTalk and TCP/IP use the Ethernet hardware, and they can use the same Ethernet card. AppleTalk and TCP/IP are not mutually exclusive. That is, a computer running A/UX can be connected to a TCP/IP network at the same time that it is connected to an AppleTalk network.

You can connect a computer that is running A/UX to a LocalTalk network or to an EtherTalk network. Earlier versions of A/UX required a user who logged in as root to modify the /etc/appletalkrc file to select LocalTalk or EtherTalk. With A/UX 3.0, any user who can log in by using the Finder control panel to select LocalTalk or EtherTalk. The /etc/appletalkrc file is no longer provided.

For TCP/IP, once you have determined the values of the TCP/IP configuration parameters for your Macintosh, you can run newconfig to make a kernel that supports the TCP/IP networking software. To run newconfig, log in as root in the Finder environment and open a CommandShell window, or log in as root in the Console Emulator.

Type the command:

```
newconfig bnet
```

Respond to the prompts that newconfig displays. When you have finished, restart the computer.

You can get additional information on this process by referring to the A/UX Network System Administration manual chapter on Configuring and Managing a TCP/IP Network.

## How IIGS Network Can Print From Single 3.5 Drive

Revised: 6/23/90  
Security: Everyone

How IIGS Network Can Print From Single 3.5 Drive

=====

This article last reviewed: 14 June 1990

TOPIC -----

I want to assemble an Apple IIGS system disk with the Chooser and other associated AppleTalk software that can use AppleWorks 3.0 on an Apple IIGS with a single 3.5 drive and networked ImageWriter II.

Here's what I need to know: What's the minimum ProDOS 8 system configuration that will allow this? Where do I get the required files, and how will I know if I've got the right versions?

DISCUSSION -----

Since the associated AppleTalk software is contained within GS/OS for the Apple IIGS computer, start by using the GS/OS Installer to make a GS/OS boot disk. Install the "AppleShare on a 3.5 Disk" script. Once this has installed successfully, select the "AppleShare" script (NOT the "AppleShare on a 3.5 Disk" again) and press the "Remove" button. After this step is finished, select the "AppleTalk ImageWriter" script and press the install button.

This disk will be the boot disk for providing access to the networked ImageWriter. Contained on this disk will be all the needed system files to run both GS/OS applications and ProDOS 8 applications. Chooser.II is not needed because the Graphic Control Panel will be used.

Once the Apple IIGS has booted to the Finder, use the Graphic Control Panel's AT ImageWriter CDEV to select the desired network ImageWriter. This will leave the selected printer stored in RAM for use by AppleTalk protocols. It will also write the selected printer into the CDEV's resource file for use on the next bootup. Thus, if the same printer is desired, it will not need to be selected again. Eject (with the drive button) the GS/OS boot disk, insert the AppleWorks disk, and double-click on the AppleWorks application icon. Be sure to specify the correct slot information about the printer within AppleWorks (slot 1 for 03 ROMs or slot 7 for 01 ROMs). AppleWorks will then work as

Clariss has designed it to work in a one-drive environment. When you exit AppleWorks, the system will return to the Finder.

If this operation is performed with the GS/OS 5.0.2 System.Disk and System.Tools, all the correct versions will be automatically installed.

## Macintosh Portable: Developer Issues on MIDI Support

Revised: 5/15/92  
Security: Everyone

Macintosh Portable: Developer Issues on MIDI Support

=====

Article Created: 14 June 1990  
Article Last Reviewed: 14 May 1992  
Article Last Updated: 14 May 1992

TOPIC -----

I was told there were some problems with MIDI software on the Macintosh Portable at introduction. What is the current status of this? What is Apple doing to fix the problems? What must a developer do?

DISCUSSION -----

The only change since introduction is that most developers have provided an update to their software or have begun using Apple's MIDI Manager, or both. There are two support issues to be aware of when using an older version of MIDI Manager (1.1) and the Macintosh Portable. Both issues relate to the implementation of the serial ports of the Macintosh Portable.

1) Version 1.1 of the MIDI Management Tools does not support the Macintosh Portable.

MIDI Management Tools version 1.1 required changes to work correctly with the serial ports of the Macintosh Portable. These changes were implemented in version 1.2 of the MIDI Management Tools.

2) Some older versions of third party MIDI applications will have difficulty with the Macintosh Portable.

Until the introduction of Apple's MIDI Manager, all MIDI software had to write to the serial port hardware directly, bypassing the Macintosh Toolbox, to obtain acceptable performance. Writing to the hardware is not an ideal procedure for developers; Apple changes things about the hardware from one Macintosh model to the next. This forced MIDI software developers to revise their programs every time a new Macintosh model was introduced.

With the changes in design of the Macintosh Portable, these direct hardware calls and Toolbox workarounds no longer perform as they would on earlier models of Macintosh. Fortunately, Apple resolved this issue by providing the MIDI Manager. If developers use the MIDI Manager, they will not need to revise their programs as a result of any serial port changes in future computers. MIDI Manager will be revised as needed to deal with changes in serial ports. With MIDI Manager 1.2 or later, applications supporting MIDI Management Tools work correctly on the Macintosh Portable.

Make sure to use the most current version of the MIDI Manager to ensure that a program will communicate successfully with the serial port, regardless of Macintosh model.

## Macintosh Display Cards Overview (3 of 3)

Revised: 7/16/90  
Security: Everyone

Macintosh Display Cards Overview (3 of 3)

=====

This article last reviewed: 19 March 1990

(This is a continuation of, "Macintosh Display Cards Overview (2 of 3)")

### - NuBus Block Transfer

One important display card acceleration feature is the NuBus block transfer function. Macintosh Display Card 8/24 GC supports both master and slave NuBus block transfer. Macintosh Display Card 4/8 and 8/24 support NuBus block transfers in slave mode only.

Most Macintosh systems do not support NuBus block transfer so this function is primarily a factor between NuBus cards with block transfer abilities. However, the Macintosh IIfx does support block transfers in slave mode only.

NuBus block transfer facilitates faster movement of data. Normally data is moved across NuBus in 32-bit words, 16-bit half-words, or bytes. Bus availability must be arbitrated between each word transferred. Under NuBus block transfer, the bus is arbitrated by the master, and then held while one address word and 16 data words are transferred to the addressed NuBus slave. Block transfer mode significantly accelerates the flow of data between the new display cards.

Because the Macintosh and many other NuBus cards lack NuBus block transfer support, another scheme is used to speed up data transfer between the Display Card 8/24 and other NuBus clients. Pseudo-block transfer is similar to block transfer in that it claims the bus for a 16 NuBus data word transaction; however, it must send an address word for each data word that it sends. The extra transfer activity makes pseudo-block transfer slower than block transfer but still an improvement over normal NuBus access times.

### - Multiple Display Cards in One System

When multiple display cards are installed, the Macintosh Display Card 8/24 GC accelerates drawing in frame buffers of the Macintosh Display Card 4/8, 8/24,

or other frame buffer cards. Display Cards 4/8 and 8/24 show the most improvement because they support slave NuBus block transfers and many other display cards do not. Acceleration for frame buffers other than the one resident on the Display Card 8/24 GC card would not be as dramatic because of the greater amount of NuBus traffic required. Only one 8/24 GC may be used for graphics acceleration in a system. If two cards are present, one will have its acceleration function disabled.

#### - Upgrades

The Macintosh Display Card 4/8 can be upgraded to Display Card 8/24 by using the Macintosh Display Card VRAM Kit.

The Macintosh Display Card 8/24 GC can be upgraded with the Macintosh Display Card DRAM Expansion Kit, which improves the performance of applications that use large off-screen bitmaps and other imaging methods.

#### System Software

System Software Version 6.0.5 or greater is required with Display Cards 4/8, 8/24 and 8/24 GC. Macintosh II, IIx, and IICx systems require the 32-bit QuickDraw patch file. Macintosh IICI and IIIfx systems have 32-bit QuickDraw in ROM and require only System 6.0.5 or greater.

#### System Requirements

To use the Macintosh Display Card 4/8, 8/24, or 8/24 GC you need:

- A modular Macintosh II personal computer with an available NuBus slot
- System Software Version 6.0.5 or greater
- For Macintosh II, IIX and IICx: the 32-bit QuickDraw software file is needed to run 24-bit color applications.
- To take advantage of full 24-bit color, a minimum of 2MB of memory is recommended.

#### Support Issues

- Cables For Current Portrait and Two-Page Display Customers

Current Portrait and Two-Page display customers must purchase a DB-15 to DB-25 adaptor when connecting any of the new display cards. Customers buying new Portrait and Two-Page displays will receive the proper cable.

- A/UX

The Display Card 8/24 GC will not initially work with A/UX. A/UX 2.0 compatibility is planned.

- Power Consumption

The Display Card 8/24 GC uses up to a maximum of 20 watts. In systems with all NuBus slots utilized, the power requirements of all cards installed should be added together to ensure that the NuBus power draw is not exceeded. Six-slot

Macintosh modulars provide 90 watts for nuBus, 3-slot Macintoshes provide 45 watts.

- Macintosh II ROMs

The original Mac II ROMs had several problems that will not allow the Display Cards to function properly. There is a service program in place that will replace the original ROMs with new ones.

#### Connector Pinouts

DB-15 Monitor Video Connector for Display Cards 4/8, 8/24 and 8/24 GC.

| Pin   | Signal      | Description          |
|-------|-------------|----------------------|
| 1     | RED.GND     | Red Video Ground     |
| 2     | RED.VID     | Red Video            |
| 3     | CSYNC~      | Composite Sync.      |
| 4     | MON.ID1     | Monitor ID, Bit 1    |
| 5     | GRN.VID     | Green Video          |
| 6     | GRN.GND     | Green Video Ground   |
| 7     | MON.ID2     | Monitor ID, Bit 2    |
| 8     | nc          | (No Connection)      |
| 9     | BLU.VID     | Blue Video           |
| 10    | MON.ID3     | Monitor ID, Bit 3    |
| 11    | C&VSYNC.GND | CSYNC & VSYNC Ground |
| 12    | VSYNC~      | Vertical Sync.       |
| 13    | BLU.GND     | Blue Video Ground    |
| 14    | HSYNC.GND   | HSYNC Ground         |
| 15    | HSYNC~      | Horizontal Sync.     |
| Shell | CHASSIS.GND | Chassis Ground       |

the Portrait and Two-Page Displays.

| DB-15 | Signal      | D-25        |
|-------|-------------|-------------|
| 1     | RED.GND     | A3 (Outer)  |
| 2     | RED.VID     | A3 (Center) |
| 3     | CSYNC~      | 5           |
| 4     | MON.ID1     | 9           |
| 5     | GRN.VID     | A2 (Center) |
| 6     | GRN.GND     | A2 (Outer)  |
| 7     | MON.ID2     | 8           |
| 8     | nc          |             |
| 9     | BLU.VID     | A1 (Center) |
| 10    | MON.ID3     | 3           |
| 11    | C&VSYNC.GND | 4, 7, 10    |
| 12    | VSYNC~      | 2           |
| 13    | BLU.GND     | A1 (Outer)  |
| 14    | HSYNC.GND   | 1           |
| 15    | HSYNC~      | 6           |
| Shell | CHASSIS.GND | Shell       |

## DAL: Client O.S. Runtime Environments

Revised: 8/11/92  
Security: Everyone

DAL: Client O.S. Runtime Environments

=====

Article Created: 9 August 1990  
Article Last Reviewed: 20 July 1992  
Article Last Updated: 30 July 1992

TOPIC -----

This article discusses DAL client operating system runtime environments.

DISCUSSION -----

Macintosh

-----

Data Access Language (DAL, formerly known as "CL/1") supports the Macintosh Operating System version 6.0.5 or later on all Macintosh hardware platforms with at least 2MB of RAM. The API is available in MPW C and Pascal object format, Think's Lightspeed C object format, and HyperCard XCMD/XFUNC format (embedded in DAL-HyperCard Help stack) for support of HyperCard 1.2 or later.

Host Servers

-----

DAL supports the VAX/VMS operating system across the VAX hardware platform. This server supports the following DBMSs:

- Oracle
- Sybase
- Informix
- Ingres
- Rdb

DAL Server for A/UX supports the following DBMSs:

- Oracle
- Informix
- Ingres

DAL Server for VM/CMS supports the SQL/DS DBMS on VM/CMS systems.

DAL Servers for MVS/TSO and MVS/VTAM support the DB2 and Teradata DBMSs on MVS/XA and MVS/ESA systems.

Network Adapters (Communication Drivers)

Asynchronous

DAL supports async communications for VAX and A/UX with appropriate supporting hardware.

AppleTalk (ADSP)

DAL supports the AppleTalk Data Stream Protocol (ADSP) on Macintosh client systems running the ADSP driver software over the built-in AppleTalk connection or EtherTalk supporting hardware to VMS host systems running the DAL Server and AppleTalk for VMS.

ADSP Tool

DAL supports the Comm Toolbox AppleTalk Tool to VMS hosts running the DAL Server and AppleTalk for VMS.

Async CTB

DAL supports the Comm Toolbox async tools to VAX and A/UX DAL Servers.

3270 Connections

DAL supports 3270 connections on Macintosh systems equipped with hardware that supports the following 3270 solutions:

Apple MacDFT 1.1 running on:

- Coax/Twinax Card
- TokenTalk Card
- Serial NuBus Card

Tri-Data - Netway 1000, Netway 2000 - uses the Tri-Data API

Avatar - MacMainFrame - uses the Avatar API

DCA - MacIRMA Card - uses the MacIRMA API

SNA•ps Gateways running on:

- Coax/Twinax Card
- TokenTalk Card
- SDLC Card

APPC Connections

SNA•ps APPC Gateways running on any of the above NuBus cards.

#### Protocol Converters

-----  
Asynchronous access to protocol converters (front-ending MVS or VM) that access VT100-type output.

## DAL: Overview and Goals

Revised: 6/30/92  
Security: Everyone

DAL: Overview and Goals

=====

Article Created: 16 July 1990  
Article Last Reviewed: 30 June 1992  
Article Last Updated:

### Overview

-----

Data Access Language (DAL, formerly known as "CL/1") is a host database access tool that provides a connectivity language and a set of supporting software components that link personal computer applications to host databases. The connectivity language conforms to the Structured Query Language (SQL) standard. DAL can be used to access host database data from the desktop, where it can be manipulated and presented using familiar personal computer applications. Host databases can only be relational in nature.

DAL provides uniform access to host database data across a wide range of host hardware platforms, operating systems, database management systems, and network connections. The role of DAL is to insulate the desktop application from these details and differences, allowing it to concentrate instead on providing better interaction between "personal" processing on the desktop and organizational computing on the host system.

### Goal of DAL

-----

The goal of DAL is to provide an open, standard, host database access language that enables plug and play connectivity between desktop applications and organizational data. That is, a desktop application using DAL should be able, "out of the box," to access database data on a DAL-supporting host system and make that information an integral part of the data available to the desktop application user.

DAL gives software developers access to a broad range of shared database data through a single programming effort. DAL provides communications as a built in part of the runtime environment in the form of network adapters (communication drivers), thereby relieving the programmer from the burdensome task of

communications programming. Because DAL lets packaged application software uniform access different host operating systems, database management systems (DBMSs), and networks, DAL lets software developers focus on integrating corporate data into their applications, rather than low-level networking and programming tasks.

Using DAL, the desktop application can describe a host data access request in a uniform, high-level way. The DAL server for the host system then carries out the request and returns the results to the desktop application. DAL provides automatic data translation when transferring data between the client and host systems. The language supports a set of standard data types which are used to represent all data manipulated by DAL programs. Data from a host data source is automatically mapped into these standard data types when data is accessed. Descriptions of the host data source are also expressed in terms of the standard DAL types.

## Fiber Distributed Data Interface (FDDI): Description (9/94)

Revised: 9/8/94  
Security: Everyone

Fiber Distributed Data Interface (FDDI): Description (9/94)

=====

Article Created: 21 June 1990  
Article Reviewed/Updated: 8 September 1994

TOPIC -----

What exactly is FDDI?

DISCUSSION -----

FDDI stands for Fiber Distributed Data Interface and is an American National Standards Institute (ANSI) standard. Their fiber optic LAN standard is for a token-passing, counter-rotating ring that sends data at 100MB per second.

The ANSI X3T.9 committee took IEEE 802.5's token-ring standard and optimized it for fiber. The services provided on an FDDI network are a superset of the services that 802.5 provides; in general, any software that runs over 802.5 should run over FDDI, only faster. This speed is at least six times greater than the three IEEE 802 LAN standards. Even though 802.3 (Ethernet), 802.4 (token bus and MAP), and 802.5 (token ring) all can be implemented with fiber, they do not take advantage of fiber's capacity.

A FDDI network counter-rotating ring means you have two fiber cables instead of one. Normally only one cable will carry data; the second is used when a cable fault occurs to the first. A station is either single attached (connected to a concentrator which is connected to the ring) or dual attached (connected to both fiber cables directly onto the ring). When two neighboring dual attached stations detect a fault, they bring up the secondary data path. Hence the need for every dual attachment device to have management capabilities built in. Dual attached concentrators are used to interface single attached nodes to the ring. Concentrators will have multiple ports to accommodate multiple single attached devices. Concentrators may also be single attached, but will always be on a link that is eventually connected to a dual attached concentrator attached to the ring. With concentrators, you can build a physical star topology offshoot to the ring network.

The maximum circumference of an FDDI network is 100 kilometers (or 200

kilometers if you count both rings), and supports up to 500 stations (1,000 physical connections to both rings). The maximum distance between two active nodes cannot exceed 2 kilometers, so unless all nodes are active all of the time, the FDDI network will probably be less than the 100-kilometer maximum.

Though the recommended transfer rate is 100MB per second, you could send data on both rings simultaneously for a 200MB transfer rate. Although the data rates on the FDDI ring remain constant when loaded, a station's access time to the network may decrease depending upon the station's priority. Sustained data transfer rates for a 100MB implementation is approximately 80MB per second, due to overhead bits, token passing times, and so on.

FDDI is implemented at the Data Link and Physical layers of the Open Systems Inconnection (OSI) seven-layer model. The basic fiber-optic link consists of an optical transmitter, optical receiver, fiber-optic cable, and optical connection.

The next generation of fiber-based high-speed LANs is already being looked into by the ANSI X3T9.5 committee. One that is upwardly compatible with FDDI, that adds voice and video capability, is FDDI-2. FDDI-2 specifies a time-division multiplex approach to divide the available network bandwidth between voice and data.

## Read/Write Optical Discs: Using for CD-ROM Emulation

Revised: 7/16/90  
Security: Everyone

Read/Write Optical Discs: Using for CD-ROM Emulation

=====

This article last reviewed: 21 June 1990

TOPIC -----

I have an optical disc with data stored on it. I am considering putting the data on a CD-ROM, but am unsure of the performance I will get in a CD environment.

If I use a write lock on the optical disc, would this be a suitable emulation of a CD-ROM? If not, what do I need to do in order to emulate the performance of a CD-ROM with the optical disk?

DISCUSSION -----

Using the optical disc in a write-lock mode is the best simulation of a CD-ROM that is available. However, note that some optical discs may have a slightly better performance than a CD-ROM.

Using the write-lock mode will help locate any possible write attempts prior to the pressing of the CD-ROM.

Most CD-ROM pressing facilities provide "one-off" CD-ROMs, which are actual CD-ROMs (but only one is created). This may be an additional expense, although the "one-off" provides an actual CD-ROM to see if all is correctly laid out. The "one-off" is created after using the data in the optical disc environment, prior to pressing the final CD-ROM.

## Data Modem 2400: Configuring for Credit Card Dialing

Revised: 7/16/90  
Security: Everyone

Data Modem 2400: Configuring for Credit Card Dialing

=====

This article last reviewed: 21 June 1990

TOPIC -----

I have a Macintosh Portable which is now equipped with an Apple Macintosh Portable Modem. When used to dial local numbers or when dialing direct, it works just like a Hayes modem is supposed to.

In my use of the Portable however, I often dial long distance numbers. My technique for doing this is to dial with a 0 (instead of a 1) and then dial my credit card number. On a normal Hayes modem, this is done as follows:

```
ATDT013012869000;
```

Notice the semicolon at the end of the dial string, which tells the modem to return to command mode when done with the phone number.

As the call is completed, AT&T will come around and ask for a credit card number. Since the modem is still in command mode, I give the following command:

```
ATDT1234567890
```

This command tells the modem to send my credit card number. After this, the call is typically completed and I can do my stuff.

The trouble with the Macintosh Portable modem is that when it is given the second command string, it hangs up the phone before doing the credit card number. This is not good. I need a solution.

DISCUSSION -----

Your problem is caused by a feature of the Macintosh Portable Data Modem 2400 and its use of the dial command. The feature in question is dial tone sensing -- waiting for a dial tone before actually dialing the requested number. It is

a common feature of many, but not all, Hayes and Hayes-compatible modems and actually originated with another modem manufacturer.

When you issue the first dial command, the modem goes off-hook, waits for a dial tone, and then dials the number. After the second dial command, the modem (which is already off-hook) again waits for a dial tone. Since there is no dial tone present at this stage of a credit card call, the modem waits 2 seconds as specified by modem register S6 and goes on-hook without dialing the credit card number. It should also alert the user with a NO DIALTONE message.

There are a couple of ways to get around the problem. The first and probably most acceptable way is to use additional dial command options designed just for this kind of situation.

The W modifier can be put in the middle of a dial string to cause the modem to wait for a "secondary" dial tone such as that generated by AT&T "dial 0 first" calls.

```
ATTD 0 123 456-7890 W 12345678901234
```

The above command dials the destination number, and then pauses at the W for a secondary dial tone. When the secondary dial tone is detected, the rest of the number is dialed -- in this case, the credit card number. The number of seconds the modem will wait for the secondary dial tone is controlled by the value of modem register S7.

Some long distance services do not generate this secondary dial tone, and in these cases a different modifier must be used. The @ symbol causes the modem to wait for a 5-second silence before continuing, and is one alternative.

```
ATDT 0 123 456-7890 @ 12345678901234
```

This dials the destination number and then waits for a 5-second silence before dialing the credit card number. If the 5-second silence isn't detected within the number of seconds in modem register S7, the modem will go on-hook and display the message NO ANSWER.

Another useful modifier is the comma character. It will generate 2-second pauses (controlled by modem register S8) while dialing. Two in a row would cause a 4-second pause.

```
ATDT 0 123 456-7890 ,, 12345678901234
```

This dials the destination part of the number and pauses 4 seconds before dialing the credit card number.

The 5-second delay usually works, but is often excessive. Combinations of commas can generate just the right amount of delay, depending on the long distance carrier being used.

One last item to note is that the dial tone sensing is only active when result code set 2 or 4 is used. This is controlled by the ATXn command, where n is a value from 0 to 4 inclusive. If 0, 1, or 3 is used, your original method of

dialing would work.

## ALERT: Steroid Trojan Horse

Revised: 7/16/90  
Security: Everyone

ALERT: "Steroid" Trojan Horse

=====

This article last reviewed: 21 June 1990

TOPIC -----

This article discusses the effects of a Trojan Horse called "Steroid", and some suggestions on repairing the losses it can cause.

DISCUSSION -----

The Trojan Horse called "Steroid" is an INIT that claims to speed up QuickDraw on Macintosh computers with 9-inch screens. The INIT contains code that checks for the date being greater than June 6, 1990. If it is, it erases all mounted drives.

We have performed some tests on a Macintosh SE. Having Comm Toolbox installed seemed to interfere with the INIT and kept the erase from happening: the Macintosh SE simply crashed instead.

We then installed the INIT on a floppy disk and booted the Macintosh SE. The floppy and hard disk were promptly erased. NOTE: We had set the date to one LATER than June 6, 1990.

So far, we know that the code does the following operations at restart:

Operations at Restart

-----

DATE & TIME CHECK (Loop)  
SYSENVIRONS CHECK  
GETS VOLUME INFORMATION (probably checking for HFS)  
GETS SOME ADDRESSES (Toolbox traps)  
DOES SOME HFS DISPATCH OPERATIONS  
VOLUME IS REINITIALIZED to "Untitled"

Information

-----

TYPE: INIT  
CREATOR: qdac  
CODE SIZE: 1080  
DATA SIZE: 267  
ID: 148  
Name: QuickDraw Accelerator  
File Name: " Steroid" (first two characters are ASCII 1)

What To Do

-----

If your disk becomes erased, you can use SUM II Disk Clinic to recover the deleted files. We have tried this and it seems to work.

## AppleShare 2.0 & Older Versions: Recommended Memory Use (8/95)

Revised: 8/22/95  
Security: Everyone

AppleShare 2.0 & Older Versions: Recommended Memory Use (8/95)

=====

Article Created: 21 June 1990  
Article Reviewed/Updated: 21 August 1995

TOPIC -----

Extra memory in an AppleShare file server is automatically given to RAM cache. But because of the algorithms used by Macintosh RAM cache, some have told me that a 2MB server is actually FASTER than a 5MB server.

Is this the case? Are there any recommendations for memory size for:

File Server Only  
File Server and Print Server  
File Server with Internet Router  
File Server and Print Server with Internet Router

If I'm using a Macintosh II as a file server with 2MB of memory (and under the maximum of 50 users) what's the benefit of another 3MB of memory for the file server? I know that the RAM cache will increase (it's at 1024K already, though with 2MB) and that will (theoretically) speed things up, but I've switched back and forth, and don't see much of a difference.

DISCUSSION -----

AppleShare File Server runs in about 1MB of RAM. Any memory beyond this 1MB is given to RAM cache, to cache directory structures, user data files, and so on. Thus, in a 2MB machine, 1MB will be used for caching. As cache size increases, more of the disk directory can be maintained in memory. This results in fewer disk accesses and faster response. Users' data files are also maintained in cache when there is room. This is effective with multi-user applications when several users access the same data file.

In general, 1MB of cache memory is quite adequate. Any more memory beyond this will not buy you much -- and can degrade performance, as you were told. This is why you did not see the difference between a 3MB and a 5MB machine.

For a File Server only, 1MB to 2MB memory is recommended. A 1MB Macintosh server can support 25 concurrent users. A 2MB Macintosh II can support 50 concurrent users.

To run the AppleShare File Server with the Internet Router or the AppleShare Print Server, or both, the minimum memory requirement is 2MB. You should run about 4MB to achieve better performance.

For more information about memory requirement when running the Internet Router with the File Server and the AppleShare Print Server, search the Tech Info Library using keywords "Internet Router" and "memory".

## MacDFT: IBM Environment Printing Support

Revised: 7/16/90  
Security: Everyone

MacDFT: IBM Environment Printing Support

=====

This article last reviewed: 21 June 1990

TOPIC -----

DCA MacIrma supports printing with the IBM standard \$IND file transfer mechanism.

MacDFT doesn't seem to support that function. Why?

DISCUSSION -----

We are not clear how you are using file transfer service IND\$ for printing. DCA MacIrma supports printing via LU Type 3 devices to IRMAPrint attached printers. Tri-Data Systems, Inc.'s Netway supports printing via LU Type 3 device to LAN-based LaserWriters.

In the IBM environment, Local copy means sending a snapshot of your screen to the control unit, which prints it on a 3287 printer. Host Local copy printing means printing a host file on a 3287 printer connected to the terminal. MacDFT version 1.1 does not support host or terminal local copy. However, you can create a screen image that you can save to disk or print from the Macintosh II computer during a MacDFT session.

You can print documents and files produced during your MacDFT session on an Apple printer that is connected to your Macintosh. You can print host-resident documents to an IBM printer that is connected to your control unit or host. Use the print commands that are supported in your IBM environment.

## Macintosh: Controlling Multimedia Peripheral Devices

Revised: 12/22/95  
Security: Everyone

Macintosh: Controlling Multimedia Peripheral Devices

=====

Article Created: 16 July 1990  
Article Reviewed/Updated: 22 December 1995

TOPIC -----

- 1) Is there any product available that allows peripherals like the video cassette recorder, LaserDisc player, large screen projector, slide projector, sound system, lighting system, and so on, to be controlled from the Macintosh? How about a product that can control the VCR and get it to go to certain frames on the video cassette (just like the way the Macintosh can control the LaserDisc player).
- 2) Are there any products around that can record the Macintosh screen display into PAL video format?

DISCUSSION -----

- 1) We do not know of one commercial product that can control all of the listed peripherals. However, there are products for controlling most of the individual peripherals separately.
  - VCRs, camcorders and still video cameras with Control-L (Sony's video control standard) can be controlled via VidClip XCMDs for HyperCard, which are available from APDA. At this point, it appears that only Sony equipment uses the Control-L protocol. Sony does have 8mm VCRs, VHS VCRs, and still video cameras/players that support the Control-L protocol.
  - There are XCMDs for HyperCard that can control many of the laser disc players. These XCMDs are available from Voyager.
  - Sound systems and lighting systems can be controlled via MIDI. Audio mixing boards, audio equalizers, audio delay and reverb devices, and lighting control boards exist that have MIDI connections built in. A visit to a professional musicians' store should provide an array of possibilities for MIDI-controlled sound and lighting systems.

- Slide projectors usually have a cable-attached button controller for advancing/reversing slides. These button controllers can be replaced with a MIDI-controlled device from Peavey Electronics. Peavey is a music instrument manufacturer that recently produced a line of MIDI-controlled devices for controlling various items used in live performance music. One of these devices can replace the slide projector's remote control. Again, a professional musicians' store that carries Peavey products can supply this device.
- VidClip provides the control access to go to certain locations on tape. However, going to a specific frame on tape is not as easy as on disc. It is possible to get within about 5 frames with the typical Control-L VCR. Since recording single frames on low- to moderate-cost VCRs is not possible, the usual expectation with VCRs is to get close to (and in front of) the beginning of a video segment, start the playback, finish the segment, and stop the playback. Then cue to the next segment and continue.
- In addition to the list of media devices you have, audio CDs can also be controlled from HyperCard XCMDs. This would allow the addition of CD quality music and/or speech from audio CDs to the presentation. (Please be sure to check copyright issues when using material with copyrights.)

There are a variety of ways to integrate all of these various controllers into one application on the Macintosh. HyperCard XCMDs exist for the VCRs, laser discs, and for MIDI. Using a HyperCard stack that has access to all of the XCMDs would be able to control all of the devices at the click of a HyperCard button.

MacroMind Director 2.0 can use XCMDs from HyperCard, as well as its own XObjects. Thus, you can control the list of devices from within a Director movie, much like you would from within a HyperCard stack.

- 2) Many of the video boards can send Macintosh images to videotape in the PAL format. Truevision NuVista cards, several RasterOps Cards, and Mass Microsystems cards are all capable of providing PAL output. Some of these cards require an external encoder box to provide the PAL connection. Please check with the manufacturer for exact configurations. The Display Cards 8/24 and 8/24 GC will be able to provide PAL output via Truevision's VIDI/O Box. Eventually, RasterOps will have a PAL version of their Video Extender that will provide PAL.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

## Novell Netware: AARP Packet Size Error Fix Available

Revised: 7/16/90  
Security: Everyone

Novell Netware: AARP Packet Size Error Fix Available

=====

This article last reviewed: 21 June 1990

TOPIC -----

I am running AlisaShare and, on another part of the network, Novell File Servers with Netware 2.15c and the Mac VAP 1.1.

The problem is with the AARP packet size that the Novell file servers are sending. AlisaShare is reporting an AARP packet size error.

I have checked out the AARP packet sizes with a sniffer. AlisaShare thinks the only valid AARP size is 60 bytes. Netware is sending AARPs that are 74 bytes in size. The old versions of Netware (2.15a with Mac VAP 1.0) send ARPs with a packet size of 60 bytes. They work fine with AlisaShare.

DISCUSSION -----

There is a maintenance release of Netware for the Macintosh specifically designed to resolve the AARP packet length problem. You can get it by calling Novell Tech Support and asking for maintenance release 1.11 of Netware for the Macintosh.

For more information, search under: "Novell"

## AppleShare Print Server: How To Speed Up Lino L300 Spooling

Revised: 7/16/90  
Security: Everyone

AppleShare Print Server: How To Speed Up Lino L300 Spooling

=====

This article last reviewed: 21 June 1990

TOPIC -----

This article discusses solutions for slow spooling and printing from a Macintosh to a Linotronic L300.

DISCUSSION -----

We ran into a SEVERE slowdown using the Print Server on a dedicated Macintosh SE with 2.5MB that was spooling to a Linotronic L300. 700K files were taking up to seven minutes to spool.

The first step was to take the two high-end output workstations and link them to the Rip 4s via Ethernet, using the 5.2 Laser Prep and so on. The same print job now took 1 minute 40 seconds to the Print Server, and 1 minute 30 seconds direct to the Rip.

Laser Prep & Laser 6.0 are the only drivers that are able to take advantage of font caching. So we installed 6.0 on the Print Server and Workstations.

Printing to the AppleShare print server then dropped to 40 seconds.

## DayStar FastCache: Incompatible with Apple Tape Backup

Revised: 7/16/90  
Security: Everyone

DayStar FastCache: Incompatible with Apple Tape Backup

=====

This article last reviewed: 21 June 1990

TOPIC -----

Apple Tape Backup 2.0.1 crashes when running on my Macintosh IIci whenever a DayStar Digital FastCache card is physically installed in the Macintosh.

DISCUSSION -----

DayStar Digital confirmed that Apple Tape Backup does not run with cache turned on. The only current workaround (June, 1990) is to turn the cache off when running Tape Backup.

Please note that removing the DayStar FastCache Macintosh IIci CDEV will not turn cache off, since it is controlled in ROM. The correct way is to leave the DayStar CDEV in the System Folder, choose Control Panel from the Apple menu, click the DayStar FastCache Macintosh IIci CDEV, and turn the cache off.

## LaserWriter IINTX: ROMs Are v3.0 as of June, 1990

Revised: 7/16/90  
Security: Everyone

LaserWriter IINTX: ROMs Are v3.0 as of June, 1990

=====

This article last reviewed: 2 July 1990

TOPIC -----

Have the LaserWriter IINTX ROMs been updated to allow software switching back from LaserJet to PostScript? My LaserWriter IINTX manual says you can get the software to switch back, but I am unable to make it work.

DISCUSSION -----

LaserWriter IINTXs (controller board Apple part #M6004/A) are currently shipping with version 3.0 ROMs. The major differences between these and older ROMs are:

- Software switching from LaserJet emulation to PostScript
- Font cleanup in LaserJet emulation
- Better disk management routines
- PostScript 51.8.

The upgrade kit (Apple part #M0445LL/A) is expected to ship (in very small numbers) in the third week of June.

Support Readiness will send upgrade kits (including the new manual) on a one-per-site basis as soon as they are available.

## LaserWriter IINTX: Use Font Utility 2.0 with Rev 3.0 ROMs

Revised: 7/16/90  
Security: Everyone

LaserWriter IINTX: Use Font Utility 2.0 with Rev 3.0 ROMs

=====

This article last reviewed: 2 July 1990

TOPIC -----

System: LaserWriter IINTX with Rev 3.0 ROMs (PostScript Version 51.8) and 20MB hard drive attached to SCSI port. Apple LaserWriter Font Utility Version 1.0/ System Software 6.0.5

Problem  
-----

When using the Apple Font Utility to download fonts, I downloaded some fonts, stopped and then restarted the process again in the morning. The Apple Font Utility did not show any fonts previously downloaded as appearing on the hard drive. The start-up test page does show that there were 46 fonts available. The Adobe Font Utility also lists all of the available fonts. Only the Apple Font Utility doesn't show them.

I then installed another font and it showed as being there, but none of the others did (this was done without quitting the Apple Font Utility). After quitting the Apple Font Utility and restarting, the fonts don't show. Adobe's utility does show the additional font, as does the startup page.

The fonts do print correctly and the LaserWriter goes to the hard drive and gets the fonts as needed; that is, they DO NOT get downloaded over LocalTalk.

Is there a problem with the Apple LaserWriter Font Utility Version 1.0 and the new LaserWriter IINTX board? Is there a problem with the 1.0 Font Utility and System Software 6.0.5?

DISCUSSION -----

A new version of the LaserWriter Font Utility ships with the new LaserWriter IINTX board. If you have the new board, you should be using version 2.0 of the LaserWriter Font Utility.

## MacDFT 1.1: Configuring in NON-SNA Mode

Revised: 7/16/90  
Security: Everyone

MacDFT 1.1: Configuring in NON-SNA Mode

=====

This article last reviewed: 2 July 1990

TOPIC -----

I have a problem configuring MacDFT 1.1 for NON-SNA.

Configuration

-----

MacDFT 1.1  
Coax/Twinax NB Card  
Cluster Controller 3274 61C - configured for DFT  
modem to an IBM host

I tried to configure MacDFT 1.1 for NON-SNA. During the startup of MacDFT an error window opened and told me to re-configure MacDFT to SNA-mode because NON-SNA was not a valid configuration. Then I tried to configure MacDFT for SNA and the same error message told me to configure MacDFT to NON-SNA.

Why can't I configure MacDFT 1.1 for NON-SNA?

DISCUSSION -----

It looks like your cluster controller is configured for Bisynchronous communications. If this is the case, MacDFT can provide CUT support only over Bisynchronous, so switching the coax CDEV setting to CUT mode should work.

The significance of the "DFT (NON-SNA)" setting is to support non-SNA channel protocols for locally attached controllers such as the old 41D models. Since your 61C is designed for remote connections, it isn't prepared to handle channel protocols, and MacDFT notifies you of the conflict.

If you're not trying to maintain Bisynchronous communications, and SDLC communications are OK, then you will need to check your controller's customization; if it is set for Bisynchronous, you will need to change it to SDLC in order for MacDFT to provide full DFT capabilities. The attach option

is configured in customization question 101 on the "Model/Attach" panel of the customization utility (see the 3174 customization manual for further reference).

## Macintosh: 24-bit Image Copying Problem Caused By Heap Space

Revised: 7/16/90  
Security: Everyone

Macintosh: 24-bit Image Copying Problem Caused By Heap Space

=====

This article last reviewed: 5 July 1990

TOPIC -----

I'm having trouble copying and pasting between Microsoft PowerPoint and Solutions International's SmartScrap. I tried to copy several 24-bit images from the PowerPoint document (they occupy a total of about 2.5MB), but when I tried to paste them, the first couple pasted OK but the rest didn't, and the machine hung.

DISCUSSION -----

We solved the problem by increasing the system heap space.

Normally the system has a small amount of heap space available. We increased the space using CE Software's Heapfixer, and all the problems went away.

We also checked with both Solutions International and Microsoft, and neither was aware of any other conflicts.

Microsoft, however, strongly recommends that anyone using 24-bit graphics in PowerPoint upgrade to version 2.0.1d.

For more information, search under: "CE Software"

## Macintosh Display Card 8/24: NTSC Video Encoding

Revised: 6/18/92  
Security: Everyone

Macintosh Display Card 8/24: NTSC Video Encoding

=====

Article Created: 5 July 1990  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

TOPIC -----

I am very interested in getting a decent video signal from Macintosh II systems. I'm interested in Apple's Display Card 8•24 because of the convolution filter that (as far as I know) has no equivalent in third-party products.

Will the Display Card 8•24 ship with a CDEV like the Macintosh II video card utility to step the board down to interlaced NTSC scan rates? If not, how can I get such a utility/application?

Currently, I'm using a Truevision VIDIO/O box to do the RGB encoding. Has anyone tried the Truevision product with the Display Card 8/24?

DISCUSSION -----

The Display Cards 8•24 and 8•24 GC do not use software for switching to the NTSC interlaced mode. To put the Display Card 8•24 GC into the NTSC mode, a properly configured cable is all that is required. For more information, search under "NTSC output without converter".

To acquire a color NTSC signal from any Apple Macintosh display card, an RGB-to-NTSC converter will be required.

RasterOps and Truevision both have RGB-to-NTSC converters. RasterOps' Video Expander and Truevision's VIDIO/O Box accept the RS-170-A output of the Display Card 8/24 and 8/24 GC and generate a full color NTSC interlaced video signal. Both of these interface boxes also provide S-Video (also known as Y/C component video) output via the standard 4-pin mini-DIN connector. S-Video connections are used by S-VHS, HiBand 8mm, and ED Beta video devices.

Another device for RGB-to-NTSC conversion is ComputerVideo's Video NTSC Encoder. This was designed for the older Macintosh video card; however, it should work with the new display cards when the correct cable is used (see above).

For cable requirements for these interface devices, please check with the appropriate interface manufacturer.

For 8-bit video, Apple's convolution provides one of the finest methods for eliminating the single-pixel flicker that NTSC produces. When using 24-bit color, a different approach is required to address the NTSC flicker issue, since Apple convolution works only to the 8-bit level. Scan converters, like RGB/Videolink 600A, have been used for many years in the professional computer graphics companies to address NTSC flicker.

Scan converters would be used for television broadcast-quality 24-bit images. Scan converters not only convert the RGB signal to NTSC, they also eliminate the flicker associated with horizontal single-pixel lines and provide aspect-ratio conversion, color-bar generation, video transitions, freeze frame, and video mixing.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## Display Card 8/24: RS-170 External Sync

Revised: 7/16/90  
Security: Everyone

Display Card 8/24: RS-170 External Sync

=====

This article last reviewed: 5 July 1990

TOPIC -----

Do the Apple Display Cards 8/24 and 8/24 GC accept an external sync signal when in RS-170 mode? How is RS-170 external sync mode enabled?

DISCUSSION -----

The video cards alone do not except external sync -- however, if the video cards are being used in an environment where external sync is an issue, an RGB-to-NTSC converter is very likely in use. Truevision's VIDI/O Box and RasterOps' Video Expander can be used with either video card to allow external sync ability.

The specifics of using external sync are provided in each converter manufacturer's documentation.

At announcement, many references were made to the Display Card 8/24 being RS-170. In actuality, the production video cards meet the full RS-170-A specifications -- RS-170 being the original black and white specification; RS-170-A is the color extension to the original specification.

Without one of the above converters, the interlaced signal coming from the Display Card 8/24 and 8/24 GC will still be in black and white. With one of the converters, the Display Card 8/24 and 8/24 GC will provide full RS-170-A color.

## Why Apple Computers Make Rounding Errors

Revised: 6/15/92  
Security: Everyone

Why Apple Computers Make "Rounding Errors"

Article Created: 5 July 1990  
Article Last Reviewed: 22 May 1992  
Article Last Updated:

TOPIC -----

I'm having trouble doing a simple math calculation with FileMaker II. All subsequent programs I tried produced the same mathematical "error" (Excel and the Calculator desk accessory are a couple).

The calculation is very simple:

$$1194.6 - 500 - 640 - 54.6 = X$$

The result should be 0; however, all software produced the result -2.428612866E-17.

I can cure this problem in FileMaker II by rounding the result to two decimal places, but I am very interested in why the result does not go to zero. My IBM PC produced the same result. I gather the answer lies in the way personal computers handle subtraction.

DISCUSSION -----

The rounding errors you have run into on the Macintosh and IBM PC have been around since the beginning of personal computers (and longer!).

Computers must convert from a floating point decimal number to binary in order for the CPU to do math operations. To make the conversion process perform at a user-tolerable rate, past computer designers came up with "short cut" processes to do the conversion. These short cuts cause slight rounding errors. In the example you describe, the error is .00000000000000002486.... This can be annoying, but is a good trade-off for the amount of time that is saved when doing math functions.

## Installer Software: Where to Find Documentation (11/94)

Revised: 11/7/94  
Security: Everyone

Installer Software: Where to Find Documentation (11/94)

=====

Article Created: 16 July 1990  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I'm interested in creating an install program (perhaps in C or Pascal) that will automatically install software and utilities on Macintosh systems.

Is there an easy way to write installer scripts for applications? It is becoming more time-consuming, as my Macintosh network has expanded, to update software on every machine.

Is there a way to produce installer scripts similar to what Apple offers with the operating system software -- without getting into Macintosh programming?

DISCUSSION -----

You can use Apple's Installer software. Documentation on the software and its scripts is available on AppleLink. Use the following path to find it:

Developer Support  
  Developer Services  
    Tool Chest  
      Developer Utilities  
        Installer 3.4  
          Installer.sit (StuffIt) 5/93

## PrintMonitor: LaserWriter Timeout Messages

Revised: 12/16/91  
Security: Everyone

PrintMonitor: LaserWriter Timeout Messages

=====

Article Created: 5 July 1990  
Article Last Reviewed: 2 February 1991  
Article Last Updated:

TOPIC -----

If a few users are on the same network sharing a LaserWriter and one of them has sent a print job of many (say 100) pages to the LaserWriter, then the others have to wait for that job to be finished to capture the LaserWriter for their print job.

If they work under MultiFinder, and background printing has been activated in the Chooser, during the large print job, the print jobs of others will be spooled to their local disks without being canceled because of a timeout error.

Perhaps you can tell me if PrintMonitor has its own timeout mechanism and if so, is it possible to alter the timeout values by patching some code/resource?

DISCUSSION -----

PrintMonitor returns the message in question after the LaserWriter returns a timeout error. We occupied a system for over two hours, and, after releasing it, PrintMonitor printed the file that had been spooled.

If you are seeing excessive timeout errors, we suggest changing the timeout limits. To do this, see the Tech Info Library article, "LaserWriter: How to Change the Manual Timeout".

## RMS and DATATRIEVE: Macintosh File Access

Revised: 8/28/90  
Security: Everyone

RMS and DATATRIEVE: Macintosh File Access

=====  
This article last reviewed: 9 August 1990

TOPIC -----

Are you aware of a product for the Macintosh that allows direct access to RMS flat files? I am looking for programs that also support DATATRIEVE.

Also, is DATATRIEVE -- which was supported under CDD (Common Data Dictionary) -- supported under CDD+?

DISCUSSION -----

1) We are not aware of a product for the Macintosh that provides an interface to a flat file system such as RMS. Although the capability does exist in the Data Access Language (formerly CL/1) architecture, it would require development efforts on the host, since no such host services have been developed to our knowledge.

One option would be to develop your own environment on the host using MacWorkStation. Since the interface to the RMS file system is provided through VMS run time libraries, you could write a MacWorkStation application that accessed those libraries and presented them on the Macintosh. However, this would restrict the presentation on the Macintosh to MacWorkStation, and you would have to use Copy and Paste to transfer the information to other applications.

2) We are not aware of any product for the Macintosh that supports VAX DATATRIEVE. Please note the VAX DATATRIEVE is a query and report system and is a uniform access method for data stored by RMS, VAX Rdb, and VAX DBMS files; it does not have its own file architecture. Programmable softkeys such as ones provided by PacerLink can be used to program DATATRIEVE commands. If you are looking for products to access RMS files, then the answer is the same as in (1) above.

3) According to DEC's Pre-purchase Technical Assistance, VAX DATATRIEVE

version 5.0 will work with VAX Common Data Dictionary/Plus (VAX CDD/Plus version 4.2) and VAX CDD as long as you run VAX/VMS 5.2 or 5.3.

## Apple II: Transferring Data to the Macintosh

Revised: 7/16/90  
Security: Everyone

Apple II: Transferring Data to the Macintosh

=====

This article last reviewed: 23 June 1990

TOPIC -----

Can the Apple 5.25 PC Drive (and card) read ProDOS 5.25-inch disks under AFE?

DISCUSSION -----

Apple 5.25 PC Drive only supports disks that are formatted using the MFM encoding methods. Therefore, it does not read ProDOS-formatted disks, which use GCR. Alternative ways to move data from the Apple II to the Macintosh include AppleShare, a serial link (cable and/or modem), and by first moving the ProDOS data to 3.5-inch disks, which any Macintosh will mount.

You may find the AFE Works-Works translator helpful when actually translating the files. It is on the InfoSource CD-ROM available from Apple.

## PostScript Fonts: How to Determine ASCII Assignments

Revised: 12/11/92  
Security: Everyone

PostScript Fonts: How to Determine ASCII Assignments

=====

Article Created: 17 July 1990

### Article Change History

-----

12/1/92 - REVISED

- To consolidate the method for using this program.

### TOPIC -----

Users with typesetting equipment and LaserWriters have run into the problem that the fonts generated by the LaserWriter are not quite the same as those from the typesetter being used. This is causing some problems when documents are printed on machines other than the LaserWriter.

This article describes a method for determining the ASCII assignment of any font.

### DISCUSSION -----

By sending a PostScript program (listed below) to a LaserWriter, a user can determine which character is encoded to what ASCII assignment for any laser font. For example, this specific program gives all ASCII codes and their respective characters for the Times-Roman font. By changing the name of the font, where noted with the % and comment, the ASCII assignment and character can be determined for any laser font.

```
/Times-Roman findfont
[12 0 0 -12 0 0] makefont setfont
60 47 moveto
(ASCII Code - Character      Times-Roman) show  %Change the font name
here.
60 59 moveto
```

```
500 59 lineto
500 762 lineto
60 762 lineto
60 59 lineto
stroke
/Times-Roman findfont           %Also, change the font name
here.
[12 0 0 -12 0 0] makefont setfont
/char 1 string def
/nstr 3 string def /newline
{ currentpoint 14 add
exch pop LM
exch moveto } def
/prt-n
{nstr cvs show} def
/prtchar
{ char 0
3 -1 roll put
char show } def
/PrintCodeandChar
{ dup prt-n
( - ) show
prtchar newline } def
/LM 72 def
LM 72 moveto
0 1 49 {PrintCodeandChar} for
/LM 144 def
LM 72 moveto
50 1 99 {PrintCodeandChar} for
/LM 216 def
LM 72 moveto
100 1 149 {PrintCodeandChar} for
/LM 288 def
LM 72 moveto
150 1 199 {PrintCodeandChar} for
/LM 360 def
LM 72 moveto
200 1 249 {PrintCodeandChar} for
/LM 432 def
LM 72 moveto
250 1 255 {PrintCodeandChar} for
showpage
```

This PostScript program can be sent to the LaserWriter with the LaserWriter Utility that can be located on the LaserWriter Utility Disk. Put the text of this program into a text file (you can use TeachText) and send it to the printer with the LaserWriter Utility.

For additional information on PostScript, refer to the Adobe PostScript Language Reference Manual, 2nd Edition, by Adobe Systems, Inc.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## Apple IIe: Printing to Networked Printers

Revised: 7/16/90  
Security: Everyone

Apple IIe: Printing to Networked Printers

=====

This article last reviewed: 15 June 1990

TOPIC -----

I have an Apple IIe network problem. I have a printer network only with no file server. The school district wants to use the printer network with its 5.25-inch disk drives. There are about 50 labs with 20 to 25 Apple IIe systems in each lab.

I created a Chooser and Menu program "startup disk". I copied the necessary files and ATINIT to let the startup disk auto-select the networked printers. We found a public-domain menu program that requires only 1.5K. This lets the Chooser be part of the menu and lets teachers and students (especially K-3) select program without using pathnames.

I understand the AppleTalk network process and the need for the 3.5-inch drive. However, why can't we also provide support for the Apple IIe and the 5.25-inch drives?

DISCUSSION -----

The only issue with using 5.25-inch drives for the described environment concerns disk space. After adding ProDOS 8, Chooser.II (with associated files), and ATINIT, the remaining space is all that is available for applications and data files on the startup disk. This means that there is approximately only 60K available for applications on a disk configured with the needed resources for network printing.

For a printer choice to be retained, you need run Chooser.II only once, as long as the selected printer maintains the same name and stays available on the network. The selected printer is stored in the ATINIT file of the disk that contains Chooser.II. On subsequent startups with that disk, the printer that was previously selected becomes the default printer. Thus, Chooser.II is not required to be run every session.

If only one 5.25-inch drive is available and if applications and/or data files larger than 60K are to be used, it is possible to start up with the disk described above, then switch (without restarting) to a second disk containing the larger application or data file. We do not know of any menu programs that can launch an application on a second disk, although such a program would not be difficult for an Apple II programmer to write.

However, since Chooser.II needs to run only once (unless something about the printer changes), alternate methods of launching an application from the second disk can be considered. One example would be an Applesoft program that launched the menu program. By giving the Applesoft program a simple name (like MENU) and placing it in the main directory, the students would be able to switch disks, type RUN MENU, and then select the application desired.

## LaserWriter IINTX: Setting Baud Rate to 19.2Kb

Revised: 7/16/90  
Security: Everyone

LaserWriter IINTX: Setting Baud Rate to 19.2Kb

=====

This article last reviewed: 18 June 1990

TOPIC -----

I have a LaserWriter IINTX on an Apollo workstation network. Initially, I direct-connected (9600 baud) the LaserWriter to a print server to download the PostScript file that sets the printer to 19.2K baud.

Is a hardware setting available for this 19.2K baud setting, perhaps a jumper inside the LaserWriter IINTX or switch settings? This would eliminate the need to download the file.

DISCUSSION -----

The only way to set the baud rate of the LaserWriter IINTX to 19.2K baud is by sending a PostScript program to the LaserWriter. For reference, here is the PostScript program:

```
serverdict begin 0 exitserver
statusdict begin 25 19200 64 setsccbatch
```

For a more detailed description of this program and the options it can change, see page 122 of the "LaserWriter IINT/NTX Owner's Guide."

## Macintosh SE: Models After July 1988 Can Take DIP SIMMs

Revised: 7/16/90  
Security: Everyone

Macintosh SE: Models After July 1988 Can Take DIP SIMMs

=====

This article last reviewed: 26 June 1990

TOPIC -----

Concerning the Macintosh SE, are we using (or have we ever used) DIP SIMMs? I was wondering if there might be a physical interference problem with some Ethernet cards if this were the case.

DISCUSSION -----

Originally, Apple did not use DIP SIMMs in the Macintosh SE, because they did not fit. However, in July 1988, we revised our SIMM strategy for the Macintosh SE and began shipping the DIP SIMMs with the Macintosh SE. The Macintosh SE logic board was revised, and a jumper added that lets you put DIP SIMMs in banks 3 and 4 (the two frontmost banks), and still have room to install an option board.

This information is documented in the "Technical Procedures" manuals and in a service notice sent to Apple dealers in July 1988.

## Macintosh: RGB-To-NTSC Video Conversion Options

Revised: 6/17/91  
Security: Everyone

Macintosh: RGB-To-NTSC Video Conversion Options

=====

Article Created: 18 June 1990  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I work at a TV station and am researching the best solution for recording 24-bit images from my Macintosh IICx to videotape. I am interested in the Display Card 8/24 GC as a solution.

I have also considered the RasterOps 364 board that lets the Macintosh display real-time, 24-bit images on the Macintosh monitor from a video source. However, I do not know if this card offers the ability to record Macintosh video onto tape.

I am aware that the cards from Orange Micro, TrueVision, and Mass Micro may also be solutions. However I am not familiar with these cards and their features. If you can provide me with any info (or an opinion) I would appreciate it.

DISCUSSION -----

There are three approaches to placing Macintosh images into the NTSC world:

- A video card with onboard NTSC output. RasterOps, SuperMac, Orange Micro, Computer Friends, Mass Micro, and others make Macintosh video cards that provide NTSC output directly from the cards.
- An RGB-to-NTSC converter box. RasterOps and ComputerVideo make RGB-to-NTSC converter boxes that work with Apple's color video cards, both the new ones and the original 8-bit video cards. RasterOps' converter also works with their 208, 264, 364, and 16PC cards. TrueVision also provides a RGB-to-NTSC converter box for their video cards. However, it does not work with the Apple video cards.

- A scan converter. RGB Spectrum builds a scan converter that works with most Macintosh 640x480 video cards.

The card providing onboard NTSC output must have all the necessary circuitry built on the NuBus video card. These are the simplest to install and use. There are connections on the cards for connecting the NTSC video signal coming from the card directly to the NTSC destination device. This usually uses an RCA-type phono-plug-to-phono-plug connection. The various cards provide a variety of features, from only video out to video overlay to frame grabbing to special video effects.

Note: In this article, the reference to frame grabbing indicates the ability to grab a frame of video in 1/30 of second. Scanning indicates the need for more time to acquire the image. This generally requires using a video camera for input, because most freeze-frame images are not usable for source material. The issue concerns the lack of video sync during freeze-frame mode.

There is currently one RGB to NTSC converter box available. Tech Comm has not been able to test this box, so we are unable to provide additional details. However, it appears that it should work correctly with the new video cards when the correct cable is used. It does work with the older 8-bit Macintosh color video cards when used with the interlace utility Apple has made available. The box is from ComputerVideo and is called Video NTSC Encoder.

RasterOps has announced The RasterOps Video Expander box, which is listed as compatible with the new Apple video cards. The RasterOps box provides both composite and S-Video (for S-VHS, HiBand 8mm and ED Beta) output signals. This converter also requires the correct cable to be used. Again, Tech Comm has not had the opportunity to test this card with the new video cards. Beyond the conversion to NTSC, these converter boxes do not provide any additional features to the video card that is used. These boxes require the signal coming from the cards to be in the NTSC interlaced mode.

For the finest conversion of RGB to NTSC, a scan converter is required. They are far more expensive than the converters mentioned above. Scan converters are used to create the highest-quality broadcast image. Scan converters not only convert the RGB signal to NTSC, they also eliminate the flicker associated with horizontal single-pixel lines and provide aspect-ratio conversion, color-bar generation, video transitions, freeze frame, and video mixing--all at the best available quality. The scan converters take the high scan rate RGB signal directly from the video cards, convert it to a digital frame buffer, do their functions digitally, and reconvert the image in an analog NTSC signal. This lets you do a function similar to Apple's 8-bit convolution on 24-bit images.

The RasterOps 364 does not provide NTSC video output without the use of the Video Expander box. In this respect, it is the same as the Display Card 8/24 GC. The frame grabbing ability and the live video on the Macintosh RGB display, however, do set it apart from the Display Card 8/24 GC. The 364 card does not provide the ability to overlay computer graphics on top of the live video. The live video window can be placed on top of a graphic background. None of the background will be seen through the live video image. The live video window is resizable.

The NuVista cards from TrueVision also provide frame grabbing from a video source. To lay the image back to videotape, the TrueVision VIDI/O converter box is required. The NuVista are not designed to provide live video images on the Macintosh RGB screen. Instead they provide the ability to overlay the Macintosh graphics on top of the video image. This composited image must be viewed on an NTSC screen.

Mass Micro provides a two-card set, the ColorSpace III and ColorSpace F/X cards. The ColorSpace III provides NTSC output of a Macintosh 8-bit image. It can also overlay the Macintosh graphics on top of video fed into the card. This composited image will appear on the NTSC device. Limited, non-real-time scanning can be accomplished. With the addition of the F/X card, a variety of video special effects can be achieved with the video signal being sent to the Macintosh.

The video image can be compressed, stretched, flipped, and so on in real time for use in the NTSC world. The F/X card can also frame grab from the incoming video in 24-bits. With the ColorSpace III and F/X cards the single-pixel line flicker problem is addressed. They do not use convolution as Apple does. Rather, they have devised their own method of addressing this NTSC issue.

The Orange Micro Personal Vision card offers frame grabbing and the ability to display incoming video on the Macintosh RGB screen. The Personal Vision card does not have an NTSC video output on the card. This card relates most to the RasterOps 364 card. However, we don't know of any RGB-to-NTSC converter box for the Personal Vision card.

Some of the video cards that have onboard NTSC video output also offer the ability to overlay the Macintosh graphics on top of incoming video to provide a composite image at the NTSC output. This feature needs to be checked for any card being considered for combining video sources with Macintosh graphics.

## A/UX: Porting C Code from SUN (9/94)

Revised: 9/20/94  
Security: Everyone

A/UX: Porting C Code from SUN (9/94)

Article Created: 19 June 1990  
Article Reviewed/Updated: 19 September 1994

TOPIC -----

I have a question about Berkeley UNIX type compilers that run on a SUN/3 and similar machines. Would code compiled on a typical C compiler on a SUN run relatively unaltered (assuming recompilation) under A/UX?

Because we don't implement full Berkeley, would a program for a SUN system have to be radically re-written to run on a Macintosh running A/UX?

DISCUSSION -----

A/UX is based on AT&T System 5.2.2. All C codes written on any System V.2.2 based system (use of standard System V.2 C compiler) should compile and run under A/UX without any change.

Since SUN/3 is based on BSD 4.[23] UNIX, there are differences between AT&T System V.2.2 and BSD UNIX 4.[23]. The area of difference includes ioctl() system call, signal handling, directory structure, and so on. Therefore, if the C code involves these differences, it needs to be modified to run on A/UX.

A/UX also supports UNIX 4.2BSD-style signals (software interrupts) and Berkeley UNIX 4.2-style network systems. For example, A/UX includes set42sig() so you can use the 4.2BSD signals. The Berkeley TCP/IP networking facilities like socket(), bind(), connect(), and so on are supported.

Now that the A/UX 2.0 and 3.0 kernel implements Berkeley file system (UFS), the system calls for UFS file system structure are available and supported.

Be aware that if the C code contains SUN specific (non-Berkeley or non-standard UNIX calls), it has to be re-written for A/UX. In short, porting C code to A/UX should not be a difficult task, although there are differences between System V.2.2 and BSD UNIX.

## A/UX: X Window System Symbolic Links

Revised: 9/18/92  
Security: Everyone

A/UX: X Window System Symbolic Links

Article Created: 23 June 1990

### Article Change History

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I am installing X Windows. I have installed the software without problems, but when I run it, I get "X11BINDIR ENVIRONMENT ERROR". This is because I am using a second partition mounted under my own directory. I know that I need to do a symbolic link for some files, but I don't know to which ones and the manual has nothing about accessing X Windows under another directory.

When there is no room to install X in the root directory, why isn't this information included in the manual?

### DISCUSSION -----

If you installed X11 Window System (the Native X) on a separate partition, make sure the following files and directories are symbolically linked or copied to the right places:

```
ln -s ../../bin/X11      /usr/bin/X11
ln -s ../../lib/X11      /usr/lib/X11
ln -s ../../include/X11  /usr/include/X11
ln -s ../../lib/lib*X*.a /usr/lib
cp /usr/lib/X11/xterm*    /usr/lib/terminfo/x
cp /usr/lib/X11/.x11start /
cp /usr/lib/X11/Sample.twmrc /.twmrc
```

Also, edit the .profile (for Bourne or Korn shell) or the .login file (for Csh shell) to include the /usr/bin/X11 directory in the search PATH.

The X Window System installation document does mention it requires 12MB of free disk space, and the Xinstall shell script also checks the available disk space before actually performing the installation.

For more information, refer to "Chapter 3 Install X11" in the "Getting Started With X Window System for A/UX" documentation.

## A/UX 2.0: Macintosh Applications Can Use 32-Bit Addressing

Revised: 9/30/92  
Security: Everyone

A/UX 2.0: Macintosh Applications Can Use 32-Bit Addressing

=====

Article Created: 19 June 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Does A/UX 2.0's 32-bit addressing extend to the "MultiFinder" process? That is, if I am running "normal" Macintosh applications under A/UX 2.0, do I have access to more than 8MB of memory space?

### DISCUSSION -----

Yes, A/UX 2.0's 32-bit addressing capability can be extended to the Macintosh applications which run under A/UX 2.0 MultiFinder Environment. However, the Macintosh application can access up to 16MB, because this is the maximum memory size allowed in Macintosh OS.

The size of the Macintosh application's memory address space can be changed via either ResEdit or Get Info. Note that there is a limitation on using the "Get Info" method; it lets you key no more than four digits. Therefore, use ResEdit if you require a change of more than 9999K.

To have your Macintosh applications run in the A/UX 2.0 32-bit environment, make sure you have sufficient virtual memory allocated before the session is started. There are two ways of controlling the size of the virtual memory allocation:

- 1) By assigning a value to an environment variable TBMEMORY. For example, "TBMEMORY=16m; export TBMEMORY" (or put them in the .profile file or .login file), logout then login again. This will create a 16MB virtual memory for MultiFinder.

2) By passing a flag when starting the "startmac" process. For example, edit the /mac/bin/mac32 file to have the "startmac" command line to read  
"/mac/bin/startmac -m16m &". This will create a 16MB virtual memory for MultiFinder.

The maximum feasible size for virtual memory is dependent on the environment (24-bit or 32-bit), and of course the size of the Swap space on the disk. For the 24-bit environment, the maximum virtual memory is 8MB; for the 32-bit environment the maximum virtual memory is 256MB.

System performance, however, will degrade if the virtual memory is much larger than the physical memory present in the system because a lot of paging and swapping activities will take place. A good rule of thumb is to keep virtual memory no larger than twice the size of physical memory present in the system.

## A/UX 2.0: How to Escape from a Hung Login Under X Windows

Revised: 9/18/92  
Security: Everyone

A/UX 2.0: How to Escape from a Hung Login Under X Windows

=====

Article Created: 19 June 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I created an interesting problem for myself. I was preparing a Macintosh IIIfx with X Window and mistyped a line into the PATH variable. When I tried to log in, I hung. I was finally able to break out of the login process, but it was time-consuming and not very intuitive. The typo was /usr/lib/X11, instead of /usr/bin/X11. Obviously, this didn't let the process look in the right place for the software, so it wouldn't boot properly.

Do you have any suggestions?

### DISCUSSION -----

As we have tested the above X11 session scenario (login as "Guest" without the /usr/bin/X11 in the search PATH) we won't get into the "hung" situation. It is true that the screen displays, "Starting session for Guest...", if no one presses the Return key.

At that "hung" point, however, if you only press Return, the default X11 session will come up. The default X11 session includes a "Console" window, two "xterm" windows, and three X client applications (xlogo, xload, and xclock). If you have pressed any printable key then Return, it will bring you back to the Login dialog box.

As we examine the /usr/bin/X11/X11 script, the above behavior becomes clear, because the X11 script does check if /usr/bin/X11 is in your search path, then asks you if it should be appended to your search path. This is why the

"Starting session for Guest..." message was waiting for your reply.

Note that the "x11debug.log" file will be created under the user's home directory, if any error is encountered. Check with that file for an explanation.

## A/UX: Supported Printing from UNIX (12/95)

Revised: 12/14/95  
Security: Everyone

A/UX: Supported Printing from UNIX (12/95)

Article Created: 19 June 1990  
Article Reviewed/Updated: 14 December 1995

TOPIC -----

This article describes printing features available to UNIX users.

DISCUSSION -----

A/UX 3.0 supports both AT&T System V and Berkeley BSD printer spoolers. The default printer spooler now is the Berkeley printer spooler that supports printcap (/etc/printcap) and remote printing capability.

You can configure printcap to print to locally connected devices like a serially connected ImageWriter or LaserWriter, or remote printers like other UNIX systems with lpd or TCP/IP capable Laser printers.

For more detailed information on Berkeley printer spooler system, refer to the printcap(4), lpr(1), lpc(1M), lpd(1M), lpq(1), & lprm(1) manual pages, and the "Setting Up Accounts and Peripherals for A/UX" documentation.

Additionally, printcap can be configured to make connections to AppleTalk printers, by have lpd use the AppleTalk protocol stack that is part of A/UX.

The input/output filters for AppleTalk LaserWriter Printer are provided in the /usr/spool/lpd/AppleTalk directory. For those who need to create multiple AppleTalk LaserWriters access, be sure to follow the instructions included in the input filter file (ifiler).

NOTE: The "pipe" file and filter files under each individual printer directory must be owned by "daemon" and grouped by "daemon".

As an example, to print a file "test", to a LaserWriter named "Metro" on an AppleTalk network (assuming the LaserWriter has a printcap entry "metro|mt") the user may give the command:

```
lpr -Pmetro test  
or   lpr -Pmt test
```

If the "-P" option is omitted, A/UX will print to either the default printer chosen from CHOOSER, from "at\_cho\_prn", or from the value of environment variable PRINTER.

For information on AppleTalk printing, refer to the atprint(1), atstatus(1), at\_cho\_prn(1), & atlookup(1) manual pages. Also look at "A/UX Networking Essentials" and "A/UX Local System Administration" manuals.

## A/UX 2.0: Virus Protection (6/93)

Revised: 8/12/93  
Security: Everyone

A/UX 2.0: Virus Protection (6/93)

=====  
Article Created: 16 July 1990  
Article Reviewed/Updated: 15 June 1993

TOPIC -----

What do you recommend for virus protection in the mixed A/UX-and-Macintosh OS environment?

DISCUSSION -----

We haven't heard of any virus reports on A/UX machines. Most anti-virus programs like "Disinfectant" or "SAM" should run under A/UX. Just check the product you plan to buy to make sure it works in the A/UX environment.

LaserWriter: All Printers on Network Need Same Driver

=====

Article Created: 19 June 1990  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 15 July 1992

TOPIC -----

I have Version 6.0.1 of the LaserWriter driver and Laser Prep. After installing it on one of our machines, I get a message that the LaserWriter contains an incompatible version of Laser Prep that cannot be removed and that I should restart the printer.

Restarting the printer doesn't help. The LaserWriter in question is spooled using the AppleShare Print Spooler on an AppleShare server. When the spooler "picks up" the LaserWriter, it must be downloading the Laser Prep to the LaserWriter. The problem is that I am spooling LaserWriters for two departments on this spooler and don't want to update both departments to the new drivers.

Will I have to update everyone to System 6.0.5 and the 6.0.1 LaserWriter driver?

DISCUSSION -----

The LaserWriter driver on the spooler determines the version needed by each workstation. Therefore, all printers captured by the spooler must use the same drivers. However, you need only update the users' drivers, not the system software. The 6.0.1 driver is compatible with Macintosh System Software 6.0.x.

In other words, if there are different versions of the LaserWriter Driver in your network on various Macintoshes, including System 7 versions, the printer will have to go through a lengthy process of reinitializing itself to a new version of the LaserWriter driver every time a different version is used in the printing process. In general, the best and most consistent approach is to update every Macintosh on the network with the highest

version of the LaserWriter driver being used on the network.

AppleShare: Folder "View" Is Set by Owner

=====

This article last reviewed: 19 June 1990

TOPIC -----

Is there any way to "set" an AppleShare file server, so that the folders and files are viewed by date instead of by folder as default?

DISCUSSION -----

The "View" choice for a folder is set by the owner of the folder. Once the owner has made the change (view by date, for instance), users of the folder won't see a difference until the folder has been closed by the owner.

Macintosh Portable: Modem Ring Detect Problem and Workaround

=====

Article Created: 19 June 1990  
Article Last Reviewed: 28 July 1992  
Article Last Updated: 4 August 1992

TOPIC -----

I have a Macintosh Portable. I experienced problems using the internal modem when the Portable's Ring Detect feature is on.

DISCUSSION -----

The Ring Detect setting is located in the Portable's Control Panel Device (CDEV) and lets users wake up their Portable when an internal modem detects a phone ring. This setting can be accessed only when an internal modem is installed.

This problem was fixed in System 6.0.7. System 7 also fixes the problem.

IBM 3476, 3477 Terminals: Emulation Alternatives (8/94)

Article Created: 25 June 1990  
Article Reviewed/Updated: 30 August 1994

TOPIC -----

I have an IBM AS/ENTRY model A20 with 3476 B20 and 3477 D20 terminals. I would like to replace the terminals with Macintoshes.

Do you have technical information on those terminals, and are you aware of any products for the Macintosh to emulate those terminals?

DISCUSSION -----

We are not sure about models B30 and D20. Here is what we got from IBM brochures:

IBM InfoWindow 3476 Monochrome Models EA and EG:

- 14-inch, low-glare etched flat screen
- Choice of amber (EA) or green (EG) characters on a black background
- Enhanced ergonomics
- Low-cost, entry-level 5250 compatibility
- Choice of three low-profile keyboards

IBM InfoWindow 3477 Monochrome Models FA and FG:

- 14-inch, low-glare etched flat screen
- Choice of amber (FA) or green (FG) characters on a black background
- Enhanced ergonomics
- Full-function 5250 compatibility
- Choice of two low-profile keyboards
- Printer port for host or screen print

We don't know of any Macintosh programs that emulate the two terminals you mentioned, but because they are 5250-compatible, you can use one of the following alternatives:

Andrew Corp. provides a system of hardware and software for connecting to both the AS/400 and System 3x computers. Their product line includes MacTwin, NetAxxess, TokenAxxess, Boxer (protocol converter), and TCPAxxess.

IDEAssociates has a Macintosh product for connecting to AS/400 computers and to System 3x computers. IDEAcomm Mac version 1.0+ is the product's name.

Wall Data has a Macintosh product line for connecting to an AS/400. Their product line includes SNA•ps 5250 stand alone product, SNA•ps 5250 client, and SNA•ps Gateway.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

#### Article Change History:

30 Aug 1994 - Updated third-party vendor alternatives.

Macintosh: Support for External Floppy Drives (9/95)

Article Created: 25 June 1990  
Article Reviewed/Updated: 26 September 1995

TOPIC -----

I want to use two Apple 3.5-inch external floppy drives with my Macintosh. I have tried to chain them together, but the system recognizes only the first drive in the chain. Can I use more than one external floppy drive?

DISCUSSION -----

NOTE: No Macintosh computer supports more than one external floppy drive. Only the Macintosh SE and later support the Apple SuperDrive (Apple FDHD).

Begin\_Table

Macintosh: Photo Downloading from Wire Services

=====

This article last reviewed: 25 June 1990

TOPIC -----

Do you know of any product that will permit a newspaper to download photographs from a photo wire service.

DISCUSSION -----

All of the news wire services we checked with feel that though this would be highly desirable (to download pictures directly into a Macintosh), this capability doesn't exist for any PC.

The news wire services presently support "photo" downloading to printers only, a service that can be purchased from Independent Network System (INS).

## Ethernet: Preventing Macintosh IIci Performance Degradation

Revised: 7/16/90  
Security: Everyone

Ethernet: Preventing Macintosh IIci Performance Degradation

=====

This article last reviewed: 27 June 1990

TOPIC -----

Apple engineering has discovered performance degradation under the following configuration:

- EtherTalk NB Revision K card
- EtherTalk 2.0.1 or 2.0.2 software
- Macintosh IIci
- On-board video and four or more colors (In 2-bit or greater mode).

DISCUSSION -----

To avoid Ethernet performance degradation on a Macintosh IIci, choose from among these three options:

- Use an EtherTalk NB Revision L card (shipping since December of 1989).
- Do not use on-board video (i.e. use a video card)
- Use only black and white video (1-bit video)

If you're using EtherTalk software, the Ethernet performance can be improved somewhat by starting the Macintosh IIci in 1-bit video and later switching to 2-bit or more video. This workaround is effective when using EtherTalk software (AppleTalk), but not MacTCP software (like MacX.)

The Ethernet performance can also be improved somewhat if you start the Macintosh IIci in LocalTalk and then switch to EtherTalk. This doesn't help in the MacTCP case, unless you are running MacTCP over EtherTalk, rather than standard Ethernet.

Security: Everyone

Macintosh Finder: Print Directory Workaround

=====

Article Created: 17 July 1990  
Article Last Reviewed: 19 July 1991  
Article Last Updated: 19 July 1991

TOPIC -----

I have a problem printing a disk directory from the Finder while in "View by Name" mode (running System Software 6.0.5 with the LaserWriter 6.0.1 and 5.2 drivers).

Black areas are printed on the pages along with the correct information. Sometimes, the areas are narrow, running along the right side of the page. Other times, the areas are broad, running right through the middle of the page. It is NOT a problem with the toner cartridge, as the black areas have a definite pattern like a scaled graphic character.

DISCUSSION -----

When you choose Print Directory for the directory of a folder or disk that has one or more locked files, and with the view set to something other than Icon or Small Icon, the pixels for the padlock are printed like fat bits on top of (or next to) the text. The size of the padlock (usually very distorted) varies.

You can work around the problem under MultiFinder by turning on background printing.

This has been fixed in System 7.

MacX: Key-Mapping Problem When Oracle Changes sysenvir to tty

=====

Article Created: 17 July 1990

### Article Change History

-----

04/20/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I'm having a problem with the new MacX.

I was using a Macintosh SE with Extended Keyboard on LocalTalk going through a GatorBox Box. The host was a SUN workstation; OS was 4.0

When doing Xterm or accessing an Xwindow based Oracle database, certain keys didn't seem to be mapping -- A, D, M, and N. Also, numbers on the top of the keyboard weren't being mapped, but the numbers on the side key pad worked fine.

What's the scoop?

### DISCUSSION -----

If you logged on to the X Window-based Oracle database, it was changing the sysenvir to tty mode. In our own test, we changed the Oracle profile so the userid was TERM=PC. This solved the problem.

## AppleShare PC: Switching From PostScript to Epson

Revised: 7/30/90  
Security: Everyone

AppleShare PC: Switching From PostScript to Epson

=====

This article last reviewed: 17 July 1990

TOPIC -----

Are there any DOS batch files that will switch AppleShare PC print services from PostScript to Epson mode transparently as a pre-defined application is loaded, and then back again when the application is quit?

(The two applications in question are Smartterm and CrossTalk. Both are being used for All-in-1 emulation.)

Barring the batch files, do you have any other suggestions. It's unacceptable to me to have to access the ASPC chooser every time I want to use All-in-1?

DISCUSSION -----

The easiest solution would be to establish two connections to the same LaserWriter. One connection can be set up to use PostScript, and print to LPT2 (or the first available). The second can then be set up to use Epson emulation and print to LPT3 (or the next available). You would then configure one application to print to LPT2 and the other to LPT3. (We have done this with AppleShare PC 2.0 and 2.0.1 and it works fine.)

The connections can be configured from DA to be established automatically on startup, so that you need only remember that printing to LPT2 uses PostScript and printing to LPT3 uses Epson emulation.

Article Last Updated: 13 September 1991

### TOPIC -----

I need to access a database on an IBM 3090. It's called DATACOM, by Computer Associates International. Can you help?

### DISCUSSION -----

CA-Datcom/DB is a database management system from Applied Data Research (ADR) which was acquired by Computer Associates International in 1988. Since then, CA has tried to merge Datcom/DB with its other DBMS product: CA-Universe. Prior to release 8.0, Datcom/DB did not provide SQL capability.

A terminal emulation program such as MacDFT would allow access to IBM hosts and databases. However, we assume you would like to access the database in the client/server fashion, such as what is offered by Data Access Language (formerly CL/1). We provide DAL servers for both VM/CMS and MVS/TSO. However, on VM/CMS, DAL servers only allow access to IBM's Structured Query Language/Data System (SQL/DS) and on MVS/TSO, only Database 2 (DB2). There is no adapter currently for CA-Datcom/DB.

For more information, search under "Computer Associates".

## Macintosh IIfx: CDC Wren Hard Drive Compatibility (11/94)

Revised: 11/21/94  
Security: Everyone

Macintosh IIfx: CDC Wren Hard Drive Compatibility (11/94)

=====

Article Created: 17 July 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

Is there a way to connect a CDC Wren Series 7 94601 or CDC Wren Series 6 602 to the SCSI port of the Macintosh IIfx? Both hard disks need to be connected synchronously.

DISCUSSION -----

We called Seagate Technical Support and asked them about the two drives mentioned above. They were aware of the CDC Wren 94601 but not the CDC Wren 602. There is a CDC Wren 94602 but it is not compatible with the Macintosh. Note: CDC is a division of Seagate.

There is a specific model of the CDC Wren 94601, the CDC MacWren 94601-1.2GM, that is, according to Seagate, compatible with the Macintosh IIfx; other models of the CDC Wren 94601 are not compatible with the Macintosh IIfx. Driver software and cables are available from a company called Ontrack (Technical Support: 612-937-2121; Sales: 800-752-1333).

## Macintosh IIfx: SCSI Port and Hard Drive Performance

Revised: 7/11/91  
Security: Everyone

Macintosh IIfx: SCSI Port and Hard Drive Performance

=====

Article Created: 30 July 1990  
Article Last Reviewed: 23 April 1991  
Article Last Updated: 23 April 1991

TOPIC -----

How fast must a hard disk be to take full advantage of the speed (3 megabytes per second) of the Macintosh IIfx SCSI port?

DISCUSSION -----

A hard disk drive with a sustained data transfer rate (not to be confused with "throughput") of 3 megabytes per second or faster will take full advantage of the improved performance of the Macintosh IIfx SCSI port.

This transfer rate is independent of the operating system. For example, there is no difference in the transfer rate when using A/UX.

ELF: Where to Get More Information (11/94)

Article Created: 17 July 1990  
Article Reviewed/Updated: 22 November 1994

TOPIC -----

I have lots of questions about the ELF (Extremely Low Frequency) radiation issue.

For example, how does the radiation from a 27-inch television viewed at 24 inches (the standard viewing distance for my seven and ten year old boys despite constant harassment on my part) compare to the radiation from an Apple Color RGB monitor viewed at 14 inches?

Where can I get such information?

DISCUSSION -----

The Apple Environmental Health & Safety group is responsible for information on Apple products and ELF emissions. While they do not currently have any direct access for the general public, questions can be posed to the Customer Assistance Center at 800-776-2333.

The Customer Assistance Center will do their best to obtain an answer to your questions.

TCP/IP: Network Administration Recommended Reading

=====

Article Created: 13 July 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Can you suggest a good book on TCP/IP from a network administrator's point of view?

### DISCUSSION -----

We don't know of any TCP/IP network administrator-specific books. However, there are two well-known TCP/IP documents that you might find helpful: "Introduction to the Internet Protocols" and "Introduction to Administration of an Internet-based Local Network." They are available from Rutgers University, Computer Science Facilities Group. Contact them from the internet

Also, the "A/UX Network System Administration" documentation is a good reference for TCP/IP administration. It includes B-Net (TCP/IP), NFS, Subnet, Slip, Yellow Pages (client and server), and AppleTalk network issues.

## A/UX 3.0 Workstation Information (9/94)

Revised: 9/19/94  
Security: Everyone

A/UX 3.0 Workstation Information (9/94)

Article Created: 13 July 1990  
Article Reviewed/Updated: 19 September 1994

TOPIC -----

This article contains a series of questions about using Macintosh IIci systems as A/UX workstations.

- 1) How many NuBus slots can be connected as 802.3 Ethernet ports?
- 2) What UNIX is A/UX based on?
- 3) What about the A/UX C compiler?
- 4) Does the current version of A/UX support menu-driven System Administration type of function?
- 5) Are the remote system administration utilities like "rdump" and "rrestore" supported in A/UX?
- 6) Does A/UX support Xerox's Ethernet (XNS)?
- 7) Does A/UX support RFC 943?
- 8) Does A/UX support RFC 951 (Bootstrap Protocol)?
- 9) How many physical layer supported connections can you have?
- 10) How many sockets per session can you have?

DISCUSSION -----

Here are the answers:

- 1) In theory, up to 6 NuBus slots can be connected as 802.3 Ethernet ports.

- 2) The current version of A/UX 3.0 is based on AT&T System V2.2 UNIX with BSD 4.[23] extensions which include software signals and Internetwork facilities. It conforms to SVID (System V Interface Definition) and SVVS (System V Verification Suite). Also the System V3 Streams is supported in A/UX.
- 3) The A/UX C compiler is driven from the standard AT&T System V.2 C compiler. However, it is not ANSI C compatible.
- 4) The current version of A/UX does not support menu driven System Administration type of function.
- 5) The remote system administration utilities like "rdump" and "rrestore" are supported in A/UX.
- 6) Currently, A/UX 3.0 does not support Xerox's Ethernet (XNS), but a third-party might have solution on it, for instance the BSD 4.3 UNIX supports XNS protocol. Porting to any UNIX box should be easy.
- 7) RFC 1117 is pretty standard in Internet. It replaced the obsolete RFC 943. Basically, DDN Network Information Center (NIC) maintains the assigned network number for the Internet community, Class A network is assigned with numbers between 1 and 127, Class B network is assigned with numbers between 128 and 191, and Class C is assigned with numbers between 192 and 255. This is supported by A/UX.
- 8) RFC 951 (Bootstrap Protocol) describes an IP/UDP bootstrap protocol (BOOTP) that lets a diskless client machine discover its own IP address, the address of a server host, and the name of a file to be loaded into memory and executed. The current version of A/UX 3.0 does not support bootp.
- 9) The number of physical layer supported connections can be up to the number of available NuBus slots. (That's 6 in Macintosh IIX.)
- 10) The number of sockets per session can be configured via "kconfig" to as many as the user wishes. However, for the sake of performance, more physical memory is needed if the number of sessions is increased. The default is 16.

## Floppy Drive Port: Maximum Power Load (11/94)

Revised: 11/21/94  
Security: Everyone

Floppy Drive Port: Maximum Power Load (11/94)

Article Created: 30 July 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I am interested in the Integrated Data Systems IDS-WIP series drive. It is a low-power, compact SCSI drive that gets its power from the external, floppy port.

Are there any possible problems with this drive? Would it invalidate Apple's warranty? They mentioned in its specifications that it uses from .25 to 1.5 watts maximum draw, depending on the size of the hard disk.

DISCUSSION -----

The power budget of this port varies slightly with each of the Macintosh models, but the worst-case scenario follows. The combined load of all devices connected to the floppy drive ports shouldn't exceed the following:

|     |               |
|-----|---------------|
| +5  | 700 milliamps |
| +12 | 600 milliamps |
| -5  | 10 milliamps  |

Apple typically discourages using the floppy port in the way you describe. These ports were designed to support the 400K, 800K, and the 1.44MB Apple disk drives. The older Macintosh computers also had ROM support for the Apple HD20-- which provided its own power.

Because the drive you describe requires no physical modification to the Macintosh, powering a SCSI drive in this fashion would not void the warranty--unless the damage caused to the Macintosh is traced back to the drive.

## A/UX: Quantum Pro-80 Requires Different Formatting (9/94)

Revised: 9/21/94  
Security: Everyone

A/UX: Quantum Pro-80 Requires Different Formatting (9/94)

=====

Article Created: 10 July 1990  
Article Reviewed/Updated: 21 September 1994

TOPIC -----

I have been unsuccessful in installing A/UX 1.1.1 onto Quantum Pro-80 drives using the Apple HD Setup utility. I heard that there is a ROM difference between the Quantum drives I have and the ones Apple uses. My drives have Quantum ROMs, while Apple's have an Apple ROM. Have you heard of problems with Quantum drives?

DISCUSSION -----

According to Quantum technical support, the Pro-80 drive is not compatible with the Quantum Q280 drive which is used in the Apple HD 80SC. They use their own ROM. The Apple HD Setup software cannot be used to initialize the Quantum Pro-80 drive.

To install A/UX onto a Quantum Pro-80 drive, find a third-party disk formatter to format and partition it for A/UX. A good example is SilverLining from La Cie Ltd.

## A/UX: Change Process Priority with nice (1) and (2)

Revised: 9/16/92  
Security: Everyone

A/UX: Change Process Priority with nice (1) and (2)

=====

Article Created: 10 July 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Apple gives a high priority or time slice to the mac32 process. I'm developing a product that needs to throw up a dialog saying that it's going to process data and then take over as much of the CPU's time as possible.

Do you have any tools and/or facilities to give priorities to specific tasks? Ultimately, I would like to shut off tasks like network daemons, cron daemons, and so on.

### DISCUSSION -----

A/UX supports both nice (1) and nice (2). These let you run or change the priority of a process.

nice (1), which is available from the command level, executes the specified command with a lower or higher CPU scheduling priority. Note that the nice built-in function in the C shell is different from /bin/nice, so be careful using nice. The superuser may run commands with priority higher than normal by using a negative increment. For example:

```
/bin/nice --15 wc /usr/dict/words
```

causes the program "wc" to be run with higher priority than a normal process. See nice (1) manual page for more details.

nice (2) is a system call to change the priority of a process. It adds the

increment value (specified in the argument) to the value of the calling process. See nice (2) manual page for more details.

## Farallon StarController: IIGS and IIfx Upgrade Information

Revised: 7/30/90  
Security: Everyone

Farallon StarController: IIGS and IIfx Upgrade Information

=====

This article last reviewed: 10 July 1990

TOPIC -----

Is there a known problem using Macintosh IIfx systems with (older) Farallon's StarControllers similar to the problem with Apple IIGS systems on networks with StarControllers?

Do you have the date that StarControllers began shipping with the new PAL, and what is Farallon's policy regarding upgrading old controllers?

DISCUSSION -----

Farallon is aware of a performance loss when using the Macintosh IIfx and the Apple IIGS with the StarController, part number PN207. This occurs only on networks with Apple IIGS systems or Macintosh IIfx systems. Networks without these systems not experience any loss.

According to Farallon, the original StarController has been replaced with the PhoneNET StarController Series 300. The new product began shipping on April 30, 1990. Among other additions, this new version of the StarController contains the fix for the Apple IIGS and Macintosh IIfx.

For owners of the older StarController (PN207), chip upgrades (part number FX207) are available directly from Farallon. For more information, call Farallon customer service.

## AppleShare PC 2.0: How to Set Zones

Revised: 7/30/90  
Security: Everyone

AppleShare PC 2.0: How to Set Zones

=====

This article last reviewed: 10 July 1990

TOPIC -----

What is the analogous mechanism for PC users to change the zone they reside in? ANET? If so, which command(s)? I've gone over the manual and was unable to find the answer.

DISCUSSION -----

ANET is the correct command to use to set the zone that you wish the PC to reside in. The exact format of the command is:

```
ANET USE MLIDname Z zonename
```

where MLIDname is the name of the MLID you are using, and zonename is the zone you wish to reside in. Executing this command also stores these values in the NET.CFG file, keeping them across restarts of the machine. For more information on this command, check page 132 of the "AppleShare PC User's Guide."

## MacDFT v1.1: Doesn't Support IBM Entry Assist Function

Revised: 7/30/90  
Security: Everyone

MacDFT v1.1: Doesn't Support IBM Entry Assist Function

=====

This article last reviewed: 10 July 1990

TOPIC -----

Turning Document mode on enable's IBM's Entry Assist function. This feature works with several IBM host editors to provide limited local-formatting, entry, and edit control.

The key sequence that initiates this on a 3278 Model 2 terminal is "Alt-Blank" (on the MacDFT keyboard layout this is "Alt-CR POS"). Also, I have seen this function implemented on a PS/2 Model 60 using IRMA DFT.

I need to know if I can imitiate this function. However, I cannot get into Document mode, because I am already showing "Alt-CR POS" in the key position that produces this function on a 3278 terminal.

DISCUSSION -----

MacDFT 1.1 does not support IBM's Entry Assist function. If this functionality is needed, we suggest investigating DCA's MacIrma product, because it is likely to provide features similar to those found in their DOS products.

## LaserWriter: Direct Printing over Mixed Ethernet

Revised: 7/30/90  
Security: Everyone

LaserWriter: Direct Printing over Mixed Ethernet

=====

This article last reviewed: 20 July 1990

TOPIC -----

I have a Novell Ethernet network (spread over four floors) with 30 IBM PCs. I want to connect 20 Macintosh IIs. To date, I have tested two Macintosh directly connected to the Ethernet network (version 2.15c, Mac VAP 1.1). Both of the connected Macintoshes have InterLAN NIA310 MacConnect cards running the NIA310 driver, Rev. AA, version 1.0.

I would like to connect my LaserWriters to the Macintoshes and not to the Novell Server, because the Server is on another floor. I need a solution that lets Macintosh users connect directly to Ethernet and print to any LaserWriter linked through any Macintosh II AppleTalk printer port--without requiring the user to disconnect from Ethernet and connect to AppleTalk.

- 1) Can I use an Apple Internet Router?
- 2) If yes, can I use the InterLAN card, or do I need the EtherTalk NB Card?
- 3) Can I use, for example, the GatorBox or FastPath as another solution?

DISCUSSION -----

Netware for Macintosh (which is included with ELS Netware Level II 2.15, Advanced Netware 2.15, and SFT Netware 2.15) lets DOS, OS/2, and Macintosh users share Apple LaserWriters and Apple ImageWriters. Macintosh users have the option of printing directly to the printer or through the Netware print queue.

Because as Apple LaserWriters and Apple ImageWriters can be connected to the network only through their built-in LocalTalk connectors, you must use one of the routers that supports connections between LocalTalk- and EtherTalk-based networks. The Apple Internet Router, the GatorBox, or the FastPath can be used

for this purpose.

You should be able to use the same InterLAN cards, if you can successfully connect to the Netware server over EtherTalk with these cards.

## ImageWriter II/L: What Is It?

Revised: 7/30/90  
Security: Everyone

ImageWriter II/L: What Is It?

=====

This article last reviewed: 20 July 1990

TOPIC -----

I've seen references to an "ImageWriter II/L." What is it?

DISCUSSION -----

Apple has rolled out a new ImageWriter II printer without changing the printer's name. The easiest way to identify the new model is by observing where the serial or power connector is located. If the connector is on the leg of the printer, you have an old ImageWriter II. Otherwise, it is the recent model.

Service addressed the identification problem by using the suffix "/L" in all their service documents referring to the new printer. Articles in the Tech Info Library follow this same convention.

## Running AppleTalk for VMS 2.1 on a VAX Cluster

Revised: 8/28/90  
Security: Everyone

Running AppleTalk for VMS 2.1 on a VAX Cluster

=====

This article last reviewed: 27 July 1990

TOPIC -----

I want to run AppleTalk for VMS 2.1 on a VAX cluster, which has two VAX systems sharing the same disks. I cannot run AppleTalk for VMS on both VAX systems. A file called PORTDESC.TEXT can have only one AppleTalk network number and can be accessed only from a directory called ATK\$ROOT. Therefore, I can run AppleTalk for VMS from only one VAX at the time.

Is this a known problem, or is it a question of configuration?

DISCUSSION -----

PORTDESC.TEXT resides in the directory ATK\$ROOT:[APPLETALK]. This port descriptor file is a text file that stores port descriptions. When the router process is initialized, it uses the port descriptor file to set up the port handlers. The AppleTalk for VMS installation procedure creates this file for you, using the information you supply during the installation procedure.

ATK\$ROOT is a VMS logical name. You can assign it to any rooted directory. The default is SYS\$SPECIFIC:.

In a cluster environment, there is a common disk that stores the entire directory structure (the common root plus each node's local root). Each local root contains, in addition to the usual system directories, a [SYSx.SYSCOMMON] directory that is an alias for [VMS\$COMMON], the cluster common root directory, in which cluster common files actually reside. The disk Master File Directory (MFD) contains the local roots (SYS0 for NODE1, SYS1 for NODE2, and so on) and the cluster common root directory, [VMS\$COMMON].

The VMS Install Utility puts everything in SYS\$COMMON unless you specify a directory for the files. In AppleTalk for VMS installation, you have a choice for the directory ATK\$ROOT. ATK\$ROOT is a system-wide logical name assigned to a rooted directory. The default rooted directory is SYS\$SPECIFIC:. If you

install AppleTalk for VMS on each node and use the default rooted directory, most AppleTalk for VMS files are placed in ATK\$ROOT:[APPLETALK] and its subdirectories. In a cluster, SYS\$SPECIFIC for each node is unique. Therefore, the PORTDESC.TEXT and other files are in the unique directories for each node. Keep in mind that you must have a unique network number for each ATKVLAP port on each node, and the ATKAELAP ports on all nodes should have the same network number. That means that the PORTDESC.TEXT files are not the same on every node.

If you use the default SYS\$SPECIFIC for the default during the installation and have correct network numbers in the PORTDESC.TEXT file (like above), each VAX should read the correct file when you start AppleTalk for VMS.

The only problem with this, beside the PORTDESC.TEXT file (which you want to keep unique on each VAX), is that copies of all other files are kept on each node. This can be a waste of space, and it is difficult to manage the same copies of files on each node, especially on a cluster with many nodes. If you are concerned about this, install everything in SYS\$COMMON. Then, after installation, manually move the PORTDESC.TEXT file to each node SYS\$SPECIFIC:. Modify the PORTDESC.TEXT files to have unique VLAP network numbers.

Re-define the ATK\$ROOT logical name to search the node SYS\$SPECIFIC first, then SYS\$COMMON. When you start AppleTalk for VMS on each node, the cluster will search SYS\$SPECIFIC and find the PORTDESC.TEXT file for that node, and then it will go to SYS\$COMMON for the rest of the file.

## Printing to PostScript Printer Using Novell Server (7/93)

Revised: 8/4/93  
Security: Everyone

Printing to PostScript Printer Using Novell Server (7/93)

=====

Article Created: 28 August 1990  
Article Reviewed/Updated: 27 July 1993

TOPIC -----

I have a Macintosh Plus with system software 6.0.4 and 1MB RAM, connected via thin Ethernet (Nuvotech's SCSI Ethernet Device) to a Novell file server running 2.15c.

This Macintosh can access the file server without problems, but when it tries to print to a PostScript printer connected to the serial port on the file server, a NEC LC890, nothing prints -- the Macintosh can see the print queue, can go ahead and print to it, and the light blinks on the printer...but nothing happens.

Do you have any suggestions?

DISCUSSION -----

We contacted Novell Technical Support and they confirmed that the printer device has to be one of the Apple LaserWriters or Apple ImageWriters supported by Netware for Macintosh, OR a third-party printer which supports LocalTalk and the Apple printer dictionary.

The printers have to be on the LocalTalk network connected to the Novell server via a LocalTalk Adapter such as NL1000, or on any LocalTalk networks connected to an Ethernet network connected to the server via a LocalTalk-Ethernet router.

To locate a vendor's address and phone numbers, use vendor name as a search string.

AppleTalk Phase 2: Obtaining Node Number on Startup

=====

This article last reviewed: 27 July 1990

TOPIC -----

Under the AppleTalk Phase 2 protocol specification, a node remembers the node number previously assigned to it and that it is stored in the Macintosh. Does the Macintosh also remember the last network number it was associated with, and where is that number stored? If the network number is not stored, does the resolution begin at the base of the network range?

DISCUSSION -----

This information is on page 8 of the "AppleTalk Phase 2 Protocol Specification":

Obtaining a provisional address

Obtaining a provisional address upon startup is accomplished in two different ways depending on whether the node has previously saved an address in parameter RAM. An address saved in PRAM consists of two parts: the 16-bit network number, denoted \$nnnn, and the 8-bit node ID, denote \$yy. The concatenated 24-bit address value of [network number, node ID] is denoted \$nnnnyy.

If no address was previously saved in PRAM:

Upon starting up when no information is saved in parameter RAM, a node will randomly select a provisional network number \$FFnn in the startup range. This range is specified to be \$FF00 to \$FFFE inclusive (most significant byte first). The node then also randomly selects a node ID \$yy (yy cannot be \$00, \$FE, \$FF). As in AppleTalk Phase 1, the node must first use AARP to ensure that \$FFnnyy is not in use by any other node on the network. If another node is already using this address, the node should try all other possibilities for \$FFnnyy until a valid provisional address is obtained.

If an address was saved in PRAM:

If there is a saved 24-bit address of the form \$nnnnyy in PRAM, the node can use it as the provisional address. The node must use AARP to ensure that this address is not in use by any other node. If another node is already using this address, the node should try all other possibilities for yy (yy cannot be \$00, \$FE, \$FF) keeping nnnn the same until all possibilities are exhausted (nnnn is probably a valid network number for this network unless the node has been moved from another network).

If all possibilities are exhausted, the node must select a new address as if none was previously saved in PRAM (as described in the previous section).

## Macintosh IIfx: Hangs with Macintosh IIci AppleShare Server

Revised: 8/4/93  
Security: Everyone

Macintosh IIfx: Hangs with Macintosh IIci AppleShare Server

=====

Article Created: 27 July 1990  
Article Reviewed/Updated: 27 July 1993

TOPIC -----

I'm having a problem keeping a new Macintosh IIfx logged on to an AppleShare 2.0 File Server running on a Macintosh IIci over LocalTalk.

Apparently, whenever the Macintosh IIfx logs on to the server it freezes and locks up. When it isn't logged on to AppleShare, the Macintosh IIfx is fine. Also, the Macintosh IIfx can log on to other non-Macintosh IIci servers without freezing.

I'm running system software 6.0.5 on the Macintosh IIfx and version 2.0 of AppleShare on the Macintosh IIci. Other Macintosh II and Macintosh SE systems run fine. I haven't tried the Macintosh IIfx serial INIT yet, nor have I tried server connections over EtherTalk or TokenTalk.

Do you have any ideas on what I might do to isolate this problem? All non-Apple INITs have been removed from the Macintosh IIfx, and there are no known viruses.

DISCUSSION -----

We haven't encountered any problems during our testing of a Macintosh IIfx client on a Macintosh IIci AppleShare File Server over LocalTalk.

We tested the Macintosh IIfx both in the "compatibility" and "faster" modes. We wrote a program to run on the client Macintosh IIfx to write 512 bytes at a time to a file until it grew to 3MB, then erase the file and repeat the process. These specific tests ran over 24 hours. We also ran other tests over EtherTalk while investigating another unrelated issue, and the Macintosh IIfx client didn't hang during any of these tests.

Troubleshooting  
-----

- Have you tried running the Macintosh IIfx with the IOPs turned off/on?
- Do other Macintosh IIfx systems have the same problem?
- Are you using a clean system? (Did you trash the System Folder and reinstall?)
- Have you tried connecting other Macintoshes to the network connector that the Macintosh IIfx was connected to?
- Does the Macintosh IIfx in question have problems when connected to other physical networks?
- Are the other Macintosh systems used similarly; that is, are they connected to AppleShare for the same length of time, are they running the same software?

Another line of inquiry:

Is your Macintosh IIfx attached to a Farallon "Black Beauty" Star Controller or a Nuvotech TurboStar? Farallon and Nuvotech have acknowledged severe performance problems with the Macintosh IIfx over LocalTalk on their star repeaters.

Both Farallon and Nuvotech are shipping upgrades to fix compatibility problems with the Macintosh IIfx and the Apple IIGS. These systems exhibit extremely slow network response, sometimes to the point that they seem to hang, when using those network products. This may explain your problem.

Nuvotech's upgrade to their TurboStar involves exchanging the old connector for a new one. Arrange an upgrade by contacting Nuvotech. All new TurboStars shipped since approximately the middle of June 1990 have the upgraded components and can be identified by the rev number ECO #4 on the circuit board. This newer connector also fixes previous compatibility problems with ImageWriters having and using the LocalTalk Expansion Cards and with PCs using LocalTalk PC Cards.

Farallon's upgrade involves installing a new chip in the "Black Beauty" Star Controller (part #207--easily identified since the case is black). The new platinum-colored Star Controller (part number 307) contains the fix.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Change History:

- 27 July 1993 - Company title updated from Focus Enhancements to Focus Enhancements, Inc.
- 19 June 1992 - Focus Enhancement, Inc. has acquired the Macintosh connectivity product family from Nuvotech.

MPW: Installer Documentation Is On Developer Services BBS

=====

This article last reviewed: 27 July 1990

TOPIC -----

I was told that there would be documentation explaining modification of Installer Scripts for those of us who have MPW. Is this documentation now available (and do I already have it someplace?)

DISCUSSION -----

Installer documentation is on the Developer Services bulletin board. It includes a StuffIt archive containing documentation for Apple's Installer 3.0 and Tech Note #75, which documents Installer 3.0.1 scripting and changes from previous versions of the Installer.

The StuffIt package consists of the following:

- A ScriptWriter's Guide to Installer 3.0 (MacWrite).
- Technical Reference for Writing Installer Scripts (MacWrite).
- An MPW Rez file, InstallerTypes.r.
- An MPW Tool, ScriptCheck, for testing scripts.

A/UX 2.0: How To Stop "newconfig" From Dumping Modules

=====

Article Created: 27 July 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I have a problem with newconfig.

It seems that newconfig does not do an "eupdate" after building a new kernel. Therefore, when the system starts up and finds something strange, it takes the old kernel back from Eschatology. This leads to strange problems, like missing modules in the kernel.

Is it possible to include an eupdate in the script so the Eschatology information is automatically updated after a new kernel build?

### DISCUSSION -----

You are correct in stating that newconfig does not do an eupdate. However, we do not think that is the cause of your problem.

When the system is started up, and something "strange" is found (such as a new card installed), newconfig is run to rebuild the kernel. The file, /newunix, is used as the base for the new kernel. Since this is a minimal kernel, modules that you had previously installed will be missing.

It should be possible to write your own script that first called newconfig and then eupdate to save the new kernel in the Eschatology partition. When the system finds an invalid kernel and builds a new one, you could then restore your kernel from Eschatology.

Another method that many people use is to copy /newunix to /newunix.save and install the modules you want in /newunix. Then, anytime your kernel is rebuilt from this /newunix, you will automatically have all of the modules you want.

## A/UX: Only AppleTalk Phase 2 Is Supported (9/94)

Revised: 9/19/94  
Security: Everyone

A/UX: Only AppleTalk Phase 2 Is Supported (9/94)

=====

Article Created: 18 December 1990  
Article Reviewed/Updated: 19 September 1994

TOPIC -----

Using A/UX 2.0 and AppleTalk, it seems that we can run only EtherTalk Phase 2.  
Is there a way to switch back to EtherTalk Phase 1?

DISCUSSION -----

AppleTalk Phase 2 is the only version of AppleTalk supported under A/UX 2.0 and 3.0. There are no plans to provide Phase 1 support in the future. If AppleTalk Phase 1 is required, you must use LocalTalk or, for EtherTalk, use an AppleTalk Internet Router.

AppleTalk Phase 2 is our networking system, and Apple will not continue to support two different protocol stacks.

This has already been implemented in other products, such as TokenTalk and DEC PATHWORKS (formerly LanWORKS) for Macintosh, which support only AppleTalk Phase 2.

## MacX: Rootless Windows vs. Rooted Windows

Revised: 4/20/93  
Security: Everyone

MacX: Rootless Windows vs. Rooted Windows

Article Created: 27 July 1990

### Article Change History

-----  
04/20/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I'm very interested in using MacX to provide nationwide access to a database I'm working on. The software is written for X Window System and (mostly) works using MacX.

I would like to have the Macintosh handle the scrolling of an image that is larger than the window. Ideally, it would be a "rootless" window. If this is possible, I can ship a complete image across the country to a user and still have the user get "excellent" response to scrolling operations. If the program on the "client" side has to do the scrolling, performance will not be acceptable.

Can you help?

### DISCUSSION -----

The only way to do what you want is to use a rooted window in MacX. If you use a rootless window, the client application will be completely responsible for all scrolling, updating, and so on. At that point, the X Window System calls are being mapped onto the Macintosh's Window Manager by MacX, and everything is being handled remotely. This includes using the scroll bars, moving the window, sizing the window, and so on.

If you use a rooted window instead, MacX will handle the bitmap, including the updating and scrolling of images that are bigger than the Macintosh window they are being displayed in.

In this case, the Macintosh window has nothing to do with the X Window System Window Manager being used. Therefore, as long as the entire X Window System image has been drawn in the Macintosh window's GrafPort, MacX will handle the scrolling and updating locally.

Excel: Leading Space Will Enter Numeric String as Text

=====

This article last reviewed: 27 July 1990

TOPIC -----

When I enter certain text strings into Microsoft Excel, such as 2/5/80, the cell format is automatically changed to a date format. How do I avoid this without encapsulating the text in quotation marks?

In other words, how do I get Excel to treat certain text as text and not numerals?

DISCUSSION -----

To enter a numeric string in Excel as text, type a space before the entry.

Typing " 1/1/90" (without the quotes) into a cell formatted for "d/mmm/yy" displays 1/1/90 instead of 1-Jan-90.

## HyperCard: How To Use for Text File Column Alignment

Revised: 8/28/90  
Security: Everyone

HyperCard: How To Use for Text File Column Alignment

=====

Article Created: 27 July 1990  
Article Last Reviewed: 4 June 1992  
Article Last Updated:

TOPIC -----

I want to upload a Macintosh spreadsheet to an AS/400 - via a KMW box - as a text file with column alignment intact. Both WingZ and Excel write to text files, but add tabs between columns. I need to have spaces between columns to correctly align the columns using a nonproportional font.

I tried using Vantage/McSink, but it only left-justifies columns; I need right justification on numbers.

My idea was to get a generic TTY print driver to print the spreadsheet, then capture it to a text file for uploading. I received a TTY print driver from GDT Softworks, but can't think of a method/utility to capture printer output to a text file.

DISCUSSION -----

We aren't aware of a commercial solution to your needs, but HyperCard can be used for a custom workaround.

Use Vantage (or Microsoft Word or equivalent) to convert the tab-delimited output from the spreadsheet to comma-delimited text. HyperCard considers each spreadsheet entry in the text file an item in a line. You could even use HyperCard to do the tab-comma conversion, but for simplicity, we'll assume the tabs have been converted.

Read the comma-delimited text into a variable (we used "container1") and call the following code:

```
on mouseUp
  repeat with i = 1 to the number of lines in container1
```

```
    repeat with j = 1 to the number of items in line i of container1
      set cursor to busy
      put expand (item j of line i of container1) after container2
    end repeat
    put return after container2
  end repeat
  open file "your filename here"
  write container2 to file "your filename here"
end mouseUp
```

```
function expand which
  put 25 into fieldLength
  if which = empty
    -- send a string of spaces fieldLength long
    then
      repeat with i = 1 to fieldLength
        put " " after temp
      return temp
    end repeat
  else
    repeat with i = 1 to fieldLength - length (which)
      put " " after temp
    end repeat
    -- pad with spaces
    return temp & which
  end if
end expand
```

The formatted text is now saved as "your filename here".

(NOTE: The entire process could have been done while reading the text in a line at a time, rather than moving it into a container before expanding, but it was easier to explain as a multistep process.)

Display Card 8/24: RasterOps 19" 724 Is Not Supported

=====

This article last reviewed: 27 July 1990

TOPIC -----

I need to confirm that the Macintosh Display Card 8/24 does not support the RasterOps 724 19-inch monitor.

I know that the Macintosh Display Card 8/24 GC does not support the RasterOps 19-inch monitors based on its pinouts, but there is no mention of the Macintosh Display Card 8/24.

Are the pinouts for the Macintosh Display Card 8/24 GC the same as for the Macintosh Display Card 8/24?

DISCUSSION -----

The Macintosh Display Card 8/24 and the Macintosh Display Card 8/24 GC have the same connector and pinouts, and produce the same signals.

The RasterOps 724 19-inch monitor is not supported by either.

## Apple Products: EMI Susceptibility (10/95)

Revised: 10/30/95  
Security: Everyone

Apple Products: EMI Susceptibility (10/95)

Article Created: 28 August 1990  
Article Reviewed/Updated: 30 October 1995

TOPIC -----

I'm designing office workspaces to house computers and would like specifications for Apple equipment regarding acceptable electro magnetic environmental conditions.

For instance, what's the maximum 60Hz magnetic field Apple monitors can be exposed to before they produce objectionable jitter? Do you have any information about exposing disk drives to Electro-Magnetic Interference (EMI) fields, and so on?

In addition, I would like similar information on AC power supply specifications.

DISCUSSION -----

Except for disk drives, Apple does not perform EMI susceptibility tests on its products.

We test the disk drives to ensure that they have sufficient shielding to maintain data integrity in a typical home or office environment. As long as the drives remain in their housings, you should have a great deal of latitude when positioning them, even without adding additional shielding. They should certainly be fine in any normal home or work environment.

As a general rule, in the abnormal situation where EMI is present, your monitors will be visibly effected long before there is any affect to data on your disk drives or other hardware.

Macintosh Portable: VHF Emission Level Information

=====

Article Created: 27 July 1990  
Article Last Reviewed: 28 July 1992  
Article Last Updated:

TOPIC -----

Do you have any information on the VHF interference that the Macintosh Portable generates?

DISCUSSION -----

Apple doesn't publish the VHF levels of the Macintosh Portable, or of other systems or peripherals, which is probably why you didn't locate that information. Ironically, the Federal Communications Commission results ARE available to the public, and can be obtained from them.

The Macintosh Portable (as well as most other products we sell) is designed to be used in a home or work environment, and has been tested to comply with the limits set for an FCC Class B computing device or equivalent in all countries it is sold in. This means that it is less "noisy" or likely to cause interference than a Class A device, which can legally be used only in a work environment.

Page X of the Macintosh Portable Owner's Guide lists some measures that minimize or eliminate the Macintosh Portable's potential for radio-frequency energy interference with other electronic devices, such as radios and televisions.

## LaserWriter IINTX: Can't Print HPGL Files Without Translation

Revised: 8/28/90  
Security: Everyone

LaserWriter IINTX: Can't Print HPGL Files Without Translation

=====

This article last reviewed: 2 August 1990

TOPIC -----

There are no Macintosh systems involved in this.

HPGL (a Hewlett-Packard protocol), and my LaserWriter IINTX can emulate an HP LaserJet Plus.

Therefore, if you connect our LaserWriter IINTX to a PC through the serial port, can you print HPGL format? (I don't want to convert the file before printing.)

Is it up to the program I'm using to emulate an HP plotter on an Apple LaserWriter?

DISCUSSION -----

Briefly, the LaserWriter IINTX emulates an HP LaserJet Plus. LaserJets use PCL, not HPGL; a PC printing an HPGL print job cannot print to a LaserWriter IINTX.

Hewlett-Packard uses different printer control languages -- including HPGL and PCL -- for their different printers. HPGL is commonly used by CAD/CAM type programs for outputting to plotters; PCL is used by more common, generic programs for outputting to HP LaserJets and similar printers.

Apple's PostScript LaserWriters emulate Diablo 630s. In addition, the LaserWriter IINTX emulates an HP LaserJet Plus; therefore, a program that uses PCL and is LaserJet Plus compatible can print to the LaserWriter IINTX when the LaserWriter IINTX is in its LaserJet Plus emulation mode. Again, you cannot print an HPGL print file directly (without file translation) on the LaserWriter IINTX.

If you want to print to an Apple LaserWriter, you must use a program that

supports a Diablo 630, LaserJet Plus, or PostScript-compatible printer. If your program and drivers do not support these types of printers, you need to export and, possibly, translate the data before importing the data to a program that does -- whether that program runs on a PC, Macintosh, or another system.

## LaserWriter IINTX: How To Print HPGL Files from a PC

Revised: 8/28/90  
Security: Everyone

LaserWriter IINTX: How To Print HPGL Files from a PC

=====

This article last reviewed: 2 August 1990

TOPIC -----

Is it possible to write HPGL files from a PC to a Macintosh LaserWriter IINTX without converting them to PICT or PostScript?

DISCUSSION -----

Two possibilities that might work are:

- 1) PlotView (formerly called MacHP) from Stevens Creek Software allows you to open and display Macintosh HPGL files on a Macintosh, and copy and paste them into other Macintosh programs for embellishment before printing to a LaserWriter. If you can use Apple File Exchange or a similar program and perform a generic text translation on the PC HPGL file, you can then open it with PlotView. This may work, but may require a little experimentation and manipulation with ResEdit or similar programs. Another option is to write your own AFE translator.
- 2) Another program that may work is called CADMOVER from Kandu, which is a 2-D/3-D Macintosh-based vector graphics translation utility, with bidirectional IGES, DXF, PICT, MacDraw, Minicad+, MacConcept, HPGL, Minicad+, Dimensions, Hyperspace and Space Edit.

Both products are listed in the Tech Info Library and/or the buyer's guides on AppleLink.

We feel the easiest solution would have been to select a program on the PC that also prints to a PostScript printer or, at least, use a program that can save the file in a format (not just an HPGL print file) that can also be read by other Macintosh or PC programs that can print to a PostScript printer. There may be PC programs that open HPGL files and save in a more commonly used file format, but we aren't familiar with any.

For more information, search under: "Stevens Creek" and "Kandu"

A/UX: Ethernet Input Errors (9/94)

Article Created: 2 August 1990  
Article Reviewed/Updated: 19 September 1994

TOPIC -----

I seem to have a high number of input errors on two Macintosh computers running A/UX on ethernet. This number increases all the time.

For instance, today:

Mac1:

| Name | Mtu  | Network     | Address | Ipkts   | Ierrs | Opkts  | Oerrs | Coll |
|------|------|-------------|---------|---------|-------|--------|-------|------|
| ---- | ---  | -----       | -----   | -----   | ----- | -----  | ----- | ---- |
| ae0  | 1500 | nta-ring    | bic     | 2003687 | 2398  | 461618 | 0     | 0    |
| lo0  | 1536 | loopback-ne | loop    | 20802   | 0     | 20802  | 0     | 0    |

Mac2:

| Name | Mtu  | Network     | Address | Ipkts   | Ierrs | Opkts  | Oerrs | Coll |
|------|------|-------------|---------|---------|-------|--------|-------|------|
| ---- | ---  | -----       | -----   | -----   | ----- | -----  | ----- | ---- |
| ae0  | 1500 | nta-ring    | cm      | 2126045 | 2350  | 547482 | 0     | 0    |
| lo0  | 1536 | loopback-ne | loop    | 18989   | 0     | 18989  | 0     | 0    |

Is this normal, or do we have a problem?

DISCUSSION -----

The following input errors are reported as "Ierrs" by netstat:

- receive CRC errors
- frame alignment errors
- fifo overflows

- missed packet errors

One or all of these errors could be causing netstat to report the Ierrs. Unfortunately, all of these errors are summed together to create a global input error counter for each interface. This counter is what netstat is reporting to you.

As you probably already guessed, there is no program to separate the error counters for each type of input error. Without such a tool, we have little idea of what is causing the problem.

You are seeing about a 1% hit on inbound traffic. This is fairly high, but not necessarily a cause for alarm. Higher-level protocols usually take care of problems encountered in any lower layers. The problem won't be seen or felt by the user unless it is a serious enough problem to cause degradation or loss of services. You should monitor this situation, but until you can determine exactly what errors are being reported, all we can do is guess at what the problem might be.

If it's only the A/UX systems that are experiencing these errors, you can probably eliminate the physical network as the problem. Since this is a very busy network, you're probably seeing a few missed packets, and there are probably a fair amount of collisions on this Ethernet, which we suspect are frame alignment errors on the receive. All of these, with an occasional CRC error, could cause the number of errors you're seeing. It really depends on the environment and amount of traffic on the Ethernet as to how many errors will be reported as input errors.

A/UX 2.0: Problem Running rez (9/94)

Article Created: 2 August 1990  
Article Reviewed/Updated: 21 September 1994

TOPIC -----

I am having a problem trying to run rez under A/UX 2.0. I am using the same rez line from a makefile that runs perfectly under A/UX 1.1.

The line under A/UX 1.1 is:

```
/mac/bin/rez -i /cardinal/cape/HEADER/v4r8m0 -o %test test.r cursor.r
```

Under A/UX 2.0 Golden, I tried the following:

When using launch, I tried the following commands:

```
==>> ops_test.pechner /cardinal/cape/APPL/v4r8m0> /mac/bin/launch /mac/bin/rez  
-i /cardinal/cape/HEADER/v4r8m0 -s /cardinal/cape/HEADER/v4r8m0  
-o %test test.r cursor.r
```

```
==>>ops_test.pechner /cardinal/cape/APPL/v4r8m0> /mac/bin/launch /mac/bin/rez  
-i /cardinal/cape/HEADER/v4r8m0 -s /cardinal/cape/HEADER/v4r8m0  
-o %test test.r cursor.r
```

```
==>>ops_test.pechner /cardinal/cape/APPL/v4r8m0> /mac/bin/launch /mac/bin/rez  
-i /cardinal/cape/HEADER/v4r8m0 -s /cardinal/cape/HEADER/v4r8m0  
test.r cursor.r -o %test
```

```
==>>ops_test.pechner /cardinal/cape/APPL/v4r8m0> /mac/bin/launch /mac/bin/rez  
-o %test test.r cursor.r
```

These give the following results:

```
### /mac/bin/rez - OS error -43 (Error message file not available)  
during open of "%test".  
### /mac/bin/rez - Fatal error trying to open the resource file "%test"
```

```
for writing.  
### /mac/bin/rez - Fatal Error, can't recover.  
### /mac/bin/rez - Since errors occurred, Ttest's resource fork was not  
written.
```

Without using launch:

```
==> /mac/bin/rez  
-i /cardinal/cape/HEADER/v4r8m0 -s /cardinal/cape/HEADER/v4r8m0  
-o %test test.r cursor.r
```

I get the following result:

```
/cardinal/cape/APPL/v4r8m0: No such file or directory  
ops_test.pechner /cardinal/cape/APPL/v4r8m0>
```

What has worked is when I output to the default rez.out and when I specify the full pathname in test.r "#include".

Therefore, rez is not recognizing the options "-i" and "-o". It also must be "launched" to run.

Can you explain?

DISCUSSION -----

The man page (the manual command) for rez(1) states that you must be in 32-bit mode and run the command from the command line (without using launch). You didn't specify the environment you were in when you were trying to run this.

The -o option to rez seems to work fine as long as you don't specify an output filename with a % appended to it. Rez is supposed to take the name you gave it from the -o option and affixes a % sign to it.

The -s option to rez also seems to be broken, but the -i option (which basically does the same thing) does work correctly.

Otherwise, this problem is currently (as of August, 1990) without a solution.

## System Software 6.0.5 and System Heap Size Adjustment (11/94)

Revised: 11/21/94  
Security: Everyone

System Software 6.0.5 and System Heap Size Adjustment (11/94)

Article Created: 7 August 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I have heard that when you upgrade to System Software 6.0.5, you should also increase your system heap size at least 32K via SUM Tools or Heap Fixer. This is supposed to increase compatibility with third-party programs.

Is this correct? If yes, what utility do you suggest?

DISCUSSION -----

In our testing, System Software 6.0.5 does NOT require the system heap size to be adjusted to work properly with Apple or third-party software.

It is possible to run out of system heap space when using a lot of public domain or commercial INITs. This may necessitate adjusting the system heap size. We cannot make a recommendation on what utility to use, but both Heap Fixer from CE Software and SUM Tools from Symantec seem to work fine.

For more information, search under: "CE Software" and "Symantec"

## GS/OS: Setting the Finder as the Startup Application

Revised: 8/28/90  
Security: Everyone

GS/OS: Setting the Finder as the Startup Application

=====

This article last reviewed: 7 August 1990

TOPIC -----

My school district has an Apple IIGS network.

I want to change the startup application from Aristotle to the GS/OS 5.0.2 Finder. I tried to set "Finder" as the startup and got an error, "Unable to load descriptor \$004E".

I set the appropriate permissions for access to the GS/OS operating system folder on the server, but I got the same error.

Can you help?

DISCUSSION -----

The \$004E error indicates that GS/OS attempted an invalid access procedure. There was only one way we were able to duplicate this error -- by denying access privileges to the Icons folder on the server. When the access privileges on the Icons folder weren't set to See Folders/See Files for everyone, the "Unable to load descriptors" message appeared. Descriptor refers to information stored in files within the Icon folder, which is needed by the Finder. Once we reset the Icon folder privileges so See Folders/See Files were allowed for everyone, startup proceeded normally.

Once access is granted to the Icons folder on the server and Finder is set as the startup application in the server's Admin program, the startup process should continue until you reach the Finder's desktop.

IMPORTANT NOTE: When using the "Icon Info" menu item from the GS/OS "Special" menu, there is one step that is sometimes forgotten. Be sure to press the "Apply" button while on the "Access" card of the "Icon Info" dialog box after making any changes to access privileges. If this button is not pressed, the changes are not recorded and the privileges revert to the previous settings.

## AppleShare PC 2.0.1: Use COMPAT.COM for Compatibility

Revised: 8/28/90  
Security: Everyone

AppleShare PC 2.0.1: Use COMPAT.COM for Compatibility

=====

This article last reviewed: 7 August 1990

TOPIC -----

I have a DOS machine with a LocalTalk PC Card running AppleShare PC 2.0.1, and I'm trying to run TCP/Connect through the card.

TCP/Connect was configured to run with AppleTalk; however, when running version 2.0.1 of AppleShare PC, I get an error that "AppleTalk was not initialized with the proper interrupt". TCP/Connect claims that this product worked with AppleShare PC 1.X.X, and that it uses interrupt #60.

Were the interrupts changed from version 1 to 2? If yes, what interrupt range can be used by the software?

DISCUSSION -----

It's not surprising that a product layered on top of the protocol stack in AppleShare PC 1.X wouldn't automatically work with AppleShare PC 2.0.1. Apple totally reworked the interface to make it more accessible to developers, and we changed the way we interfaced with MS-DOS. This includes the interrupts used.

There should be a relatively simple solution to the problem.

There is a program that ships with AppleShare PC 2.0.1 that tries to ensure compatibility with programs that layered on top of older versions of AppleShare PC. This program is called COMPAT.COM. You should run it immediately after you run ATALK.COM (most likely in a batch file). It intercepts the old style calls and reroutes them to the new API.

## MacX: Window Management Q & A (4/93)

Revised: 4/26/93  
Security: Everyone

MacX: Window Management Q & A (4/93)

=====

Article Created: 7 August 1990

### Article Change History

-----

04/20/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

Here are some questions and answers about MacX and window management.

### DISCUSSION -----

Q) Does the host machine send bitmaps or an object / vector description to the network? If bitmaps are sent, there may be some issues with network performance and cutting and pasting text.

A) Typically, an X client application sends information in the form of an object / vector description. For instance, when drawing a scroll bar, the bit image of the scroll bar is not transmitted, only the commands to generate the bit image are transmitted. However, it is quite possible for the client application to transmit bit images. A perfect example of this is a bit image viewing application.

Q) Does MacX always use the Macintosh Window Manager in rootless and rooted modes? I'm running Open Look under MacX in a rooted window, and I'm concerned about the implications of the Open Look interface being mapped onto Macintosh windows (although I can understand why this may have been done). I'm concerned also with consistency between machines. I have had some interesting problems with windows disappearing, use of menus, and so on (things that may be considered normal with the Macintosh interface). Interestingly, the calculator appears in a normal Open Look

window, but everything else is in Macintosh windows. My feeling is that the choice of rooted or rootless should define what happens (that is, whether Macintosh windows or Open Look windows are used).

A good example of the problem is when you iconify the clock. Normally, under Open Look, the time still appears and is updated--in MacX this doesn't happen. Is there a way that this can be configured to use Open Look windows (I am aware of the disadvantages), or will Macintosh windows always be used?

- A) When you execute a client application in a rootless window, MacX always maps the client's calls into the Macintosh Window Manager. When you use a rooted window, the Macintosh Window Manager is not used except to contain the entire "screen" or display that is being drawn into. If client applications are being displayed in Macintosh windows, the environment for the remote call is not being properly set. You need to set the display to the rooted window desired for each application you execute.

## Wang LPS/LIS-8 Laser Printer: Connecting to a Macintosh

Revised: 8/28/90  
Security: Everyone

Wang LPS/LIS-8 Laser Printer: Connecting to a Macintosh

=====

This article last reviewed: 9 August 1990

TOPIC -----

Can I connect my Macintosh systems to a Wang LPS/LIS-8 laser printer? If yes, please explain how to do this.

DISCUSSION -----

The LPS-8 printer technology is many years old and is not likely to be PostScript-compatible. Therefore, to print Macintosh files you would need a specialized driver -- and to our knowledge, none exist. Alternatively, if the printer is similar enough to other printers for which third parties like GDT provide drivers (HPs, daisy-wheel printers, and so on), you might be able to use one of those drivers along with a serial connection.

To initiate a print job when the Macintosh is emulating a Wang terminal is much more likely by using one of the terminal emulation products described in the Tech Info Library or in one of the AppleLink buyer's guides. However, we don't think this is what you are looking for, and you'd definitely lose the neat graphical and WYSISYG capabilities the Macintosh offers.

A third possibility is to translate the Macintosh file to a Wang file format to print on the LPS-8, but again you'd lose many of the advantages of the Macintosh.

## AppleShare PC 2.0.1: EtherLink II Problems

Revised: 9/27/91  
Security: Everyone

AppleShare PC 2.0.1: EtherLink II Problems

=====

Article Created: 9 August 1990  
Article Last Reviewed: 27 September 1991  
Article Last Updated: 27 September 1991

TOPIC -----

I'm using AppleShare PC 2.0.1 and the 3COM EtherLink II card (AT bus card).  
I'm trying to use a thick Ethernet external transceiver with the card.

Essentially, the card seems to be functioning, but it does not communicate  
with the network. I've also noticed that the NET.CFG file generates the same  
code for both thin and thick Ethernet.

Since AppleShare PC is supposed to support this card out of the box, I need  
some help. Do you have any suggestions?

DISCUSSION -----

There are several potential causes for problems with AppleShare PC and 3COM  
EtherLink II cards.

The most common is attempting to use Phase 1 services (usually after upgrading  
from AppleShare PC 1.x to AppleShare PC 2.0.x). Since AppleShare PC 2.0.x is  
Phase 2 only, you can only use it with Phase 2 services unless a router with  
both Phase 1 and Phase 2 drivers is present.

The card model is also important. 3COM has produced at least three different  
PC or AT bus Ethernet cards, all with the name EtherLink II. We are familiar  
with models 501, 503, and 505. The model 501 is an 8-bit card, quite old, and  
not supported. The model 503 is the most common, and what we wrote our  
EtherLink II MLID for. The model 505 arrived later and is a 16-bit card (AT  
bus only). We do not yet support this card. The 503 driver will not work  
with it because the model 505 is substantially more complex and full-featured.

Another reason could be that they are trying to load 3COM-supplied drivers

before loading AppleShare PC. This does not work. It prevents AppleShare PC from communicating with the network. Installing NetBIOS support will have the same effect.

Finally, the ENET3CII driver has problems when the bus speed of the PC is over 8MHz. The CPU speed can be greater, but the expansion bus speed cannot be above 8MHz. This is rarely a problem, but could be if you shift the PC into its non-turbo mode and things work.

A/UX 2.0: panic(vbwrite) Error

=====

Article Created: 15 August 1990

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I'm having problems with A/UX 2.0 and the Macintosh IIci.

I receive VB Write Error, at which point MultiFinder freezes up. I don't have to be doing anything with my system for this to occur. The systems configuration is as follows:

#### Hardware

-----

Macintosh IIci with HD80 SC and 8MB RAM  
EtherTalk NB Card rev L  
Apple external 160SC

#### Software

-----

A/UX 2.0

### DISCUSSION -----

The error you're seeing is probably "panic(vbwrite)".

This is a kernel panic error which occurred in the I/O buffer routines. The I/O buffer routines take care of reading/writing and freeing buffers within the UNIX kernel. In this case the kernel thinks the size of the available buffers are smaller than the amount of data that needs to be written out. In other words, you can't write out what you don't have. This is a very serious error,

which under normal circumstances should never occur.

The first thing to resolve the problem is to try a "kconfig -v -a /UNIX > kernel.conf" and have the output checked by an expert.

Let the same person look at a "module\_dump /unix"

## A/UX: EtherTalk Support and MacTCP Issues (9/94)

Revised: 9/7/94  
Security: Everyone

A/UX: EtherTalk Support and MacTCP Issues (9/94)

=====

Article Created: 15 August 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

I have heard that A/UX ships with EtherTalk already built into the kernel. Is this true?

If yes, how do I change the driver to run on the Macintosh IIfx and 1.2 to run on a Phase 1 network to update later revs to the driver?

I also noticed that MacTCP is shipped locked, and the MacX folders says not to add MacTCP Admin to A/UX. I did this anyway, so I could unlock MacTCP to change the IP addressing. This resulted in the system hanging.

After restarting, I tried newconfig with commando to turn on NFS and the Berkeley file system and restarted. The EtherTalk NB Card (rev K) did not get configured. I replaced MacTCP with a different, unlocked version, ran newconfig without commando, and the card was configured with no problem. I was using a Macintosh IIfx.

Why is MacTCP shipping locked? How do I make changes to it if I cannot use MacTCP Admin?

DISCUSSION -----

The AppleTalk for A/UX product, which could be ordered as a separate product for A/UX 1.1.1 and was rolled into the A/UX 2.0 and 3.0 release, is based on the new AppleTalk Phase 2 protocol specification but is in no way tied to any version of the Macintosh OS EtherTalk driver.

The Ethernet driver running under A/UX is completely different from the driver written to support the Macintosh OS. The driver for A/UX is called ae6; you add and remove this driver from A/UX via the newconfig(1M) command. This driver does not have the same problems that the Macintosh OS driver has with the Macintosh IIci and Macintosh IIfx and, therefore, does not require the same

revisions that the Macintosh OS driver needed.

There is no Ethernet support for the AppleTalk Phase 1 protocol suite. If you're using A/UX on an Ethernet and you want to use AppleTalk services, you must be attached to a Phase 2 network.

MacTCP for A/UX is a completely different version from the one we use under the Macintosh OSs. The version running under A/UX does not, and cannot, use the MacTCP Admin CDEV for configuration purposes. MacTCP running under A/UX gets all its configuration information from the kernel, making the Admin utility unnecessary. Use the `ifconfig(1M)` command to configure the IP network parameters under A/UX, or edit the `/etc/NETADDRS` file to change them permanently.

This shouldn't be necessary for a first-time installation since A/UX asks you for all configuration information it needs after you run the `newconfig(1M)` command to add an IP (`ae6/bnet/ae6`) network device driver to the kernel.

## Serial Cables: Extreme Length Can Generate Noise (11/94)

Revised: 11/21/94  
Security: Everyone

Serial Cables: Extreme Length Can Generate Noise (11/94)

=====

Article Created: 15 August 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I've connected a Macintosh SE to my MV15000 (Data General host) through the serial port using a cable wired according to the pinouts documented in the Tech Info Library.

When a terminal line is enabled, the host sends a "welcome" message to the terminal. If the Macintosh is not already in the terminal emulation program, the host receives arbitrary noise back on the line, causing the operating system to disable that port.

Can you shed any light on why this may be occurring, and where I could look for a solution?

DISCUSSION -----

When a Macintosh system is turned on and the System software is loaded, the transmit lines of the serial ports are in a high-impedance mode. This does not change until a terminal program, such as MacTerminal, is run.

Arbitrary noise back on the Macintosh transmit line could result if the cable is too long. The maximum serial cable length that the Macintosh supports is 50 feet. If the cable is longer than this, you may want to use short-haul modems.

You did not provide us with the pinouts that you're using. We are providing the following as a reference:

RS-422 and RS-232 Equivalents

-----

| Pin | RS-422 name          | RS-232 equivalent         |
|-----|----------------------|---------------------------|
| 1   | HSKo (handshake out) | DTR (data terminal ready) |
| 2   | HSKi (handshake in)  | CTS (clear to send)       |

|   |                               |                                                              |
|---|-------------------------------|--------------------------------------------------------------|
| 3 | TXD- (transmit data negative) | TXD (transmit data)                                          |
| 4 | GND (signal ground)           | GND (signal ground)                                          |
| 5 | RXD- (receive data negative)  | RXD (receive data)                                           |
| 6 | TXD+ (transmit data positive) | leave unconnected                                            |
| 7 | not connected                 | not connected                                                |
| 8 | RXD+ (receive data positive)  | must be grounded to pin 4 (on<br>Macintosh RS-422 connector) |

Article Last Updated: 4 November 1991

TOPIC -----

I have HP RuggedWriter 480 printers and Printronics P300 High-speed line printers. I want to use the Macintosh with a 4D database to print labels in mass volumes at high speed using the printer-resident font characters.

Currently, I have drivers from GDT (of Canada) that let me print to these printers from the Macintosh, but at very low speed.

- 1) Do you know of any drivers that work on these high-speed printers using the printer-resident font characters?
- 2) Do you know of any other printer and drivers that will do the job?

DISCUSSION -----

We know of three possible sources: GDT Softworks, Orange Micro, and Insight. Most support fonts built into printers, but none lists your specific printers in their product literature. Perhaps you should contact the printer manufacturers to discuss their specific requirements.

For more information, search the Tech Info Library under: "GDT Softworks", "Orange Micro", and "Insight".

## Macintosh IIfx: Xerox 7650 Scanner Termination (11/94)

Revised: 11/21/94  
Security: Everyone

Macintosh IIfx: Xerox 7650 Scanner Termination (11/94)

=====

Article Created: 15 August 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I have a Macintosh IIfx with HD80 SC and 4MB RAM (Quantum) running System software 6.0.5.

The Macintosh alone is functioning perfectly, but as soon I put on a Rank Xerox scanner 7650 and terminate with the black terminator, I am not able to start my system. The same scanner connected to a Macintosh IICx, terminated with the old terminator, is functioning perfectly.

Do you have any suggestions?

DISCUSSION -----

From your description, it sounds as if either the SCSI cables and terminators or the SCSI port on that Macintosh IIfx are bad -- or, much more likely, that there is an incompatibility between the Macintosh IIfx and Xerox 7650 scanner.

We contacted Xerox and found that this version of the scanner (having Macintosh and PC support) is distributed only by their VARs, and that Xerox will only support their VARs on this product. Because we were unable to get any assistance for you, we recommend the user contact the company that sold the scanner to see if there are new drivers or workarounds, and if not to escalate the problem through that organization and eventually to Xerox.

You also might try connecting another SCSI device or two on the same chain -- try in the middle or at the end.

## Macintosh Portable: Details About the Idle and Sleep States 9/95

Revised: 9/8/95  
Security: Everyone

Macintosh Portable: Details About the Idle and Sleep States 9/95

=====

Article Created: 15 August 1990  
Article Reviewed/Updated: 8 September 1995

TOPIC -----

How much of the Macintosh Portable gets turned off at Shutdown, and how much gets shut down when you sleep? I am particularly interested in RAM disks.

DISCUSSION -----

The Macintosh Portable has two power saving states: Idle (or Rest) and Sleep. Shutdown uses the same amount of energy as Sleep except when going into or coming out of a Shutdown state, when it requires more energy than Sleep for closing and saving files, and for bringing up the system and reloading the operating system when restarting. But while it is IN the Shutdown or Sleep state, the Portable will draw the same amount of electricity.

The Portable is considered idle after 15 seconds without any activity of any kind. The Portable is not considered to be idle if any of the following occurs:

- Any ADB routine other than routine monitoring of the bus
- Any I/O call to firmware (Read, Write, Control, Format, Status)
- Any change in the cursor (for example, the rotation of a hand in the clock icon)
- Any post-event call (for example, a call resulting from insertion of a disk)
- Any communication through the serial port

When the BatteryMonitor routine determines that the Portable is idle, it causes the CPU to insert 64 wait states into RAM and ROM accesses; this lowers the effective clock rate to approximately 1MHz. Interrupts continue to be processed at the full speed of the CPU.

After the Portable has been idle for the amount of time selected by the user, the BatteryMonitor routine puts the machine into the sleep state. When the Macintosh Portable goes into the sleep state, the Portable maintains full power to system RAM, video RAM, and the Power Manager IC.

The Power Manager IC stops the clocks to the SCC, the SWIM, and the ASC. By stopping the clocks to these devices, their power consumption is reduced to almost zero without requiring that they be reset, as would be necessary if all power were switched off. The Power Manager IC switches off power to the serial drivers, ROM, the flat-panel display, the ASC, the Sony sound ICs, the SCSI, and to a variety of pullup resistors and other components. The Power Manager IC sends a signal to the internal modem (if one is installed) that causes the modem to shut itself down.

After putting the rest of the system in the sleep state, the Power Manager IC does no processing except to monitor the 60HZ interrupt signal. Each time the 60HZ interrupt occurs, the Power Manager IC performs the following functions:

- It updates the real-time clock.
- It checks the wake-up timer to see if it matches the real-time clock.
- It checks the events that should return the machine to the operating state, such as a keystroke or a Ring Detect signal from the modem (when the modem feature has been enabled by the user).

The periodic functions take approximately 200 microseconds out of the 16.7 milliseconds between interrupts, so the Power Manager IC is inactive most of the time that the Portable is in the sleep state.

When the Power Manager IC determines that the wake-up timer matches the real-time clock or detects an event, it asserts the /RESET signal to the CPU, restores the clocks and power to other devices in the system, and then raises (deasserts) the /RESET signal.

## A/UX 2.0: Disk Space Value Depends on Login (6/93)

Revised: 8/12/93  
Security: Everyone

A/UX 2.0: "Disk Space" Value Depends on Login (6/93)

=====

Article Created: 19 June 1990  
Article Reviewed/Updated: 23 June 1993

TOPIC -----

We set up a 160MB disk with a 57MB Root&Usr and a 70MB Usr partition. The 70MB partition is automatically mounted by an entry in fstab. Everything works, except there seems to be a major discrepancy in available space reported by the Finder.

When logging in as root, the Finder reports 3MB free on the Root&Usr and 16MB on the Usr partition (after double clicking the directory specified as the mount point in fstab). When logging in as any other user, the Finder reports less than 1MB on the Root&Usr partition and 7MB on the Usr partition. Why the discrepancy?

DISCUSSION -----

The values you see for available free disk space (from either Finder or the "df" command), depend on whether you login as "root" or with a normal user (non-root) accounts. This is because A/UX 2.0 adopts UFS (Berkeley Fast File System) as the default root file system with minimum free-space threshold. UFS provides a mechanism that lets you specify the percentage of disk space RESERVED FROM USE by normal (non-root) users to reduce disk overhead and increase disk performance.

The percentage of space reserved for the Root file system shipped with A/UX 2.0 is about 5 percent, and the default percentage of space reserved for the non-root file system is 10 percent on the UFS file system. This is done via the -m option of the "newfs" command.

The point is that the root superuser has the privilege to see and use all free disk space, including the reserved space, but other users see only the AVAILABLE disk space.

If you really need some or all of the reserved disk space for normal use

and don't care about disk performance, use the `tunefs(1M)` command with the `-m minfree` option to change the percentage of the reserved space on an unmounted UFS file system. For example, the command,

```
tunefs -m 0
```

sets a UFS file system without free-space threshold. However, the disk performance (throughput) is significantly lower than performance at the default 10 percent threshold.

For more information on Berkeley UFS, refer to `newfs(1M)` and `tunefs(1M)` manual pages.

## StuffIt Deluxe: Use Commercial Version for Important Work

Revised: 8/28/90  
Security: Everyone

StuffIt Deluxe: Use Commercial Version for Important Work

=====

This article last reviewed: 26 July 1990

TOPIC -----

I use StuffIt 1.5.1 to archive large amounts of data. I made one large StuffIt archive (about 20MB). Later, I extracted and deleted some of the files in the archive, making the size about 8MB. Then, I tried to extract more files, but got the following message:

U-uh! The CRC-check for the resource fork has failed. Chances are that the file is trashed. Please use this file with caution.

This happens when StuffIt has almost finished extracting the resource fork. That seems reasonable, because that is the time for calculating the CRC. Sometimes, I'll get the error message above. Other times the machine bombs or just hangs. The message says that one should use the file with caution, but that is impossible, because StuffIt is unable to finish extracting the file. This happens with all the remaining files in the archive. I have tried to delete all files in the archive except one, but that does not help either.

I suspect that the error is caused by a media fault. The drive in question is a Bernoulli Box from IOMega, and the error has occurred only on the two cartridges that came with the drive. Later, I ordered at least 30 cartridges from the USA without any problems.

DISCUSSION -----

Sorry but we aren't familiar with StuffIt's error handling or bugs, nor are we familiar with this specific problem. The user might check with the programmer (name located on program's splash-screen) or the new distributor for any recovery routines they may have.

We generally caution users against using shareware software for critical work; you may wish to get the enhanced commercial StuffIt Deluxe. StuffIt Deluxe, a file compression, encryption, and file-archiving software. It is designed to

compress files (or folders) of all types into compact spaces, potentially saving 50 to 75 percent of hard disk space. You can also password protection (DES algorithms) any archive. StuffIt Deluxe works on 512KE or larger Macintosh running System 5.0 or later.

For more details, search the Technical Info library under "Aladdin Systems" or "StuffIt Deluxe."

## A/UX: TCP/IP Problem Configuration Solved

Revised: 9/24/92  
Security: Everyone

A/UX: TCP/IP Problem Configuration Solved

=====

Article Created: 28 August 1990

### Article Change History

-----

08/31/92 - REVIEWED  
o For technical accuracy.

### TOPIC -----

We have had a problem with A/UX and TCP/IP lines dropping. The problem configuration was:

```
IP: 192.31.38.69
Broadcast : 255.255.255.0
Netmask : 0
```

### DISCUSSION -----

The resolution to the problem is with the configuration of the /etc/NETADDRS file and the setting for the Broadcast address. The corrected configuration is:

```
IP: 192.31.38.69
Broadcast : 192.31.38.255
Netmask : 255.255.255.0
```

With this modification all line drops will be eliminated.

## Apple IIGS System 5.0: Setting Up an AppleShare Network (7/91)

Revised: 7/20/95  
Security: Everyone

Apple IIGS System 5.0: Setting Up an AppleShare Network (7/91)

Article Created: 14 August 1990  
Article Last Reviewed and Updated: 23 April 1991

TOPIC -----

I have been having problems adding Apple IIGS systems to an AppleShare network under Apple IIGS System Software Update Version 5.0. Can you give me some help?

DISCUSSION -----

The following information applies to Apple IIGS System Software Version 5.0 and later.

Because of recent rapid development of the Apple IIGS operating system, setting up an AppleShare network with IIGS systems can be confusing. For example, the Apple II Setup disk included with AppleShare Version 2.0.1, a Macintosh disk designed to install Apple II features onto the Macintosh file server, is now obsolete. You should use the Apple II Setup disk that comes with the Apple IIGS System Software Update Version 5.0 and later. If you do the AppleShare installation with the obsolete Apple II Setup disk from AppleShare Version 2.0.1, you get the following error message when you try to start an Apple IIGS over the network:

Cannot load (servername) /SYSTEM/SYSTEM.SETUP/CDev.Init.

To add IIGS systems to an AppleShare network properly under Version 5.0, you must buy the Apple IIGS System Software Update Version 5.0 or later. The update package includes the Apple II Setup disk and the manual "AppleTalk Network User's Guide for the Apple IIGS."

Setting up AppleShare on the Macintosh Server

-----  
Follow the steps below to set up AppleShare, so that IIGS systems start over the network.

- 1) Start up with the System Tools disk and run Apple HD SC Setup.
- 2) Initialize the server hard disk.
- 3) Name the hard disk using an Apple II convention; for example, "A2."  
(The shorter the name, the better.)
- 4) Install the Macintosh System Software on the server, making sure to use the latest version possible for your Macintosh computer.
- 5) Restart with the AppleShare Version 2.0.1 Server Installer disk. Install "AppleShare 2.0.1 Server" onto the server volume. Be sure you don't click any of the Macintosh-family installation scripts, because they will install old system software, overwriting the system software you just installed.
- 6) Restart from the AppleShare Server Admin disk and launch the Server Admin application.
- 7) Enter the administrator's key and password, name your server, and create the users and groups you need.
- 8) Choose Volume List from the Volumes menu and double-click the server volume. A dialog box allows you to set access privileges. Click all boxes and save enclosed folders.
- 9) Quit the Server Admin application and restart the Macintosh server from the Apple II Admin disk that came with the Apple IIGS System Software Update Version 5.0.
- 10) Launch the Installer program on the Apple II Admin disk, and install "Apple II Info" on the server volume; then quit.
- 11) Restart from the Server Admin disk and launch the Server Admin application.
- 12) From the Server menu, choose Server Info and click the Apple II feature. Then, click Save.
- 13) Choose Volume List from the Volumes menu and double-click the server volume. A dialog box allows you to set access privileges. Click all boxes and save enclosed folders.
- 14) Quit the Server Admin application and restart the server. Keep the server on-line while you perform the steps for the Apple IIGS.

#### Setting up AppleShare on the Apple IIGS

-----

Follow the steps below to set up AppleShare on the IIGS systems:

- 1) Start up with the System.Disk that came with the Apple IIGS System Software Update Version 5.0, and format a blank 3.5-inch disk.

- 2) Launch the System 5.0 Installer on the System.Tools disk.
- 3) In the Installer, select "AppleShare on 3.5 Disk" and install it on the formatted disk. (You'll have to do some disk swapping.)
- 4) Shut down the IIGS and restart from the AppleShare 3.5 disk you just created.
- 5) Enter the administrator's name (usually "Administrator") and password. On the Graphic Control Panel under the Apple menu, click the AppleShare icon and mount the server volume.
- 6) Launch the Installer program on the IIGS System.Tools disk.
- 7) Using the Command key (Open Apple), select the following scripts:
  - Latest Sys. Files (No Finder)
  - Server Network Startup
  - Server Quick Logoff
  - Optional scripts (Install the scripts that the IIGS systems starting up over the network will require; for example, the SCSI driver, 5.25 driver, LaserWriter printer, or AppleTalk printer.)
- 8) Install the selected scripts on the server volume. The system installs over the network, and the double-arrow icon at the top left of your screen flashes. You may have to do some disk swapping, and the installation may take a fair amount of time.
- 9) Once the installation is complete, quit and shut off the IIGS.
- 10) Shut down the file server and restart it from the Server Admin disk.
- 11) Launch the Server Admin application.
- 12) Select all users, or all Apple IIGS users who you want to be able to start up over the network.
- 13) Under the Apple II menu, choose Set Startup, and designate "Finder" as the startup application. (It will be located at /servername/System/Finder.)
- 14) When you're prompted for a response, allow the system to set the prefix automatically.
- 15) If the users you selected will be using a network printer, select Set Printer.
- 16) Choose Volume List from the Volumes menu and double-click the server volume. A dialog box allows you to set access privileges. Click all boxes and save enclosed folders.

17) Quit the Server Admin program and restart the file server.

18) On the IIGS units that you want to start up over the network, reset the startup slot from the Control Panel. Systems with ROM 01 should have the printer port set to "Your Card," Slot 7 set to "Built-in AppleTalk," and the startup slot set to "7." Systems with ROM 03 should have the printer port set to "Built-in AppleTalk," Slot 7 set to "Built-in AppleTalk," and the startup slot set to "AppleTalk."

(Note: If you have the newer model Apple IIGS with 1MB of RAM on the logic board, set Slot 7 to AppleTalk and EITHER slot 1 or slot 2 to AppleTalk.)

19) Restart the Apple IIGS. It now boots over the network and prompts you to enter a user name and password. Once you enter the name and password, the "progress thermometer" appears, and then you see the Apple IIGS System 5.0 desktop with the server volume icon at the top right.

## A/UX: The Event Manager and Mouse Events

Revised: 9/4/92  
Security: Everyone

A/UX: The Event Manager and Mouse Events

=====

Article Created: 28 August 1990

Article Change History

-----

08/31/92 - REVIEWED  
•For technical accuracy

TOPIC -----

I'd like to share a general observation, concerning A/UX and multitasking support while running the Finder.

While it is true that A/UX provides true pre-emptive multi-tasking for processes on the machine, it is also true that when the mouse button is held down, all activity appears to cease. The customer observation here is that the computer halts everything to deal with the mouse being down, and nothing seems to happen during this time.

What little I know about Macintosh development and priority queues tells me that StillDown events are taking precedence over screen update events. Therefore, the machine seems to stop. Although, in reality, it continues to process other tasks. Typical workstations have different priorities for user events, and, therefore, tasks continue to run and change their displays despite the actions of the user. Potentially, this could affect the responsiveness of the machine to the user, because user actions are not assigned any special priorities.

Is this is correct?

DISCUSSION -----

Your observations are correct. The Event Manager always returns the highest priority event waiting in the queue. When using A/UX, even though it looks like processing has stopped when you hold down the mouse button, it still is continuing to give processor time to other processes. This is handled by the A/UX scheduler process and falls outside the realm of the Finder shell.

The Event Manager priorities are defined as follows:

- 1) Activate (window becoming inactive is higher than window becoming active).
- 2) Mouse down, mouse up, key down, key up, disk inserted, network, device driver, application defined (in that order).
- 3) Auto key.
- 4) Update (in front-to-back order of the windows).
- 5) Null.

To demonstrate this, you could use the small shell script that follows:

- 1) Start up this process.
- 2) Let it count up to 10.
- 3) Press and hold the mouse button. The screen stops updating. The log file will continue to be updated (you will continue to hear the drive).
- 4) While still holding the mouse button down, press Control-C. Screen output from the program should be halted from the time you first pressed the mouse button down, somewhere around 10.
- 5) Open the log file (/tmp/junk.log). It shows that the file was being updated even though the screen was not.

#### C Shell Script

-----

```
#!/bin/csh
```

```
set counter = 1
```

```
while (1)
```

```
    echo "The counter value is " $counter | tee -a /tmp/junk.log
```

```
@ counter++
```

```
end
```

```
exit 0
```

## Macintosh Portable Data Modem 2400: Dialing Without Dial Tone

Revised: 7/28/92  
Security: Everyone

Macintosh Portable Data Modem 2400: Dialing Without Dial Tone

=====  
Article Created: 12 September 1990  
Article Last Reviewed: 28 July 1992  
Article Last Updated:

### TOPIC -----

We have had reports that the Macintosh Portable Data Modem 2400 cannot find a dial tone when plugged into an internal switchboard. The Hayes commands to do this, although accepted by the modem, seem to have no effect.

### DISCUSSION -----

Setting the active result codes with the X command tells the modem to:

- dial after a delay set by modem register S6, and
- not wait for a dial tone.

Use the following commands. You may or may not need to set register S6, depending on the phone system in use. The text in parentheses is comment only, and not part of the commands.

ATX3 (OK, CONNECT, RING, NO CARRIER, ERROR, CONNECT 1200 & 2400, BUSY)  
ATS6=3 (Wait 3 seconds. Default is 2, so this probably isn't necessary.)

Apple IIGS: Disabling the Control Panel

=====

This article last reviewed: 12 September 1990

TOPIC -----

How can I disable the Control Panel on the Apple IIGS?

DISCUSSION -----

The following is Electronic Learning Systems' description of Menu Master, a product that provides a way to disable the Apple IIGS Control Panel. For further information on ELS, search the Technical Information Library on "ELS".

"Menu Master is a simple menu system for the Apple II. It allows creation of customized menus and sub-menus to launch all ProDOS, GS/OS, and DOS 3.3 applications. Menu Master provides automatic pathfinding, simplifying the need to understand or manually set ProDOS paths. Menu Master has password protection, is mouse-compatible, and displays the time and date from any ProDOS clock. A utility feature enables or disables the Apple IIGS Control Panel.

"DOS 3.3 programs can now be launched and returned from, within the ProDOS operating system. DOS 3.3 software developers now have the ability to run DOS 3.3 programs on AppleShare or any ProDOS-specific environment.

"Any Apple II with 128K of memory and an 80-column display can now organize, launch and return from ProDOS, GS/OS, and DOS 3.3 applications with Menu Master. Apple IIc Plus systems can have 3.5-inch diskettes created with DOS 3.3 programs that will run on their computers.

"The network version of Menu Master is compatible with all Apple II networks including AppleShare, Corvus, ELAN, VELAN, and DIGICARD. Menu Master provides all the features of Apple's Aristotle program when used on AppleShare, but requires no memory expansion and can launch DOS 3.3 applications."

## Personal LaserWriter: Multiple Port Switching (11/94)

Revised: 11/21/94  
Security: Everyone

Personal LaserWriter: Multiple Port Switching (11/94)

=====

Article Created: 19 November 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

Is it possible for a Personal LaserWriter to switch printing sessions between the serial port and the LocalTalk connection without the user having to use the hard switch? The customer wants one printer that will work in both environments and is "smart" enough to spool documents from one side while printing on the other.

DISCUSSION -----

The Personal LaserWriter NT was not designed with the necessary intelligence to handle print jobs from both ports simultaneously. This would require an internal spooler that could queue print jobs from either port. It would probably also need to handle switching between PostScript and different emulations on the fly for this to be useful. You have two possible solutions: an external switching device or a different printer.

One such external device is a third-party product called BridgePort, by Extended Systems Inc. BridgePort lets any PostScript printer (including all of Apple's) accept jobs from a serial, parallel, or LocalTalk port. This external device automatically switches input to either a serial or parallel output to the PostScript printer. It is limited to accepting PostScript jobs only; it can't switch between HP and PostScript.

The LaserWriter Pro printers from Apple are capable of accepting print jobs from different ports without any additional hardware or software switching.

## AppleShare File Server: How To Set Unattended Restart

Revised: 9/29/90  
Security: Everyone

AppleShare File Server: How To Set Unattended Restart

=====

This article last reviewed: 13 September 1990

TOPIC -----

A customer needs to perform daily unattended restart of several Macintosh systems that are used customer as communications servers.

DISCUSSION -----

CE Software's QuicKeys and QuickTimer CDEVs should provide the solution.

QuickTimer can run a QuicKeys sequence called "Daily" at a specified time every day, or run a sequence called "Periodic" at regular intervals. From Finder or MultiFinder, define a QuicKeys sequence that does a Restart, and name it "Daily". The sequence needs a keyboard equivalent to be called by QuickTimer. Set the time you want the "Daily" sequence to be run, and restart the computer. The system should restart every day at the time specified in QuickTimer.

If the Macintosh Systems are AppleShare File Servers

-----

In this case, the setup is a little more complicated. There are six steps: patch the AppleShare file server software (please note that this patch is an unsupported solution), define four QuicKeys sequences, and use the Control Panel to choose a time.

Note: It's not necessary to patch AppleShare if the file server is a Macintosh IICx or Macintosh IICI, because you can lock the power switch in the ON position on these systems. With the power switch locked in the ON position, the Macintosh IICx and Macintosh IICI automatically restart after the Shut Down command is issued. This is not possible with Macintosh II and Macintosh IIX, because their power switches don't lock in the ON position.

Step A

-----

When Shut Down... is selected from the Server menu, the AppleShare file server closes all open files, writes information in the disk cache to disk, and shuts down the system. You need to patch the AppleShare file server software to just Restart instead of Shut Down.

The Shutdown Manager procedure is called ShutDwnPower, and it turns the computer off. If the Macintosh must be turned off manually (for example, a Macintosh SE), the Shutdown alert is presented to the user.

Disassembled, ShutDwnPower looks like this:

```
MOVE.W    #1,-(SP)    ;1 is the selector for the "ShutDwnPower" proc
_Shutdown
```

and in hexadecimal:

```
3F3C 0001 A895.
```

You need to have AppleShare call ShutDwnStart (the Shutdown Manager) instead of ShutDwnPower. ShutDwnStart restarts the system instead of turning it off.

Disassembled, ShutDwnStart looks like this:

```
MOVE.W    #2,-(SP)    ;2 is the selector for the "ShutDwnStart" proc
_Shutdown
```

and in hexadecimal:

```
3F3C 0002 A895.
```

Here's how to use ResEdit to make this change:

- 1) In ResEdit, open the application AppleShare File Srv (in the "Server Folder").
- 2) Open the CODE resources, find the 2 "Main" ID = 1 resource, and open it.
- 3) Select Find Offset... from ResEdit's Find menu.
- 4) Enter an offset of "512D" (a hexadecimal number).
- 5) "01" is highlighted in the CODE "Main" ID = 1 window. Type "02".
- 6) Select Save from ResEdit's File menu, and quit.

Here's how to apply the same patch using a file editor such as FEdit:

- 1) Use the file editor to open the application named AppleShare File Srv.
- 2) Search for the hexadecimal string "3F3C 0001 A895" (this occurs only once).
- 3) Replace the string with "3F3C 0002 A895".
- 4) Save the changes.

Now, the AppleShare file server will restart instead of shutting down when Shut Down... is selected from the Server menu.

(For more information on the Shutdown Manager, see pages 585 to 590 of Inside Macintosh Volume V.)

#### Step B

-----

Define a QuickKeys sequence that issues a Shut Down command:

- 1) With the AppleShare file server running, select QuickKeys from the Control Panel.
- 2) From the QuickKeys CDEV's Define menu, select Menu/DA....
- 3) From AppleShare's Server menu, select Shut Down.
- 4) Give this QuickKeys sequence a unique keyboard equivalent, perhaps Shift-Control-A.

#### Step C

-----

Define a QuickKeys sequence that enters the "Number of minutes until shutdown" into the time delay dialog:

- 1) From the QuickKeys CDEV's Define menu, select Text....
- 2) Type the number of minutes you want the AppleShare file server to delay before shutting down.
- 3) Give this QuickKeys sequence a unique keyboard equivalent, such as Shift-Control-B.

#### Step D

-----

Define a QuickKeys sequence that selects the OK button in the dialog:

- 1) From the QuickKeys CDEV's Define menu, select Buttons...
- 2) When a dialog asks you to "Enter button to look for", type "OK" and click on the OK button.
- 3) Give this QuickKeys sequence a unique keyboard equivalent, such as Shift-Control-C.

#### Step E

-----

Define a QuickKeys sequence that links all the above sequences:

- 1) From the QuickKeys CDEV's Define menu, select Sequences...
- 2) A dialog appears; on its right side are the three QuickKeys you already defined. On the left side is the default name "List". Change that name to "Daily".
- 3) Double-click the QuickKeys on the right side of the dialog in this order:
  - Shift-Control-A Shut Down...
  - Shift-Control-B '5'
  - Shift-Control-C OK
- 4) Click the "OK" button.
- 5) Give the "Daily" sequence a keyboard equivalent.
- 6) In the Control Panel, select the QuickTimer CDEV.
- 7) Click the word "Daily" so that the check box is selected, and set the time.

#### Step F

-----

- 1) From the Control Panel, Select the QuickTimer CDEV.
- 2) Click on the word "Daily", so that the check box is selected.
- 3) Set the time to, say, 4:30 am.

The AppleShare file server will now shut down and restart every day at the

defined time.

## Videodisc Control Stacks for CLV and CAV Formats

Revised: 12/22/95  
Security: Everyone

Videodisc Control Stacks for CLV and CAV Formats

=====

Article Created: 29 September 1990  
Article Reviewed/Updated: 22 December 1995

TOPIC -----

Does the APDA Videodisc Toolkit, which allows you to control a videodisc player from HyperCard, work with both CAV and CLV discs?

DISCUSSION -----

The command set of the videodisc player is the same for both CAV and CLV discs. This means that the Videodisc Toolkit will work with both type of discs.

However, there are differences in the discs that will not allow certain commands to provide useful results. Because the Videodisc Toolkit documentation states that the Toolkit does not specifically address CLV control, determining the controls that actually work with CLV discs is a matter of exploring. (Often, the videodisc player determines the available functions when using CLV discs. The player knows whether a CLV or CAV disc is loaded. Some functions are disabled by the player when CLV discs are in the tray.

Commands related to "frameMode" -- that is, "videoFrame()" -- do not work. Using "chapterMode" instead allows access to longer sections of video. The "playVideo" and "searchVideo" commands use chapter numbers rather than frame numbers when in "chapterMode".

Still-frame with CAV discs provides a crisp and clear still image. Attempting to freeze a frame from a CLV disc will not produce a stable image. This is a limitation inherent in the design and layout of CLV discs, not a limitation of the Videodisc Toolkit. CAV discs place one video frame per revolution of the disc; CLV discs place any number of frames within one revolution. One frame per revolution allows the disc to continue to spin with the laser reading head stationary, thus providing the same frame once per revolution. CAV discs have differing numbers of frames

from the outside edge of the disc to the inside of the disc. Holding the laser reading head stationary will not provide a stable image, because there is a variable number of frames/fields passing under the head in one revolution.

The Voyager Company markets "The Voyager VideoStack", which supports time mode with the CLV discs. This allows a stack to tell the player to go, for example, to "19 minutes 12 seconds" and begin playing until it reaches "21 minutes 32 seconds." This is not frame accurate, but in many situations provides sufficiently accurate control.

Voyager also provides "VideoStack 8000 Extension", which is for the Pioneer 8000 player. These extensions support special 8000 model features, such as true CLV still-frame and CLV frame search, digital sound control, and still-frame with audio. CLV still-frame is achieved through the use of the Pioneer 8000 digital frame buffer. The Pioneer 8000 can search to a particular frame and grab a frame of video into its digital buffer. This is different from the CAV method of still-frame.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

## ALAC (Any Language, Any Computer) Product Information

Revised: 9/29/90  
Security: Everyone

ALAC (Any Language, Any Computer) Product Information

=====

This article last reviewed: 18 September 1990

TOPIC -----

Is there a programming environment that allows programmers to use one language to write a host application that controls systems as diverse as Macintosh, IBM mainframes, DEC VAX, Cray, and IBM PCs?

DISCUSSION -----

United Data Corporation has announced a product that facilitates this process: ALAC (Any Language, Any Computer).

ALAC is a MacWorkStation-compliant MS-DOS application server that runs under MS Windows. A PC running ALAC responds to the same protocol messages as a Macintosh running MacWorkStation. This lets you build applications while your users remain on familiar hardware. You can use COBOL, Fortran, C, BASIC, or APL. Any computer that can run Windows can also run ALAC.

ALAC provides access to a graphical user interface. Programmers not familiar with Windows and the Macintosh can build applications for these environments, with full access to and control of dialog boxes, menus, and windows.

Single-user versions of ALAC are available through United Data or through APDA. Site licenses are available through United Data. For further information on United Data Corporation or APDA, search the Tech Info Library for the name.

## HyperCard and Multi-User Applications on Servers

Revised: 9/29/90  
Security: Everyone

HyperCard and Multi-User Applications on Servers

=====

This article last reviewed: 18 September 1990

TOPIC -----

Some customers have reported problems using HyperCard to open multi-user applications that are on a server. If they launch the application from a HyperCard script, they don't have multi-user access.

If they launch the application from the Finder, then use the HyperCard script to open a session with the application, they do have multi-user access. And if they launch the application entirely without HyperCard, they have multi-user access.

DISCUSSION -----

When you launch an application using HyperCard's Open command, it opens the application with privileges that lock the file. This prevents any other application, including the Finder, from launching the same application. HyperCard's Open command, therefore, can not multi-launch a single application.

There are ways to work around this. As mentioned, if you initially launch the application from the Finder, additional launches of the application from HyperCard do work, because it's the first application (in this case, the Finder) rather than HyperCard that sets the privileges of the open file.

You can also write an XCMD that does what the Open command does, except that you set the privileges for multilaunch in the XCMD.

Another option is to launch multi-user applications locally, rather than from the server. We've found that multi-user applications work faster when each Macintosh has a local copy of the application and accesses only the data file on the server. If the application is kept at the root level of each Macintosh, a HyperCard stack could launch the application locally, and

the application could get the data from the server.

If you don't want to have the application at the root level, you can:

- program each HyperCard stack with the access path to the application; or
- have the user tell HyperCard where the application is on the local disk (via the dialog that HyperCard shows if it doesn't know where an application is).

## Data Access Language: Problem Opening Rdb Databases

Revised: 9/29/90  
Security: Everyone

Data Access Language: Problem Opening Rdb Databases

=====

Article Created: 29 September 1990  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

A customer had a problem with DAL that prevents Rdb/VMS databases from being opened in certain cases. When they issue the OPEN DATABASE command

```
OPEN RDB DATABASE 'mydisk:[mydir.mysubdir]my_database'
```

the database can't be opened.

DISCUSSION -----

You always need to use the IN LOCATION or USE LOCATION statement to open databases that are not in the default directory. Although you might have been able to open databases by specifying the full path name with the database name in version 1.0, later versions (which support opening multiple databases simultaneously in Rdb) do not accept a full path name here.

## LaserWriter: Using Refilled Toner Cartridges

Revised: 9/29/90  
Security: Everyone

LaserWriter: Using Refilled Toner Cartridges

=====

This article last reviewed: 06 September 1990

Apple does not recommend the use of refilled toner cartridges because print quality may suffer as parts inside the toner cartridge wear out. Using refilled toner cartridges in your LaserWriter, LaserWriter Plus, LaserWriter II, or Personal LaserWriter printers may or may not cause damage. The impact on Apple printers is difficult to assess because it is impossible to predict the quality of refurbished cartridges.

The use of a refilled toner cartridge in your printer will not void a LaserWriter printer's limited warranty or an AppleCare contract. However, if printer failure is attributable to the use of a refilled toner cartridge, the damage resulting from this failure will not be covered under Apple's limited warranty or AppleCare contract.

The following is a reminder of which cartridges to use with your printer:

- The LaserWriter and LaserWriter Plus both use EP cartridges.
- The LaserWriter II uses EPS cartridges.
- The Personal LaserWriter uses EP-L cartridges.

## LaserWriter IINTX: How To Network a PS/2 and Macintosh Computers

Revised: 9/29/90  
Security: Everyone

LaserWriter IINTX: How To Network a PS/2 and Macintosh Computers

=====

This article last reviewed: 29 August 1990

You can connect multiple IBM PS/2 computers, Macintosh computers, and one Apple LaserWriter IINTX, so that all the computers are connected to the LaserWriter and using it simultaneously.

### DayStar Digital Solution

-----

The best solution is to use a LocalTalk MicroChannel card. The MicroChannel systems can be networked together using a AppleTalk card for the MicroChannel bus PS/2s by DayStar Digital (the LT200MC MicroChannel LocalTalk card). The card lets MicroChannel PS/2s communicate with other AppleTalk system components, like the LaserWriter IINT/NTX. The card comes with software for PS/2s to connect to AppleTalk printers, like LaserWriters. TOPS is reported to work with the card, too. AppleShare PC is reported to be incompatible with the DayStar card. For more details, search the Tech Info Library under "Day Star".

### 3COM Solution

-----

Another solution is to use the EtherLink MC PS/2 card from 3COM. This is a more complex solution, because it involves several components. This connects MicroChannel PS/2s to Ethernet. The PS/2s can print to a 3S200 server from 3COM and connect to a serially-connected LaserWriter II. The Macintoshes require an Ethernet interface card or Ethernet router to connect to the 3S200. 3COM servers do not support AppleTalk connections to LaserWriters and can only connect serially.

### Kinetics Solution

-----

If you can use a Kinetics FastPath with the EtherLink MC PS/2 product from 3COM (this depends on whether 3COM supports AFP), then the Macintoshes and the LaserWriter can be placed on LocalTalk cabling and be connected to the Ethernet PCs with the FastPath. This configuration does not need the Asynchronous LaserWriter driver for the Macintoshes.

PS/2 Notes

-----

There are six PS/2 models 25, 30, 50, 60, 70, and 80. Each model can also be bought in a different configuration. The low-end models 25 and 30 retain a PC and/or AT bus architecture that works with the Apple LocalTalk PC card.

## HyperCard: General Problems with XCMDs

Revised: 9/29/90  
Security: Everyone

HyperCard: General Problems with XCMDs

=====

This article last reviewed: 29 August 1990

Some XCMDs may cause system crashes or unusual problems to appear. These problems are usually results of poor programming.

When running a new XCMD, check the result of the command. Try placing this statement into the script after executing the command:

"Put the result into the message"

Here are some possible problems and their solutions when the system locks up:

- 1) The memory management system is purging needed data, because the XCMD has not taken precautions to protect it.
- 2) The XCMD has broken the master pointer block, and the problem is not uncovered until some random, future action.
- 3) The application stack has become fragmented causing an out-of-memory error, because the XCMD has allocated memory, locked it down, and has not removed the data after it was finished.
- 4) There just is not enough memory available.

There are several ways for XCMDs to crash. Almost all are due to bad programming and trying to use HyperCard in ways for which it was not designed. Anyone using an XCMD needs to test the XCMD in a stack by itself and slowly add and execute other XCMDs. Any one of them may be fragmenting the stack, corrupting the master pointer block, or using up memory by leaving data floating around.

Apple does not support extensions that are not part of the HyperTalk language. The ability to add extensions has been created so that programmers can enhance their stacks. However, each programmer must take the

responsibility to check for errors and report any problems to the user when writing the XCMD or XFCN. Programmers who are using extensions from unknown sources must take on the consequences.

Finally, a user's needs may not be appropriate for the capabilities of HyperCard. There are some supported XCMDs, like those available within legitimate HyperCard software products. We suggest HyperTalk programmers use only those XCMDs that they are confident with or that are supported if any future problems develop.

There are many other programming environments that support and handle advanced programming requirements. HyperTalk is not meant to be a replacement for programming languages like Pascal or C.

## HyperCard 2.0: New Product Features (1 of 2)

Revised: 9/30/90  
Security: Everyone

HyperCard 2.0: New Product Features (1 of 2)

=====

This article last reviewed: 30 August 1990

### OVERVIEW

=====

HyperCard 2.0 is the most-significant, major enhancement to HyperCard since the first version, which was introduced to the public in 1987. There are more than 40 new features in HyperCard 2.0. It runs on all Macintosh computers with the 128K or later ROM and 1MB of memory. Displaying multiple stacks and large cards in their entirety, and using the paint tools will require more memory. Here are a few of the main changes:

- Variable card sizes
- Multiple stacks open at same time
- Styled text in fields
- Runs existing HyperCard stacks with one-way conversion to 2.0 format
- Printing improvements
- Extended XCMD interface
- Enhancements to HyperTalk
- Modal script editor
- Debugging
- User-definable menus

### PRODUCT FEATURES

=====

#### Variable Card Size

-----

Previously, HyperCard supported only one card size (512 x 342). HyperCard 2.0 allows card windows from 64 x 64 to 1280 x 1280 pixels.

On the right side of the dialog, you can select one of seven possible standard window sizes from the Card size pop-up menu. You can change the card size any time, but all cards in a given stack are one size. If you reduce the size of a card, none of the fields or buttons that fall outside the new boundaries are lost, just hidden from view. The graphics will stay until they are edited by the paint tools or the stack is compacted, then they are clipped to the new

size. You can select a number of default settings for the screen size. These include:

- Small: 416 x 240
- Standard 9" 512 x 342
- Mac II 12" 640 x 480
- MacPaint 575 x 719
- Window 512 x 342
- Screen depends on monitor
- Custom 64x64 to 1024x1024

#### Multiple Stacks Open Simultaneously

Multiple Windows allow a user to have several stacks open at one time. There will be one window for each stack that is open. Users can have as many stacks open as available RAM space will allow. Only one window is allowed per stack and only one card from a given stack may be displays at the same time.

#### Text Enhancements

- **Styled Text in Fields:** HyperCard 2.0 lets a text field contain multiple fonts, styles, and sizes. The text can be changed by selecting the text and then choosing "Text Style..." from the Edit menu or selecting an item from the Font or Style menu. You can also find or set the attributes of any range of characters using HyperTalk.
- **Word Wrap:** Word wrap has been changed so only a space character will break up a word at the end of a line. In past versions, HyperCard would break any string with punctuation at the end of a line.
- **HotText** means that any text within a locked text field can be accessed by a number of new HyperTalk commands. This lets a HyperCard developer create stacks that respond to user mouse clicks in a text field. The commands are:

ClickText  
ClickChunk  
ClickLine

ClickText returns the text characters that were clicked. ClickChunk returns the range of characters. ClickLine returns the line that was clicked (e.g., Line 5 of card field 2).

You can use a "Group" style to override the standard grouping of text. This lets the stack creator join two or more words together and have them act as one word. When text is joined using Group style, the ClickText and ClickChunk change to return the combined words.

|           | Not Grouped | Grouped    |
|-----------|-------------|------------|
|           | -----       | -----      |
| ClickText | FINDER      | FINDER 5.3 |

ClickChunk          char 1 to 6 of cd field 3      char 1 to 10 of cd field 3

- Shared Background Text: lets designers enter text in a background field and have the text appear on every card of that background. In the past, text had to be "painted" on or entered in every card that used that background.

#### Printing Enhancements

-----

HyperCard 2.0 has improved printing abilities:

- Design custom reports for a single stack
- Create and save multiple reports for a stack (up to 7)
- Print fields
- Print the entire contents of a scrolling text field
- Print portions of a card
- Print the value of any HyperTalk expression using HyperTalk
- Print text field in same font as they appear on the screen
- Prints to non LaserWriter devices (fax modem)

When you print a report, you must specify the items to print in by using the menu items that come up when you select Print Report. These items are no longer in the Print Reports dialog box.

## Macintosh SCSI Termination: A Brief Explanation

Revised: 9/30/90  
Security: Everyone

Macintosh SCSI Termination: A Brief Explanation

=====

This article last reviewed: 31 August 1990

TOPIC -----

Is the Macintosh SCSI connector terminated on the logic board? In other words, are both ends of the chain terminated or only the last peripheral?

DISCUSSION -----

The Macintosh systems that have SCSI ports are not terminated on the logic board. One system, the Macintosh IIx, when shipped without an internal hard drive, comes with a terminator plugged into the internal SCSI connector. If an internal hard drive is installed in a Macintosh system, it should be terminated. The internal hard drive is the first device in a SCSI chain. The last device in the SCSI chain should also be terminated.

Typically, a Macintosh system with only one SCSI device needs only one terminator. The exception to this is the Macintosh IIx when it has a single SCSI device attached on the external SCSI connector. In this case, there should be the internal terminator that came with Macintosh IIx and a terminator on the external SCSI device.

Macintosh Pascal Discontinued but Supported: Update

=====

This article last reviewed: 31 August 1990

TOPIC -----

Is there a product called MacPascal? If yes, what is the latest version, and is it an Apple's product?

DISCUSSION -----

Macintosh Pascal was discontinued many years ago. The latest version shipped by Apple was version 2.1. Although we no longer ship it, we continue to support the product (though we rarely get any questions on it since most people have migrated to newer products).

There are many substitutes, including Think Pascal from Symantec, which could be used in conjunction with an interactive tutorial called Just Enough Pascal, also from Symantec (these, as well as others, are described in the buyer's guides on AppleLink).

We'll update the article "Macintosh Pascal Is Discontinued But Supported" in the Tech Info Library with this information.

Macintosh Portable: RAM Consumes Insignificant Power

=====

Article Created: 31 August 1990  
Article Last Reviewed: 30 July 1992  
Article Last Updated:

TOPIC -----

Is there a significant decrease in battery life for a Macintosh Portable with 2MB of Apple Portable RAM as compared to one with 1MB? Also, does the extra 1MB of Apple Portable RAM drain the battery during "Shut Down?"

DISCUSSION -----

When the Macintosh Portable is in a "Sleep" or "Shut Down" state, having 1MB of RAM draws 4.5mA, and adding another 1MB in the RAM expansion-card slot raises the total draw to 6mA. Though we haven't tested the longevity of the battery with the additional 1MB of RAM, it should have a very minimal effect.

When the Macintosh Portable is active, the RAM power requirements are approximately 20 to 35mA with 1MB or 2MB of RAM installed, respectively. This power draw is relatively insignificant, a mere increase of 15mA, as compared to the 200mA the logic board draws, 50 to 70mA for the display, and 700mA for the hard drive.

Of course, this applies to Apple's Portable RAM expansion, because third-party RAM boards may use different kinds of RAM with different power consumption characteristics.

## Macintosh Portable: SCSI Termination Problems (1/95)

Revised: 1/19/95  
Security: Everyone

Macintosh Portable: SCSI Termination Problems (1/95)

Article Created: 31 August 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I have a Macintosh Portable to which I have connected separately either an Apple Tape Backup or external hard drive. In either case, the presence of the SCSI device crashes the SCSI system even though it is terminated correctly.

Could it be that the Macintosh Portable and other new Apple systems do not generate the initial termination due to a change in the CMOS chip?

DISCUSSION -----

There are no known problems using Apple's external SCSI hard drives or the Apple Tape Backup on the Macintosh Portable. However, because the Macintosh Portable doesn't provide termination power (to limit demands on the battery), external SCSI devices connected to the Macintosh Portable must provide that power. That is, they must be powered on and left on while using the Macintosh Portable. Also, the Macintosh Portable should be shut down when connecting or disconnecting peripherals.

We don't know your Macintosh Portable configuration, the software used, the software versions, the events leading up to the error, or what the error was, but what is described above about termination power is common enough that it bears repeating.

If by "initial" termination you mean that the Macintosh Portable does not have "built-in" termination, it is just like all other Macintosh systems except for the Macintosh IIfx. They are internally terminated.

Macintosh: How to View GDDM Files on Host

Article Created: 31 August 1990  
Article Reviewed/Updated: 26 July 1993

TOPIC -----

I want to view GDDM files using a terminal application (with board or preferably Ethernet-supported) for 3192G or 3279G terminal types. Can you help?

DISCUSSION -----

The latest release of DCA's (formerly Avatar) MacMainFrame product supports both features you want. It provides APA (All Points Addressable) graphics, and it distributes sessions across AppleTalk to other Macintosh systems on the network. Because the product emulates a 3279 terminal with APA graphics, you can use GDDM on the host to display graphics on the Macintosh.

Because you mentioned Ethernet as a preferred connection, we assume you're looking for a TN3270 solution. We haven't used it personally, but we understand that the latest TN3270 product from Brown University Computing and Information Services supports several IBM graphic terminals (3179G, with GDDM support).

Also, you might want to contact Wollongong with regard to their MacPathway TN3270 product. To locate a vendor's address and phone numbers, use vendor name as a search string.

## Fiber Optic Network Developers

Revised: 7/27/93  
Security: Everyone

Fiber Optic Network Developers

=====

Article Created: 30 September 1990  
Article Reviewed/Updated: 27 July 1993

TOPIC -----

Do you happen to know of sites in the U.S. or Europe where fiber optics are being tested or used as the transport media in a LAN of Macintoshes and possibly PCs?

DISCUSSION -----

Although we don't know of any devices that bring fiber optics into the Macintosh (for example, a fiber optics NuBus card), there are numerous companies that offer Ethernet-, Token Ring-, and LocalTalk-to-Fiber Optics transceivers. So a network could look like:

```
Macintosh<-->LocalTalk<-->transceiver<-->fiber<-->transceiver<-->
EtherTalk<-->Macintosh
```

Just a few of the companies offering such products are Berg Electronics (formerly DuPont Electronics), Network Resources Corporation, and SynOptics. Other similar devices are readily available from network-product suppliers like Black Box Corp. Routing AppleTalk over that medium is not a problem. Additional information on these companies can be found in the Technical Info Library.

A significant number of corporations, universities, and government agencies are using (or experimenting with and preparing to use) fiber to some degree. For information on established networks with particular characteristics, contact the vendors of the products you are considering.

Article Change History:  
27 July 1993 - Company title changed from DuPont Electronics to Berg Electronics.

## AlisaShare: User Limit around 62

Revised: 9/30/90  
Security: Everyone

AlisaShare: User Limit "around" 62

=====

This article last reviewed: 5 September 1990

TOPIC -----

I have the following configuration:

- DEC VAX 6000 series running VMS 5.3 PCSA and AlisaShare
- All-Ethernet environment

The VAX is dedicated to desktop services, including file and print sharing. When more than 62 users log on to the VAX using AlisaShare, the process locks up and must be restarted. Even when this limit is approached and users log off, the process remains locked. The VAX is currently serving over 200 Macintosh and MS-DOS systems.

I spoke with Alisa Tech Support and was told the limit for AppleShare in general was 62 users and could not go beyond that. They suggested starting a second Alisa Process to cover additional needs, but I am reluctant to do this because of the extra time needed to administer it.

I know of the 50-user limit of Apple's AppleShare server software and the 254-node limitation of AppleTalk Phase 1, but not of a maximum limit of 62 simultaneous users.

Do you know of any such limitation? If yes, is there a workaround? If not, what could be the source of the problem?

DISCUSSION -----

We contacted Alisa Technical Support and they told us that AlisaShare has a user limit of "around" 62 users. This is not an AppleShare limit. Starting another process is the only way we know to work around this problem.

Data Access Language (DAL) and Distributed Sessions

=====

Article Created: 30 Septemmbber 1992  
Article Last Reviewed: 9 July 1992  
Article Last Updated: 9 July 1992

TOPIC -----

I am very interested in the Data Access Language, especially in relation to a DB2 database. Does DAL support accessing the IBM mainframe via distributed-session, 3270-connectivity products like Avatar's distributed session product or Tri-Data Netway?

DISCUSSION -----

Data Access Language (DAL, formerly CL/1) uses a connection definition in the hosts.cl1 file when making connection to a DAL host server. The following mainframe interfaces are currently supported by DAL:

- MacDFT 1.1 with Apple Coax/Twinax Card connection
- MacDFT 1.1 with Apple TokenTalk NB card connection
- MacDFT 1.1 with Apple Serial NuBus Card Connection
- Tri-Data Netway 1000/2000 connection
- Avatar MacMainFrame connection
- DCA MacIrma connection

CVT and DFT sessions are supported byt all these connection methods.

## A/UX: How It Handles Multiple Monitors and Function Keys (9/94)

Revised: 9/23/94  
Security: Everyone

A/UX: How It Handles Multiple Monitors and Function Keys (9/94)

=====

Article Created: 5 September 1990  
Article Reviewed/Updated: 23 September 1994

TOPIC -----

I have some problems with A/UX:

- 1) Since A/UX supports only one monitor, which monitor will A/UX use on a Macintosh SE/30 with an external monitor (RasterOps)?
- 2) The command shell in A/UX uses a VT100 definition in the termcap file. How are the VT100 keys mapped to the Apple extended keyboard (like the VT100 keypad, PF1-PF4)?

DISCUSSION -----

A/UX uses only the internal monitor when running on a Macintosh SE/30. A/UX running on a Macintosh II class machine will always use the video card installed in the lowest number slot.

The PF1 through PF4 function keys on the extended keyboard are supported under the A/UX 3.0 CommandShell terminal emulation. Use the "Keys" pull down menu.

## A/UX 2.0: How to Protect the Macintosh OS Partition

Revised: 9/4/92  
Security: Everyone

A/UX 2.0: How to Protect the Macintosh OS Partition

=====

Article Created: 30 September 1990  
Article Last Reviewed: 31 August 1992  
Article Last Updated : 31 August 1992

TOPIC -----

I want to put in a lab of A/UX systems to teach UNIX on. In A/UX 2.0b9 I found a hole for lab use. That is, you can boot A/UX; log in as guest, root, or regular account; and throw away the System folder from the Macintosh OS boot partition. If the system is then powered down, it can't be restarted. This is a serious problem for public-access types of facilities. Is this also in the final?

DISCUSSION -----

This problem remains in the released version, but here's a temporary solution:

- 1) Format the A/UX drive using SilverLining from LaCie.
- 2) Password protect the Macintosh OS partition using SilverLining.
- 3) Put only a System file and the A/UX Startup application on the Macintosh OS side. NO Finder should be put on the Macintosh OS side.
- 4) Set A/UX Startup as the startup application after you have started up from a floppy or another disk.

A/UX 2.0 will not recognize the password-protected disk and will not mount it. Because the Macintosh OS side has only a System file and the A/UX Startup application, no one can short-circuit the boot into A/UX and mess with the Macintosh OS files.

However, two possibilities remain for tampering with the Macintosh OS side. Making a bootable floppy that has a Finder on it from A/UX could be troublesome. A clever hacker could use "dp" to remove the password protection on the Macintosh OS side. However, proper file protections could

stop this sort of thing. You might also have to protect power switches.

In A/UX 3.0, A/UX Startup includes a password feature that can make the MacPartition unavailable to all users except root.

AFE: Incompatibility with A/UX 2.0

=====

Article Created: 6 September 1990

### Article Change History

-----

08/31/92 - REVIEWED  
•For technical accuracy

### TOPIC -----

AFE (under A/UX 2.0) fails to initialize DSDD disks as MS-DOS 720K, with the error "Initialization Failed!" The same disks formatted fine on an MS-DOS machine, another Macintosh running AFE, and the same A/UX Macintosh booted under Macintosh OS. The results were the same on several different disks regardless of whether DOS Mounter was running or not.

### DISCUSSION -----

AFE isn't completely compatible with A/UX 2.0, although formatting 720K DOS disk was the only problem I found with it. It would mount and translate both 720K and 1.44MB DOS disks with no problems.

## LaserWriter: Remote Status Feedback (11/94)

Revised: 11/21/94  
Security: Everyone

LaserWriter: Remote Status Feedback (11/94)

Article Created: 6 September 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I am using the LaserWriter IINTX in PostScript batch mode, attached to a Hewlett-Packard workstation. The printer's location makes it impossible to see the status lights. Can one write a program to read the status and notify the user of a condition requiring operator intervention?

What is the difference between "PostScript batch" and "PostScript interactive" modes? Would "PostScript interactive" give me the capabilities I need? Are these modes described anywhere?

DISCUSSION -----

PostScript batch mode is the mode to use. To quote page 275 of the PostScript Language Reference Manual (available from Addison-Wesley):

"In batch mode, a job consists of the execution of a single file containing a PostScript program."

The manual goes on to say:

"In interactive mode, a job consists of an arbitrarily long dialogue in which the user issues a PostScript statement and the server executes the statement and prompts for the next one."

Page 282 of the manual discusses status queries:

"The LaserWriter provides a status query facility that enables the host or user to determine what the LaserWriter is doing. The LaserWriter responds to a status query asynchronously with respect to normal job execution; that is, it sends a response immediately, regardless of what has gone on before or how much input data has been buffered. This facility is intended primarily to enable 'spoolers' (printer control programs) to keep track of the activities of

LaserWriters under their control."

"The status query mechanism works differently depending on whether AppleTalk or serial communications is in use, but the syntax and semantics of the response are the same in either case."

"In case of AppleTalk, a request to open a connection to a busy LaserWriter yields a rejection packet whose data consists of a status message. There is also a separate status request packet that yields the same information. The path over which the status response packet travels is logically separate from the connection through which the server is receiving its current job."

"In case of serial communication, receipt of a control-T character from either channel (9-pin or 25-pin connector) elicits a one-line status message over the same channel. This channel need not be the one through which the server is receiving its current job. The message is bracketed by the text sequences '%%[' and ']'%' to enable host software to extract the message from ordinary data generated by the job being executed."

## A/UX 2.0: Slot Manager and Device Drivers (6/93)

Revised: 8/12/93  
Security: Everyone

A/UX 2.0: Slot Manager and Device Drivers (6/93)

Article Created: 7 September 1990  
Article Reviewed/Updated: 17 June 1993

TOPIC -----

I want to use a NuBus accelerator card (MacDSP) with A/UX 2.0. I got it to work under the Macintosh OS. However, when I try to get it to work under A/UX, the software says that it cannot find the device driver for the DSP NuBus card. What needs to be done to get A/UX to recognize this? Do I need to write a custom device driver for A/UX? Why does Apple map serial applications like MacTerminal correctly through the /dev/tty driver and not map SCSI devices and/or NuBus boards (Slot Manager)?

DISCUSSION -----

Yes, a NuBus card used under A/UX must have a device driver written for it, or it will not be recognized as a valid device, and it will not function. Actually, this is similar to what we have in the Macintosh OS. For example, a .ENET driver is installed in the System file when you use the Macintosh II EtherTalk NB card, and the Apple TokenTalk NB card requires A/ROSE to function.

Therefore, although the Slot Manager provides the basic functionality of recognizing and communicating with NuBus cards at system startup, it is actually the manufacturers' software that initializes the cards and lets the system use them. This software uses the Slot Manager to integrate the cards into the Macintosh OS.

Although it provides excellent Macintosh OS compatibility, A/UX 2.0 cannot provide this low-level hardware communication in the same fashion as the Macintosh OS and remain UNIX. UNIX uses device drivers of a particular format to communicate with hardware, and just as we have had to do with the NuBus cards we support, manufacturers wishing their cards to work with A/UX must either support Apple's drivers (as in third-party video cards) or write their own.

## MacDFT, TokenTalk, and Error 32804

Revised: 9/30/90  
Security: Everyone

MacDFT, TokenTalk, and Error 32804

=====

This article last reviewed: 7 September 1990

TOPIC -----

I am having problems with a Macintosh IIci with Apple TokenTalk NB card and MacDFT hooked to an IBM host running TSO. When I call up MacDFT 1.1, I set my terminal type to Model 3, then begin to log on. After typing my log on and password, a dialog box appears:

Session 1: Request 14: Error 32804

I can log on and run terminal sessions just fine, but this error message may appear one more time during the session. The manual gives no indication of what this problem may be.

Another, and possibly related, symptom is that file transfer, which worked fine under version 1.0, does not work; the file transfer always times out at the file transfer dialog box. Any suggestions?

DISCUSSION -----

We suspect that both of these problems are being caused by an improperly configured Log Mode Table on the host. Specifically, we are looking at the PSERVIC field in the Log Mode Table that has the following format:

|    |    |           |      |      |    |                       |
|----|----|-----------|------|------|----|-----------------------|
| 02 | 80 | 00000000  | 2050 | 1850 | 7F | 00                    |
|    |    |           |      |      |    |                       |
|    |    | reserved  |      |      |    | reserved              |
|    |    |           |      |      |    |                       |
|    |    | Query bit |      |      |    | Screen Size Switch    |
|    |    |           |      |      |    |                       |
|    |    | LU Type   |      |      |    | Alternate Screen Size |
|    |    |           |      |      |    |                       |
|    |    |           |      |      |    | Default Screen Size   |

Where:

- 1) LU Type is the device type. 02 is a display device.
- 2) Query bit determines file transfer ability. You need the first digit of this byte set to 8 or higher to enable DFT file transfer.
- 3) Default Screen Size and Alternate Screen Size are values determining the terminal model being used. The following table shows the possible settings:

|         |      |
|---------|------|
| Model 1 | 1828 |
| Model 2 | 1850 |
| Model 3 | 2050 |
| Model 4 | 2B50 |
| Model 5 | 1B84 |

- 4) Screen Size Switch sets your ability to switch between the default and alternate display types. If this is set to 7F, you can. If it is set to 7E, you cannot.

In your case, we suspect that the Query bit and Default Screen Size fields need to be reset, based on the functionality you desire. It is quite likely that the settings are still those used when MacDFT 1.0 was being used through a Coax/Twinax card in CUT mode.

## Macintosh-to-NCR ITX Connectivity

Revised: 9/30/90  
Security: Everyone

Macintosh-to-NCR ITX Connectivity

=====

This article last reviewed: 7 September 1990

TOPIC -----

Can a Macintosh communicate with an NCR System 10000 running ITX operating system? If so, can this software control file transfer to a specific disk on the NCR system? If not, do you know of a third-party software package that provides either or both of the capabilities? This request involves a school district decision regarding the use of Macintosh as administrative computers and front ends to their NCR mainframe.

DISCUSSION -----

We contacted the local NCR office to find out what was required in connecting to an NCR system running ITX. They said that a dumb terminal (MacTerminal in VT100 would work) was all that was required for one session. There is special software for the PC world (ITX Windows for PC) that allows multiple connections to the system, but we have been unable to find information on a Macintosh version. The local engineer suggested that you contact Central Dispatch at their local NCR office for detailed information on what is required for their particular system.

Further, we found the following software in the Macintosh Buyer's Guide on AppleLink:

MacQT - Macintosh terminal emulation and file transfer

MacQT (Macintosh Quick Terminal) provides emulation of an ADDS Viewpoint (a.k.a., NCR 7901) and NCR 7900 connected to an NCR host running UNIX or NCR's ITX or other operating system. It lets a user run any program on the host system, just as though they were working on a dumb terminal. Emulation is fast and thorough. MacQT will transfer, in either direction, sequential ASCII files or spool (print out) files. Host software is provided where necessary for file transfer. Contact Rasmussen Software, Inc (check the Technical Info library for details) about MacQt.

## MacTerminal: Eliminating the X0 Command

Revised: 9/30/90  
Security: Everyone

MacTerminal: Eliminating the X0 Command

=====

This article last reviewed: 7 September 1990

TOPIC -----

I have discovered that MacTerminal sends out a command that is not always accepted by the telephone company. If you do the automatic dialing, using Dial in the Phone menu, the Macintosh sends the following:

```
ATS0=0 E0 V0 X0 H0 cr
AT cr
ATDT number cr
```

The problem is the X0. This puts the modem in a "blind dial mode." In other words, the modem does not wait for a dial tone before it starts to dial. This doesn't always work, depending on what kind of telephone system there is.

Is there any way of changing this command sequence, so that MacTerminal doesn't send X0?

DISCUSSION -----

To change the X0 in MacTerminal's dial string to an X2 or X4 requires the use of a file editing utility such as FEdit or SEdit. Make a working copy of MacTerminal first, and open it from the utility. Do an ASCII search for "ATS0" (the 0 is a zero). Within one block, there should be two occurrences of "ATS0=0E0V0X0H0". Edit the "X0" to "X2", being careful not to add any extra text. Write the sector back to disk.

It would also be a good idea to modify MacTerminal's version resource, so that users can easily tell this copy has been modified. Using ResEdit, open MacTerminal's vers resource ID#1. Modify two strings as follows:

```
Abbreviated string "2.3.1"
Change it to        "2.3.1.x2"
```

## ..TIL06096-MacTerminal-Eliminating\_the\_X0\_Command\_(TA44556).pdf

```
Get Info string "2.3.1 Copyright c Apple Computer, Inc. 1983-1989"  
Change it to    "2.3.1.x2 Copyright c Apple Computer, Inc. 1983-1989"
```

Remember that this is an unsupported patch, and could cause problems if MacTerminal encounters result codes it doesn't expect. By changing the X0 to X2 or X4, you immediately expand the set of result codes that MacTerminal may see. If it doesn't handle these well, the results can be unpredictable.

## Microsoft Word: Repairing Corrupted Documents

Revised: 9/30/90  
Security: Everyone

Microsoft Word: Repairing Corrupted Documents

=====

This article last reviewed: 7 September 1990

TOPIC -----

I have designed a table/chart in Microsoft Word 4.0. Superpaint 2.0 was used to rotate some of the headings and insert large bullets.

When printing the document, I get the beginning of the table in Palatino (the desired font) and Helvetica, but later in the document the Palatino font is being replaced by Courier. I checked "no font substitution," but got the same result. The chart printed fine with LaserWriter 5.2, but this problem occurs with LaserWriter 6.0 or above. What happened with the new version of the driver?

DISCUSSION -----

When we printed your document here, it printed incorrectly every time--not only with LaserWriter 6.0 and 6.0.1. This suggests that the problem is some type of file corruption.

When a Microsoft Word file is corrupted, Microsoft suggests saving the file under a different name in RTF format, closing it, opening it again, and saving it again in regular Microsoft Word 4.0 format. When opening the RTF format file, Microsoft Word will ask if you would like to convert the file from RTF to regular Microsoft Word format. Say yes. This process will take a few minutes.

We tried this process with the file you sent, and all tables in the document printed with the correct font (Palatino).

A/UX 2.0: and dbm.h

=====

Article Created: 7 September 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy

### TOPIC -----

I am working with a Macintosh IIfx with HD80 SC and 8MB RAM and A/UX 2.0 Golden. My group is currently operating an AT&T System V system and evaluating A/UX as a replacement for their current system. As part of this evaluation, we are taking their code and re-compiling it under A/UX 2.0. All of these questions concern the operation of the dbm function under A/UX 2.0.

- 1) Because dbm.h redefines null, it is a problem using standard I/O calls. Any workarounds available?
- 2) The dbm.h file lists several functions not described in the manual such as:
  - makedatum
  - calchash
- 3) The fetch function under dbm is described in the manual to return a pointer to data. However, in the dbh.h file, it is described as returning the data itself. Which is true?

### DISCUSSION -----

- 1) dbm.h redefines null to be a pointer instead of just 0, but nothing says that you can't redefine it yourself within your function that wants to use standard I/O library calls. Or redefine your own NULL and use it as your NULL reference. Without specific examples, it's hard to give you a specific workaround.

2) Anything you find in a header file that is not documented or obvious as to its function is usually an internal declaration used for the program itself. This is the case with the extra function declarations in the dbm.h file.

3) The fetch function returns the data itself, not a pointer to it.

## ATalk Phase 2: Extracting Zone Multicast Addresses

Revised: 9/30/90  
Security: Everyone

ATalk Phase 2: Extracting Zone Multicast Addresses

=====

This article last reviewed: 7 September 1990

TOPIC -----

I manage a large Ethernet network supporting Macintoshes and VAX systems. To manage the network traffic, we want to install filtering bridges to contain multicast packets within defined parts of the internet.

I understand that the Ethernet destination address for AppleTalk Phase 2 isn't broadcast, and zone multicasts are supported. How do you get access to the zone name/multicast address mapping for the Internet, as this is held within the bridges in the ZIT (Zone Information Tables)? We would need to dump the ZIT so that the bridge can be configured, but I can't find any utility that will extract the zone table from the Internet router. Do you know how this can be done?

DISCUSSION -----

There are no utilities that we know of to extract the zone multicast address from the routers of AppleTalk Phase 2 networks. You could use any of the new Macintosh-based Ethernet monitor programs (EtherPeek from the Avant Garde Group or Netminder from NEON Software) to extract the information.

There may be some problems even after you have the data. Zone multicast addresses are assigned on a dynamic basis, using an algorithm that gets the seed number of the multicast address from the zone name itself. If the zone names were changed, the multicast address could also change. There is also a problem where different zones can be assigned the same multicast address, in which case if you blocked one zone you would block all zones that are assigned to that multicast address.

I think you will find a small savings in packet traffic for the amount of work involved in setting up this non-standard approach to segmenting their network. Zone multicast traffic accounts for only a very small amount of the over all traffic present on the net. If you really want to segment your traffic, look

at installing some Ethernet-based routers instead of the bridges. Routers are a much cleaner way of isolating network traffic in such situations.

You could also program their bridges to isolate all of the AppleTalk multicast addresses; the addresses start at 0x090007000000 and end at 0x0900070000FC. 0x0900007FFFFFFF is also used as the general AppleTalk broadcast address.

Hard-Disk Recovery: Third-Party Products

=====

Article Created: 30 September 1990

### Article Change History

-----

1/20/93 - UPDATED  
• Vendor information.  
9/10/90 - REVIEWED  
• For accuracy.

### TOPIC -----

What do you recommend for recovering data from a "soft-crashed" hard-disk?

### DISCUSSION -----

We know of three disk recovery packages. We have used Symantec Utilities for the Macintosh II from Symantec and The Norton Utilities for the Macintosh from Peter Norton Computing (acquired by Symantec Corp). Both products work as advertised. We also know of Copy II/Mac and PC Tools/Macintosh from Central Point Software.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## MacDFT and IBM 4700 Connectivity

Revised: 9/30/90  
Security: Everyone

MacDFT and IBM 4700 Connectivity

=====

This article last reviewed: 10 September 1990

TOPIC -----

I have installed MacDFT with the Apple Coax/Twinax Card. I am interested in setting up a 4700 connection using MacDFT also. Tests have gone well, apart from some problems related to the keyboard. For instance, the string generated from a Clear in a 4700 configuration is different from the one generated from a 3278.

DISCUSSION -----

The 4700 series of Control Units are specialized controllers sold by IBM, typically to banks. This series includes the 4700, 4701, and 4702. The 8770 Control Unit is also a specialized controller sold by IBM to finance companies. These are specialized controllers, and there is no stated support for them with MacDFT.

One solution might be to set MacDFT up for CUT mode emulation. When MacDFT is in CUT mode, much of the terminal and communication processing is done by the controller. In this case, this may help eliminate or minimize any keyboard mapping discrepancies.

It is also possible there is an RPQ installed, which is a specialized remapping program. When using RPQ, you can usually go back to any "default" key by pressing "Alt" and the appropriate key. For example, to execute a Clear when using a RPQ, press Alt and Clear. With MacDFT, because the Alt key isn't mapped, you'll need to assign a key to the Alt-Clear sequence using the Keyboard mapping feature. This is documented in Chapter 5 of the "MacDFT User's Guide."

Other companies use a different strategy with RPQs. DCA sells different keyboard layouts for the Macintosh for some of the different RPQs commonly used.

If no RPQ is installed, you might be able to remap any errant keys using the keyboard mapping feature anyway.

## UNIX: Access to Macintosh File System

Revised: 9/4/92  
Security: Everyone

UNIX: Access to Macintosh File System

=====

Article Created: 30 September 1990  
Article Last Reviewed: 31 August 1992  
Article Last Updated : 31 August 1992

TOPIC -----

Do we have any documentation of what type of access is available in A/UX 2.0 to access the Macintosh side from UNIX applications? This would include writing programs or shell scripts that manipulate Macintosh programs or data in a Macintosh file system.

DISCUSSION -----

You can write hybrid applications that can access Macintosh volumes but retain a UNIX interface. To do this, you must use the calls provided in the Toolbox. These calls are documented in "Inside Macintosh" with the differences documented in the "A/UX Toolbox" manual.

Standard Macintosh applications can, of course, use both UNIX and Macintosh file systems simply by making the standard Macintosh File Manager calls. If these calls are used to access a UNIX file system, they are mapped internally to the appropriate UNIX routines instead, without the Macintosh application being aware of any differences.

On the other side, UNIX programs cannot see or use the Macintosh volumes. The "ls" binary is a perfect example of this. Because it was written using the standard UNIX libraries, it cannot access any Macintosh volumes. Because of this, shell scripts are also incapable of accessing Macintosh volumes. It is conceivable that you could write your own version of "ls" that uses the Toolbox but retains the same interface as the existing command. At that point, you could then use the command from within a shell script.

The A/UX Development Tools product is a full development package supporting this type of development.

## Macintosh: Input of CD Player Digital Data (11/94)

Revised: 11/21/94  
Security: Everyone

Macintosh: Input of CD Player Digital Data (11/94)

Article Created: 10 September 1990  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I have heard that there might be a hardware interface between an audio CD player's digital output and the Macintosh. Does such a thing exist?

DISCUSSION -----

DigiDesign offers Sound Designer, a digital signal processor that connects to the Sony-Phillips Digital Interface (the port on the back of many audio CD players).

The product does not provide any control for the CD player. It's purpose is to move digital information from a CD to a Macintosh hard disk. Once stored on the disk, the signal can be "played" or modified by programs like SoundEdit.

For more details, search the Technical Info library under "DigiDesign, Inc."

## LaserWriter IINTX: Setting the Mode Software Switch

Revised: 9/30/90  
Security: Everyone

LaserWriter IINTX: Setting the Mode Software Switch

=====

This article last reviewed: 10 September 1990

TOPIC -----

The new LaserWriter IINTX ROMs apparently allow software switching between the AppleTalk and RS-232 input modes. Has anyone written these files?

DISCUSSION -----

Yes, the new version of the "LaserWriter IINT/NTX Owner's Guide" details the commands necessary to switch modes. This manual is included with new LaserWriter IINTX models, and with all ROM upgrades. Appendix C of the manual, "Connecting to and Printing with an MS-DOS Computer," covers this and related issues in relative detail. We definitely recommend reading it, but below we have copied some of this section, which should be useful to you.

Although the section assumes use of a DOS computer, the PostScript code is the same for a Macintosh. Simply remove the DOS specific lines and download the file with the LaserWriter Font Utility.

-----

Selecting an operating mode

If you have a LaserWriter IINT:

\*\*\* Details on setting the LaserWriter IINT modes omitted \*\*\*

If you have a LaserWriter IINTX:

There are two ways to set the LaserWriter IINTX operating mode:

- You can use the DIP switches to set the mode.
- You can use software switching (sending a program to the printer) to set the mode. Software switching works only with LaserWriter IINTX printers that use

PostScript Rev 3.0 or later. Check your printer's startup page to see what Rev it uses.

If you plan to set the printer mode once or infrequently, use the DIP switches to set the mode. If you plan to change operating modes frequently, you should use software switching to set the mode. Both methods are described here.

#### Setting the Mode with DIP Switches

-----

You can set the LaserWriter IINTX to work in PostScript mode, to emulate a Diablo 630 printer, or to emulate a Hewlett-Packard LaserJet+ printer. Set the switches on the LaserWriter IINTX as follows.

#### PostScript Mode

-----

If you plan to use software that supports PostScript, switch 2 should be down, and switches 3 and 4 should both be up. Switch 1 can be up or down.

#### Diablo Emulation

-----

If you plan to use the Diablo emulator, switches 2 and 3 should be down and switch 4 should be up. Switch 1 can be up or down.

#### LaserJet+ Emulation

-----

If you plan to use the LaserJet+ emulator, switches 2, 3, and 4 should be down. Switch 1 can be up or down.

#### Setting the Mode with Software Switching

-----

Software switching can be used to set both the software mode used by the printer (PostScript or an emulator), and the hardware mode used by the printer (serial or AppleTalk).

To change the software mode using software switching, you send a program to the printer that changes a value called softwareiomode. To change the hardware mode using software switching, you send a program to the printer that changes a value called hardwareiomode.

The LaserWriter IINTX supports four values for softwareiomode:

- 0 (PostScript batch mode)
- 1 (PostScript interactive mode)
- 2 (Diablo 630 emulation)
- 5 (HP LaserJet+ emulation)

The LaserWriter IINTX supports two values for hardwareiomode:

- 0 (serial communication)
- 2 (the AppleTalk communication protocol)

To use software switching to select a hardware and software operating mode, type the following PostScript program at the DOS prompt and send the program to

the LaserWriter IINTX:

```
cd \  
copy con set.mod  
(Macintosh file begins here)  
serverdict begin 0 exitserver  
statusdict begin  
S setsoftwareiomode  
H sethardwareiomode  
(Macintosh file ends here)  
Control - Z
```

Instead of typing S in the line where it appears in the program, type the value for the software mode you want to set (0, 1, 2, or 5).

Instead of typing H in the line where it appears in the program, type the value for the hardware mode you want to set (0 or 2).

The program that changes your hardware and software modes is now saved in a file called SET.MOD. To send the program to the LaserWriter IINTX, type this line at the DOS prompt:

```
type SET.MOD > COM1
```

Substitute COM2 for COM1 in the line above if the LaserWriter II is connected to the COM2 port on your computer.

Typing the line given above and pressing return sets the software and hardware operating modes on the LaserWriter IINTX.

Switching from an Emulator to PostScript on the LaserWriter IINTX

-----  
There is a quick way to switch from either the Diablo 630 emulation or the LaserJet+ emulation and go into PostScript batch mode. Simply type into a file the command sequence Escape-Delete-Zero, followed by a Control-D, and print the file to the LaserWriter II. When you send this file, the LaserWriter II resets itself to PostScript batch mode.

## Sending SunView to MacX Server

Revised: 2/11/93  
Security: Everyone

Sending SunView to MacX Server

Article Created: 10 September 1990

### Article Change History

-----  
01/15/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I was trying to install MacX. Everything went fine until I tried to have my Sun computer send "SunView" to my MacX server. It didn't work. Instead of the client appearing on my screen, it showed the console screen. I tried the same thing with a VT100 terminal, and the same thing happened.

I know SunView is a "windowing" environment, but is it an X Window System? Isn't Sun's X Window System called OpenLook? Can SunView be a X client?

### DISCUSSION -----

SunView is Sun's older window system and is not an X client. Together, SunTools and SunView provide functionality similar to that provided by X Windows and X Windows-based applications -- that is, SunView provides a programming interface and basic windowing capabilities similar to X Windows. But this system is NOT X Windows, it is Sun's proprietary windowing environment, and is best thought of as a competitor to X Windows.

X is now the default window system shipping with new products (as of July 1990). Previously X was an unbundled product, available free from MIT or available from Sun for a media and documentation charge.

XNEWS is Sun's X server that interprets X protocol and PostScript (NeWS protocol). OpenLook is a functional specification for the "look and feel" of the user interface (by AT&T). X clients generally use X toolkits (like

XView, XT+, OLIT, and so on), but they could simply make Xlib calls.

Thus, SunView is not an X Window System nor an X client; you can't display it on MacX. If the Sun machine has the Xlib and applications, you should be able to start one using a command similar to:

```
/usr/bin/xcalc -display mac:0,0
```

where "mac" is the Macintosh node name defined in the host's file.

## VAX: Need to Use Non-PostScript Printer

Revised: 9/30/90  
Security: Everyone

VAX: Need to Use Non-PostScript Printer

=====

TOPIC -----

Is there software that lets the Macintosh print to a non-PostScript printer (for example, the LN03 or LA210 connected to a VAX via RS-232)?

DISCUSSION -----

We don't know of a product that lets you do this. For non-PostScript printers connected to a VAX via RS-232, you normally have to save the file as text only, and send this file to the VAX queue, using the device name of the printer captured by that queue.

If you have DECnet support on the Macintosh, you can use the DECnet COPY command to copy the file to the VAX, using the VAX node name and printer device name as the destination (for example, ENGVAX::LPA0:, where "ENGVA" is the DECnet node name of the VAX, and "LPA0:" is the printer name).

If you don't have DECnet on the Macintosh, you have to transfer the file to the VAX first, using a terminal emulation program and XModem or Kermit, and use a VAX/VMS DCL command to print the file.

## A/UX 3.0 and X Installation Problems

Revised: 2/11/93  
Security: Everyone

A/UX 3.0 and X Installation Problems

=====

Article Created: 10 September 1990

### Article Change History

-----

01/15/93 - REVIEWED  
    • For technical accuracy.  
01/15/93 - REVISED  
    • Updated article to A/UX 3.0.

### TOPIC -----

Due to the size of the A/UX partitions, I decided to load X Window System in a separate partition. Modifying the path parameter in .profile and .login should provide the proper support for this location. It didn't work. It continued looking in the /usr/xxx/X11 directories versus /App/usr/xxx/X11 as was stated in the .profile command. What other supporting files need to be modified for this redirection? We accomplished the task via the link command "ln -s /xxx/xxx /xxx".

### DISCUSSION -----

The files X, X11, and X11R3 in the /usr/bin/X11 directory contain references to the /usr/bin/X11 and /usr/lib/X11 directories. There are several ways to get around this. You could add the environment variables \$X11BINDIR and \$X11LIBDIR to your .login or .profile files, setting them to the location of the new X lib and bin directories. If you are using the Bourne shell you would then export them, or if you're using the csh you would create them as environment variables (that is, with setenv(1)). You could also just link the new directories to the old locations, making symbolic links between the old and the new. Or you could modify the /usr/bin/X11/[X X11 X11R3] scripts to reflect the new directory locations. Any of these procedures should solve your problem.

## AppleTalk Routers that Support TCP/IP

Revised: 9/30/90  
Security: Everyone

AppleTalk Routers that Support TCP/IP

=====

This article last reviewed: 10 September 1990

TOPIC -----

I want to install twenty Macintosh IIx systems on an Ethernet. I don't want to connect my Macintosh IIx directly to the Ethernet backbone. Now, I am looking for a router that can route Ethernet to Ethernet. Apple's Internet Router is no solution because I need TCP/IP routing.

Do you know of a TCP/IP and AppleTalk router (hardware or software) that can route between two Ethernets, not only LocalTalk to EtherTalk.

DISCUSSION -----

There are a couple of alternatives. The NRC (Network Resources) router is a TCP/IP and AppleTalk combined router that runs on a Macintosh II class system. They also offer hardware based stand-alone routers that perform the same function. Cisco Systems and ACC (Advanced Computer Communications) both offer Ethernet-to-Ethernet routers that support both AppleTalk and TCP/IP.

## Parallel AppleTalk Internet Routers

Revised: 9/30/90  
Security: Everyone

Parallel AppleTalk Internet Routers

=====

This article last reviewed: 10 September 1990

TOPIC -----

What route does an AppleTalk message take if you have two AppleTalk Internet Routers connected in parallel? For example, if you have an EtherTalk backbone with two AppleTalk Internet Routers to a LocalTalk-based network, how and what decides which route the message takes?

DISCUSSION -----

LocalTalk nodes use the router contained in the A-ROUTER variable. This variable is updated every time the node sees an RTMP packet. The source network number and node number of the RTMP packet are copied into the A-ROUTER variable. Sometimes, the packet travels to the EtherTalk backbone via the first router, and sometimes it travels to the EtherTalk backbone by the second router.

The best routing algorithm is implemented in EtherTalk 2.0, TokenTalk 2.0, and AppleTalk Phase 2 for A/UX and MS-DOS. It can, theoretically, be added to LocalTalk nodes at a later date.

In the past, a non-router node has not kept much information on how to get to other networks. A node kept track only of the address of one router on its local network, assuming that the router would know how to reach the rest of the Internet. Whenever the node had a packet to send to a different network, the node sent the packet to the one router it knew about.

Generally, this algorithm didn't cause any problems. However, in very large, bridged Ethernets or Token Rings, it can be inefficient, because the one router that a node knows about can be quite far away and not the best router to use.

With AppleTalk Phase 2, nodes can optionally keep information on how best to get to other networks. When a node that uses the best-routing algorithm gets a packet from another network, it looks at the address of the last router that

forwarded the packet. This is the router it uses to get to that distant network in the future.

## AppleTalk for VMS: Router Problems

Revised: 9/30/90  
Security: Everyone

AppleTalk for VMS: Router Problems

=====

This article last reviewed: 10 September 1990

TOPIC -----

I am having a problem with AppleTalk for VMS when connecting Macintoshes to other computer systems. If I use Liaison as a gateway between LocalTalk and Ethernet, I don't get any response from the AlisaTalk software on the VAX. I said that the RTMP table is not correct, so there is no connection between the networks. If I remove Liaison from the Macintosh and connect it directly to the Ethernet, there is no problem. I do not believe this is a problem with Liaison, because I have the same problem with Shiva FastPath.

Is this a known problem? Can you explain?

DISCUSSION -----

There are two possible areas that might be causing the problems you are seeing.

The first has to do with AppleTalk Phase 2 versus AppleTalk Phase 1. It is possible that you have installed the Phase 2 version of AppleTalk for VMS without realizing it, and you are trying to use Phase 1 routers, like Liaison. There are two ways you can test this:

- 1) Open the ATKBRIDGE.LOG file on the VAX and check the version of AppleTalk for VMS that is being run. If it says you are running version 2.1, you are running the Phase 2 version of ATK/VMS.
- 2) On the machine you are running Liaison, run the Internet Router instead. If you run the Internet Router without the Phase 2 Upgrade Utility installed, and you can see the services, you are running AppleTalk Phase 2 on the VAX. If you cannot see the services, and then you install the Upgrade Utility along with Phase 1 EtherTalk on the router and you can see the services, you are running Phase 1. We also know that it is something about the other routers causing the problems.

The other area you should investigate if it is not a Phase 1 versus Phase 2 issue is network numbers. AppleTalk for VMS is a router. In the default configuration, it has specifications for two networks, the Ethernet the VAX is connected to and the virtual network running inside the VAX. When you add the other router to the network, you have to ensure:

- 1) AppleTalk for VMS and the new router have the same network number specified for the Ethernet.
- 2) The virtual network has a unique network number specified for it.
- 3) Any other networks connected to the new router have unique network numbers as well.

Each router has a different method for specifying network numbers. For AppleTalk for VMS, this information is maintained in the PORTDESC.TXT file in the AppleTalk directory.

## A/UX 2.0: IBM ftp Problem (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX 2.0: IBM "ftp" Problem (8/94)

=====

Article Created: 10 September 1990  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

I am having problems with A/UX 2.0 and "ftp". When I do this:

Account Read

I get the message message:

230 Working directory is RVFC60 191 (read only)  
Segmentation fault (core dump)

The network components are A/UX on an Ethernet connected to an IBM 8232 gateway through a Cisco Systems router to an IBM 3090 running IBM TCP/IP. The IBM operating system being used is VM/XA CMS. The CMS volume referenced in the error message has a proper READ password and is accessible using the same technique from a Sun Workstation.

The process worked once, but I'm not sure why. It has failed consistently ever since. Can you explain?

DISCUSSION -----

We have duplicated the problem you describe, and it will be submitted as a bug report to A/UX Engineering. One workaround is to enter the "account" command by itself and then input the account information when "ftp" prompts you for it. This seems to prevent the core dump and lets "ftp" function normally. This problem is resolved in A/UX 3.0.

## A/UX 2.0: Various Issues

Revised: 11/9/92  
Security: Everyone

A/UX 2.0: Various Issues

=====

Article Created: 10 September 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Can you help me with these A/UX 2.0 questions and problems?

1) "adb" does not seem to work. Therefore, I cannot debug my program. We have ordered MacsBug.

2) When using "sfgetfile" and "sfputfile," why is my home directory in "/"? It creates bad pathnames when I try to get something from

/usr/mgb/images/image1

The path I get from "sfgetfile" is

/mgb/images/image1

3) When I log in to A/UX after it says that it is starting "session for mgb", it clears the screen. Is this correct?

4) If I am "mgb" and I do a "df" disk free command, I get different values from when I am the "root". Try these next lines:

```
% df
xxx xxx xxx xxx
% su
# df
YYY YYY YYY YYY #
```

where x and y are different by about 10000 blocks.

DISCUSSION -----

- 1) Use MacsBug version 6.2 or later. See APDA for a copy.
- 2) The reason for this behavior is that under A/UX you have a virtual root that is accessible by all users (one at a time). A/UX 2.0 puts your personal user directory onto the desktop so that you see it when you log in. To do this, the Finder has "to play some games" with the UNIX file system to make this seem like what the Finder expects. Folders on the desktop are at the root level under the Macintosh OS, so we had to try to emulate that behavior under A/UX. This is why your path to your home directory appears as "/". It may be more proper from a UNIX standpoint to map the directory to its real location, but if you need that functionality use "open" or "fopen" instead of "sfgetfile".
- 3) No, that's not the correct behavior. Check the contents of your .login file.
- 4) A/UX now uses the Berkeley file system. As "root" you have no limitations on its use, as a normal user, there is a 10% overhead attached to each partition that is not available to a normal user. This prevents unnecessary disk thrashing if the partitions become full.

## A/UX: NFS Auto-Mount and other Support Issues (9/94)

Revised: 9/1/94  
Security: Everyone

A/UX: NFS Auto-Mount and other Support Issues (9/94)

=====

Article Created: 10 September 1990  
Article Reviewed/Updated: 1 September 1994

TOPIC -----

- 1) What are secured RPCs, and does Apple support this in A/UX?
- 2) Does A/UX 3.0 have the NFS auto-mount feature? Also, what is auto-mount?
- 3) Does Apple support TCP/IP over Token Ring with A/UX?

DISCUSSION -----

- 1) Secure RPC is an additional authentication flavor for ONC RPC that uses a public-key system to ensure that nobody is passing forged credentials over the wire.

The RPC protocol allows arbitrary authentication "flavors". Normally, the flavor "NULL" is used, or "UNIX", which carries around a UID and GID list, must be used from a reserved port to be trusted. The idea was that secure RPC would use DES encryption, based on keys obtained through a public-key distribution scheme.

Unfortunately, I don't know anyone who has successfully set up secure RPC (the primary application is, of course, secure NFS). There are also some ad-hoc changes done by Athena to use Kerberos authentication to NFS.

It differs from non-secure RPC in that it uses a different authentication flavor. ONC RPC supports multiple flavors of credentials:

AUTH\_NONE - No credentials; the server has no idea who the user was who made the request, so there better not be any risks of an unauthorized user making the request.

AUTH\_UNIX - UNIX user ID, group ID, and group list passed over the wire; if you work hard enough, and it's not *that* difficult, you can send somebody else's user ID over the wire--NFS servers often map user ID 0 to the user ID for "nobody", and may do other mappings, but few other servers do that kind of mapping.

AUTH\_DES - "network name" passed over the wire, which is converted to the appropriate native machine credentials (for UNIX, a user ID, group ID, and group set) on the server. The credentials are encrypted using a public-key system, which makes it more difficult to forge credentials, but, allegedly, the public-key cryptosystem in question *is* breakable if you burn enough cycles.

"Secure RPC" in SunOS/ONC terms is RPC using AUTH\_DES authentication.

Other flavors of authentication can be added by developers.

There is a very good writeup on Secure RPC in the "Security Features Guide" (part number: 800-1735-10), May 1988 for SunOS 4.0.x, section 6.3 "RPC Authentication." This information was moved to "Network and Communications Administration" (part number 800-3805-10), March 1990 in the SunOS 4.1 DocBox set, section 14.9 "RPC Authentication".

- 2) The auto-mount feature of NFS provides a mechanism to mount automatically NFS exported filesystems on the fly. This allows dynamic mounting of NFS partitions without having to explicitly mount the partitions from within the "/etc/fstab" file or by using the mount(1) command.

A/UX 2.0 does NOT have the NFS automount feature. However, A/UX 3.0 DOES have this feature.

- 3) There are no plans to support Token Ring under A/UX. Therefore, there are no plans to support TCP/IP running over Token Ring.

## Zone Problems Caused by Old Phase 1 Routers

Revised: 9/30/90  
Security: Everyone

Zone Problems Caused by Old Phase 1 Routers

=====

This article last reviewed: 10 September 1990

TOPIC -----

I have a Phase 1 network with FastPaths bridging between LocalTalk and Ethernet. It has a problem seeing a defined as 0, which is causing some network problems. What is the cause of this?

DISCUSSION -----

The problem you're seeing is caused by older Phase 1 routers that are seeing the new-style, Phase 2 non-extended RTMP packets. New-style, non-extended RTMP packets have a special tuple as the first tuple in the set. This tuple contains 2 bytes of 0 and 1 byte used for an RTMP version number (0x82,131 decimal).

Older Phase 1 routers do not understand that this tuple is not a valid network tuple and, instead, interprets it as a distant network. This is usually reported as network 0, 131 hops away. This should not cause any significant problems for your network, but you should try to get all of your routers updated to the most recent releases available from the different vendors.

## System 6.0.x, 7.x: How They Handle 4MB SIMMs (9/95)

Revised: 9/19/95  
Security: Everyone

System 6.0.x, 7.x: How They Handle 4MB SIMMs (9/95)

Article Created: 10 September 1990  
Article Reviewed/Updated: 19 September 1995

TOPIC -----

If a SIMM bank is filled with 4MB modules (giving 16MB), will 8MB be used by System Software 6.0.x, or will the system not know what to do with these SIMMs? We are concerned that these SIMMs will bomb the system.

DISCUSSION -----

System software 6.0.x is a 24-bit operating system. When a Macintosh system is running system software 6.0.x, the Macintosh is in 24-bit mode. In 24-bit mode, the Macintosh II family of computers has the address space starting at \$00 0000 through \$7F FFFF (8MB) reserved for system RAM. The SIMM sockets use the entire system RAM address range of \$00 0000 through \$7F FFFF, which equals 8MB of RAM.

As you can see from this, with 24-bit addressing, installing four 4MB SIMMs would give you 8MB of usable RAM. The memory configuration under "About This Macintosh..." (About the Finder with System 6) will report 16MB installed, but 8MB is usable with the remainder being assigned to the system software. The extra memory assigned to the system software is unusable. In the case of the Macintosh LC, 2MB RAM is on the logic board. If you install two 4MB SIMMs, the Finder will report that 10MB of RAM installed. 8MB of RAM is usable.

With System 7, you have the option of turning on 32-bit addressing in 32-bit clean ROM computers, with the exception of the AV and Power Macintosh models which operate in 32-Bit mode at all times. (MODE32 installed on computers running System 7 versions prior to 7.1 or the 32-Bit System Enabler installed on computers running 7.1 will enable 32-bit operation). This allows addressing above 8MB in those computers that physically support more than 8MB of RAM.

A/UX is also a 32-bit operating system that can address above 8 megabytes of RAM. A/UX supports up to 256MB of physical RAM.

In 32-bit mode, the Macintosh II family of computers (which includes the

Macintosh SE/30) has the address space starting at \$0000 0000 through \$3FFF FFFF (1 gigabyte) reserved for system RAM. NuBus RAM cards may use address \$0000 0000 through \$3FFF FFFF to add system RAM. The SIMM sockets use address \$0000 0000 through \$07FF FFFF, which equals 128MB of RAM.

Here's a list of the current Macintosh systems and the maximum physical memory that the SIMM sockets support:

Begin\_Table

| Macintosh System | Maximum Physical<br>RAM |
|------------------|-------------------------|
|------------------|-------------------------|

-----

Non 32-Bit clean systems

|                              |           |

End\_Table

# Requires the 32-Bit System Enabler with System 7.1 or MODE32 with versions of System 7 earlier than 7.1.

## Requires the 32-Bit System Enabler with System 7.1 or MODE32 with versions of System 7 earlier than 7.1, as well as the FDHD upgrade kit and PMMU (The FDHD upgrade has been discontinued).

+ These models are designed to handle 16 megabyte SIMMs but only 4 megabyte SIMMs are officially supported by Apple at this time.

\* There are two different reasons that the Macintosh II and the Macintosh IIX can't support the higher density SIMMs. First, the Macintosh II ROM startup code doesn't know about 4MB SIMMs and won't start up.

Second, the Macintosh IIX ROM does know about 4MB SIMMs, but standard 4MB SIMMs won't work on the Macintosh IIX. This is because JEDEC, the committee overseeing the standardization of new solid-state devices, added an additional built-in test mode to high-density DRAMs. The test mode is invoked by a sequence of electrical signals which was ignored by earlier-generation DRAM. This specification for 4MB SIMMs was changed after the Macintosh IIX was developed. At the time the Macintosh IIX

was developed, in theory, 4MB SIMMs should have worked. It wasn't known at the time that the specification would be changed. The result is that the current standard 4MB SIMMs don't work on the Macintosh IIX.

There are special 4 Megabyte SIMMs available that have a PAL chip which will allow their use in the Macintosh II and IIX. You'll need to contact the SIMM vendor or manufacturer to see if they have these special SIMMs available.

This subject is described in detail in Tech Note #176. Refer to the Developer Tech Answers Library in the Developer Support folder for further information on this Tech Note.

Article Change History:

19 Sep 1995 - Revised to show discontinued upgrade.

18 Aug 1994 - Revised to include Macintosh 630 family and Duo 280c.

15 Mar 1994 - Revised to include recent Macintosh and Performa models, corrected formatting.

## Macintosh: How System Heap Size Is Allocated (11/94)

Revised: 11/28/94  
Security: Everyone

Macintosh: How System Heap Size Is Allocated (11/94)

=====

Article Created: 10 September 1990  
Article Reviewed/Updated: 28 November 1994

TOPIC -----

- 1) Where is the heap size stored on a volume?
- 2) If I adjust a heap size on a volume and copy that System Folder to another empty drive, will the boot blocks be set to the new modified size?

DISCUSSION -----

The default heap size is stored in the boot blocks of a startup volume. For System Software 6.0.4 and System Software 6.0.5, the default size 128K.

Note: When the System Software 6.0.5 System Tools disk is booted on a Macintosh SE with 1MB RAM, the System heap takes up 188K of RAM. The default System heap size is used as a guideline; the heap size is increased, if necessary.

The boot blocks, including the default heap size, are taken from the source disk, unless that disk does not have a valid copy of the boot blocks or if it is a file server. In these cases, the boot blocks are taken from the "boot" resource in the System file being copied.

A/UX 2.0: CD-ROM in A/UX File System Format

=====

Article Created: 30 September 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Is anyone doing CD-ROMs with an A/UX file system rather than hfs? I am setting up an A/UX anonymous ftp server for a university that would like to have CD-ROMs connected for public access.

### DISCUSSION -----

Yes, it is possible to have a CD-ROM in A/UX file system format mounted under A/UX and accessed by local or remote users. The distributed A/UX CD-ROM is an example of this.

MacroMind Director 2.0 Bug: Conflict with On Location

=====

This article last reviewed: 11 September 1990

TOPIC -----

Is there anything about peculiar about the ON Location update (special edition of Desktop Focus)?

DISCUSSION -----

No, there is nothing peculiar about On Location. Rather, the problem was with MacroMind Director release 2.0. Disabling the ON Location INIT was the temporary workaround. The solution is to get release 2.0.1 of MacroMind Director. It fixes the bug.

## AppleShare PC: 3.5-Inch and 5.25-Inch Install Disks

Revised: 9/30/90  
Security: Everyone

AppleShare PC: 3.5-Inch and 5.25-Inch Install Disks

=====  
This article last reviewed: 16 November 1989

TOPIC -----

My office does not have a dual 5.25-inch drive PC. This makes it cumbersome to copy AFE the files, because when I find that they are the wrong ones, and have to go back to AFE. What files does install.exe look for when doing the four different installs (printing, printing, file access, and so on)?

DISCUSSION -----

AppleShare PC 2.0 shipped with both a 3.5-inch 720K install disk, and a set of 5.25-inch 360K install disks. The files contained on the 5.25-inch disks are no different than those on the 3.5-inch disk; they're just divided across two disks. However, as you have found, the distribution of the files is important.

Until you get the new version, you can make a functional set by creating two disks with the file distribution listed below. After you copy all the files, Disk #1 will have approximately 4K available, and disk #2 will have approximately 33K available. Neither has enough space for MS-DOS system files.

Workstation Disk #1

## HyperCard 2.0: New Product Features (2 of 2)

Revised: 9/30/90  
Security: Everyone

HyperCard 2.0: New Product Features (2 of 2)

=====

This article last reviewed: 30 August 1990

### HyperTalk Enhancements

-----

- The Script Editor supports numerous of new features:
  - Modeless windows (several open at same time)
  - Search and Replace
  - Commenting and uncommenting selected lines
  - Undo for cut, copy, paste, clear, and typing operations
  - Horizontal scrolling (for 2-page display)
  - Triple-clicking to select a line
  - Allows setting of debugging checkpoints
- The HyperTalk Compiler replaces the HyperTalk interpreter used in earlier versions. As a result, HyperTalk scripts run faster in HyperCard 2.0 (as much as three times faster). Handlers are compiled automatically on the first execution of the handler and the compiled code is cached in RAM to be available for subsequent calls to that handler. The compiled handler remains in memory until that memory is needed for other handlers. When HyperCard 2.0 quits, the compiled HyperTalk code is flushed from memory, so only the HyperTalk source code is saved to disk.
- The HyperTalk Debugger engages when a execution encounters checkpoint. These checkpoints are inserted in the source code using the script editor. You can also enter the debugger by pressing Command-Option-Period.
- Background Processing: With HyperCard 2.0, you can switch to another application under MultiFinder while a script is running, and the script will continue to execute while HyperCard 2.0 is in the background. Other functions, like sorting and compacting also work while HyperCard 2.0 is in the background. HyperCard 2.0 yields to MultiFinder at the following times:
  - At the completion of a HyperTalk line.
  - When the busy cursor rotates (sorting, compacting, and printing)

- During the execution of the Show Cards and Wait commands

HyperCard 2.0 notifies the user whenever user intervention is required.

- **XCMD Enhancements:** The XCMD interface in HyperCard 2.0 is an extension of the XCMD interface originally implemented in HyperCard. HyperCard 2.0 provides the means for XCMDs to create and manage their own windows and menus and to call the sound manager directly. HyperCard 2.0 uses this XCMD window interface to implement the Script Editor and Debugger.
- **Color Windows:** While the card window does not support color, an XCMD can own a color window that supports bit depths of up to 24-bits. This lets the stack creator display a color picture while inside of HyperCard.
- **Sound Control:** Now, XCMDs can call the sound manager directly for increased control over sound from an XCMD.

#### Miscellaneous. Enhancements

- **Custom Menus:** The entire menu bar and its contents can be controlled by a HyperTalk script. This lets stack creators add, modify, or remove any menu items. As a result, you can make stacks that look like stand-alone applications, without having to resort to XCMDs.
- **Palettes:** HyperCard 2.0 has a feature which lets users create palettes, similar-to the Tools palette and the Patterns palette. To create these palettes, you must create a PICT resource that defines the visual part of the palette. This can be created in many of the popular paint programs and can be in color. You must also create a PLTE resource to define the rectangles for the buttons in the palette and the HyperTalk scripts that are executed when each is pressed. Creating a palette does not require coding in languages like Pascal, C or Assembly.
- **Icon Editor:** HyperCard 2.0 has a built-in icon editor, so that you can create or modify icons without the use of utilities such as ResEdit.

The editor displays a "fat-bits" representation of the icon, in which you can click within the image to toggle bits on or off. There are also several menu commands that further help you edit icons. They include the commands Flip Horizontal, Flip Vertical, Frame, Gray, Invert, Mirror Horizontal, Mirror Vertical, Rotate 90 degrees, Shadow, and Pickup.

- **Marked Cards:** Now, each card has a Mark property that lets a user or HyperTalk handler flag a card for some reason. Usually, this feature is used by a HyperTalk script during a search for cards that contain information that matches a certain criteria. Each card that contains that information is then marked. Once the appropriate cards have been marked, they can be processed as needed.

This feature is used with the HyperCard 2.0's report-printing capabilities to select which cards will be included within a report. For example, in a quiz

the developer could mark the cards the student got wrong and print those cards out for later review.

- Visual Effects: In the past, visual effects have only worked on monitors set to 1 bit per pixel. HyperCard 2.0 supports visual effects on monitors set up to 8 bits per pixel. There are two new visual effects--Stretch and Shrink.,

To help make it easier for stack developers to use visual effects, HyperCard 2.0 has a visual effects selection dialog for buttons. This dialog is illustrated below.

- Dynamic Dialog Sizing: Most of the HyperCard 2.0 dialogs, including the Ask and Answer dialogs, can now hold more text and size themselves to fit the amount of text. The previous limit was one line of text. This limit has been raised to approximately 240 characters, and as many lines that can be displayed on a classic, nine-inch Macintosh screen. For example, if a stack pathname is too long to fit on a single line, the Stack Info dialog will resize itself to fit up to five lines to accommodate the pathname.
- Painting Enhancements: New special effects have been added to HyperCard 2.0's Options menu. These effects work on graphical selections chosen with HyperCard 2.0's paint Selection tool. The four new effects are:
  - Rotate to provides free rotation of graphics about the center of the selection.
  - Slant to stretch the selection into the shape of a parallelogram, making the image appear slanted.
  - Distort to let you stretch a corner of the selection arbitrarily in two directions
  - Perspective to stretch the selection into the shape of a parallelogram or trapezoid, making the image appear to have perspective depth.
- Stack Security: When protecting stacks, HyperCard 2.0 has the two new possibilities of Can't Peek and Can't Abort. Can't Peek lets stack developers protect confidential script source code from users. Can't Abort prevents users from pressing Command-Period to stop execution of a HyperTalk handler. When this protection is set, execution of handlers cannot be prematurely halted by the user.

Note: Both of these features should be used with care. In most cases, it is advisable to lock only copies of the stack, and not the original stack.

GARFIELD 2 and MDEF Virus: Definition

=====

This article last reviewed: 28 September 1990

The GARFIELD 2 virus, also known as MDEF, was discovered 13 August 1990. It is a variation of the GARFIELD virus that originated at Cornell University. It rennumbers the system menu definitions of System files, resulting in odd menu behavior, no menu pop-down, odd system behavior, and odd application behavior.

To add a new virus definition to SAM 2.0, enter the following information:

Virus Name: GARFIELD

Resource Type: MDEF

Resource ID: 0

Resource size: ANY

Search String: A9A92F0CA9AA2F0CA9B0

String Offset: ANY

## NEC DM-3000P Monitor: Connecting to a Macintosh

Revised: 9/30/90  
Security: Everyone

NEC DM-3000P Monitor: Connecting to a Macintosh

=====

This article last reviewed: 28 September 1990

TOPIC -----

What are the specifications for the cable to connect a Macintosh to an NEC IPS-100 Monitor?

DISCUSSION -----

According to NEC technical support, the most efficient way to connect the Macintosh (with the older Apple 8-bit video card) is to use a cable from Inline, Inc. (part number is IN9021). This connects the 15-pin connector on the older Apple 8-bit video card to the 34-pin connector on the DM-3000P.

At this writing, NEC had not tested this cable with the newer Apple video cards, but it may work unless there is a problem with the configuration of the sense pin connections on the new cards. The sense pins are used to let the new video cards know what mode to use.

Inline checked the configuration information and said that there is no need for the NEC IPS-100 Computer Interface when connecting the DM-3000P to the Macintosh. Their IN9021 cable, which is 15-pin-to-34-pin, is all that is needed to connect the two.

For further information on Inline, search the Tech Info Library using "Inline, Inc."

TOPIC -----

Can I connect to the UPI wire service from a Macintosh?

DISCUSSION -----

According to UPI (United Press International), all you need is a:

- Modem
- Communications program
- Subscription to the UPI service

News services like UPI are aimed at media clients: newspapers, magazines, radio, and television. Direct connections to these services are more expensive than the average individual can afford. For those interested in news services, an alternative is to use commercial network services like CompuServe or GEnie. These are far less expensive, but contain a wide range of information.

Macintosh 12" RGB Display: Software Compatibility

=====

This article last reviewed: 15 October 1990

Several applications do not recognize the Apple Macintosh 12" RGB Display as being 512 x 384 pixels instead of 640 x 480. This leads to windows that are partially off the screen. ColorStudio 1.0 and PixelPaint 2.0 are two applications with this problem. In some cases, the windows can be resized -- but in others, there is no way to work with the application and restarting the system is the only way out.

Macintosh IIsi: Application Software Compatibility

=====

Article Created: 15 October 1990  
Article Last Reviewed: 15 July 1992  
Article Last Updated:

TOPIC -----

This article summarizes the software compatibility issues at the introduction of the Macintosh IIsi.

DISCUSSION -----

The Macintosh IIsi Was Widely Seeded

-----

In the United States alone, over 300 developers received Macintosh IIsi seed units. Many other developers received full documentation, and were able to test their products at Apple. This was the most extensive seeding and testing of a new computer in recent history.

Of the applications on which Apple had compatibility information, 97% either worked with the Macintosh IIsi, or were in the process of being revised. The other 3% were discontinued products.

Compatibility Issues

-----

FPU: Apple identified about twenty application programs that required an FPU (and did not have an alternate non-FPU version). Many of the color paint programs that fell in this category were revised to work on all Macintosh models. However, most CAD/CAM programs and other high-end graphics/math programs still require an FPU. We will identify these applications on all compatibility lists.

Microsoft Excel: Version 2.2a or higher is recommended for all Macintosh IIsi and Macintosh LC configurations. Microsoft offers a free upgrade from 2.2 to 2.2a.

Monitor size: Several programs did not work properly on the Apple Macintosh 12-inch RGB Display, because they assumed a minimum 640-pixel by 480-pixel size. These programs were in the process of being revised.

Macintosh SE/30 cards: Some Macintosh SE/30 cards did not work with the Macintosh IIsi, due to incorrect timing and physical dimensions. All cards that followed the guidelines in Apple's "Cards and Drivers" manual work correctly.

NuBus power requirements: Some NuBus cards exceeded the 15W power maximum specification. These cards were primarily the high-end graphics and video cards. We asked developers of these cards to include, in their manuals, references to power if they exceeded the maximum specification. We also included a caution in the Macintosh IIsi manual.

Sound: The new sound input software made it necessary for some developers to update their software. Latest versions should work with the new Macintosh models.

AppleTalk: An AppleTalk problem in System 6.0.6 was fixed in System 6.0.7, which shipped with all Macintosh IIsi and Macintosh LC systems sold in the United states.

Macintosh IIsi: Compatibility With Selected Software 1/93

Article Created: 15 October 1990  
Article Reviewed/Updated: 27 July 1993

Apple recommends that customers use the latest versions of Macintosh software that are compatible with their Macintosh hardware. Apple compiled the following list from information received from many software developers. These developers have recommended certain versions of their software for use with the Macintosh IIsi computer.

This is not a comprehensive list of programs, or versions of programs, that are compatible with the Macintosh IIsi. Please contact your dealer or the software developer if you have any questions. They can help you identify the newest version of a particular program and tell you how to upgrade if necessary.

| Developer             | Program/Version               | Telephone           |

## Macintosh IIsi: Expansion Card Compatibility

Revised: 7/16/92  
Security: Everyone

Macintosh IIsi: Expansion Card Compatibility

=====

Article Created: 15 October 1990  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 15 July 1992

TOPIC -----

This article describes some of the compatibility issues between the Macintosh IIsi and NuBus and 030 direct cards. To determine if a given card has any of the following problems with the IIsi, the manufacturer of the card should be contacted.

DISCUSSION -----

### CARD POWER REQUIREMENTS

Some NuBus cards exceed the 15-watt limit for NuBus cards. In the case of Macintosh II models with multiple NuBus slots, an empty NuBus slot usually provides some margin. Because the Macintosh IIsi is a one-slot system, that margin does not exist. As a result, it is more critical that the 15-watt power requirement for NuBus cards be maintained in the Macintosh IIsi.

For example, the Apple Macintosh Display Card 8•24 GC takes slightly more power, due to the processor and on-board memory, than the NuBus power specification of 15 watts. However, after the completion of initial tests, Apple is able to recommend using the card with the Macintosh IIsi in normal operating environments. Apple is continuing testing for elevated temperature environments. We will publish results of these tests as they become available. Until then, we do not recommend the combination of Macintosh IIsi and Macintosh Display Card 8•24 GC in environments where the temperature is expected to regularly exceed 32 C or 90 F.

For more information on Macintosh Display Card 8•24 GC, search under "Macintosh IIsi" and "Display Card 8•24 GC".

With regard to third-party cards, we have found the vast majority to be completely compatible and to work reliably with the Macintosh IIsi. In those few instances where the power specification exceeds the NuBus specification, or if you have any questions or concerns about a specific product, contact the vendor. In Apple's case, we can now recommend all of our displays cards across the line of NuBus-capable Macintoshes.

#### CARD SIZE

NuBus and 030 Direct cards that deviate from the size specifications of each type of card may experience fit problems. Also, NuBus cards that are a two-card set, such as a video card and an accelerator, will not work in the Macintosh IIsi.

#### CLOCK SIGNAL

Macintosh SE/30 cards that depend on the 16-MHz clock speed of the Macintosh SE/30 do not work with the Macintosh IIsi because the clock speed of the Macintosh IIsi is 20 MHz.

Macintosh IIsi: Specifications (Discontinued 3/93)

Article Created: 12 November 1990  
Article Reviewed/Updated: 13 September 1994

TOPIC -----

This article provides specifications for the Macintosh IIsi.

DISCUSSION -----

### MICROPROCESSOR

- MC68030, 32-bit architecture, 20 MHz clock frequency, built-in memory management unit (MMU)

### CO-PROCESSOR

- Optional MC68882 Floating-Point Unit (FPU), 20 MHz clock frequency through the installation of a IIsi NuBus adaptor card

### MEMORY

- 1MB RAM on logic board and four memory expansion slots. Expandable to 17MB of RAM by installing 4MB SIMMs in the empty slots. The Macintosh IIsi requires RAM that is 100ns or faster. The RAM that Apple installs in Macintosh IIsi systems is 80ns.
- 512K ROM, with ROM SIMM for future upgrades
- 256 bytes of parameter memory

### DISK DRIVES

- SuperDrive 1.4MB high-density floppy disk drive
- Optional external 1.4MB or 800K disk drive
- Internal Apple SCSI hard disk drive (1/3 height @ 40 or 80 MB)
- Optional external SCSI hard disk drives (up to 6)

### SOUND

- Custom sound chip, including stereo output capability
- Monaural sound input

### INTERFACES

- One ADB port supports keyboard, mouse, and other daisy-chained devices via its synchronous serial bus.
- Video port supports various RGB and monochrome displays.
- Internal expansion slot accommodates either a NuBus or 030 Direct expansion card connected to the appropriate adaptor. Power budget: maximum 15 watts.
- Two RS-232 / RS-422 serial ports, 230.4 Kbits/second maximum.

#### AC INPUT REQUIREMENT

- Line voltage: 00-240 volts AC, automatically configured
- Line power: 67 watts maximum, not including monitor power
- Line current: 1.43-0.56 amps (determined by input voltage)
- Frequency: 50-60 Hz single phase

#### AC AUXILIARY OUTPUT

- Output receptacle voltage: 100-240 volts AC (determined by input voltage)
- Output receptacle power: 300 VA maximum
- Output receptacle current: 3 amp maximum steady-state

#### SYSTEM POWER

47 watts maximum {60 watts peak during hard drive spin-up (15 sec)}  
+ 5 volt 6.8 amps  
+12 volt 0.8 amps {1.9 amps during hard drive spin-up (15 sec)}  
-12 volt 0.3 amps

#### CLOCK/CALENDAR

- CMOS custom chip with long-life lithium battery

#### SIZE AND WEIGHT

- Main Unit
  - Width 12.4 inches (31 cm)
  - Height 4 inches (10 cm)
  - Depth 14.9 inches (37.2 cm)
  - Weight 10 lb. (4.5 kg)
- Mouse
  - Height 1.1 inches (2.8 cm)
  - Width 2.1 inches (5.3 cm)
  - Depth 3.8 inches (9.7 cm)
  - Weight 6 oz. (.17 kg)

#### ENVIRONMENT

- Operating temperature: 10 to 40 degrees Celsius  
50 to 104 degrees Fahrenheit
- Storage temperature: -40 to 47 degrees Celsius  
-40 to 116.6 degrees Fahrenheit
- Relative humidity: 5% to 95% (noncondensing)
- Altitude: 0 to 3048 m (0 to 10,000 ft.)

09/07/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Can SunView applications run under A/UX?

### DISCUSSION -----

SunView is a proprietary windowing system, specific to Sun's operating system. Without a way for a A/UX system to emulate a Sun, SunView applications cannot run under A/UX.

## Macintosh 12-inch RGB Display

Revised: 10/23/90  
Security: Everyone

Macintosh 12-inch RGB Display

=====

This article last reviewed: 16 October 1990

TOPIC -----

This article describes the Macintosh 12-inch RGB Display, introduced 15 October 1990.

DISCUSSION -----

Not all Macintosh video sources will support the Macintosh 12-inch RGB Display. The following Apple video outputs support this monitor:

- Macintosh Display Card 4/8 and 8/24 video card
- Macintosh IIci built-in video
- Macintosh LC built-in video
- Macintosh IIsi built-in video

All previous video cards do not work with the Macintosh 12-inch RGB Display. At the time these cards were developed, the timing for the 12-inch RGB was not known and, therefore, does not support the proper video signaling.

In addition, the Macintosh Display Card 8/24 GC card does not work with the Macintosh 12-inch RGB Display. The card is designed for high-end systems, and the 12-inch RGB Display for inexpensive systems.

## Macintosh LC and Macintosh IIsi: Sound Input

Revised: 6/21/93  
Security: Everyone

Macintosh LC and Macintosh IIsi: Sound Input

Article Created: 16 October 1990

### Article Change History

06/21/93 - REVIEWED

- To confirm specifications of Sony and Radio Shack cables.

### TOPIC -----

This article is about the sound input circuitry for the Macintosh LC and Macintosh IIsi.

### DISCUSSION -----

The Macintosh LC and Macintosh IIsi computers have built-in mono 8-bit sound input circuitry. This hardware is supported by the System 7.0 Sound Manager, which is included in System 6.0.7.

An electret microphone and a plastic holder to attach the microphone to the front of a monitor are included with the system. The microphone has a male miniature stereo phone connector. Customers can use any commercially available microphone that does not require an external power source.

An attenuated RCA adapter cable, with a male miniature phone connector on one end and two female RCA connectors on the other steps down the voltage level of the incoming signal. Devices such as CD players or tape players provide line out signals at a higher level than the 20 millivolt - 600-ohm impedance expected by the sound input circuitry. If you use a non-attenuated RCA adaptor cable in the audio-in jack, you will not hurt the system and it will still digitize the signal, but it may be very distorted.

If you use an attenuated RCA adapter cable as an audio-out cable, it may or may not work, depending on what you're connecting to. A standard RCA adapter cable is recommended for audio out. If the microphone is plugged

into the audio-out jack, no sound will come out of the jack or the internal speaker.

Both Sony and Radio Shack sell attenuated RCA cables. The Sony part number is RK-G128 and the Radio Shack part number is 42-2461-A.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## Macintosh Classic: Specifications (Discontinued 10/91)

Revised: 9/27/93  
Security: Everyone

Macintosh Classic: Specifications (Discontinued 10/91)

=====

Article Created: 23 October 1990

TOPIC -----

This article gives the specifications for the Macintosh Classic computer.

DISCUSSION -----

### CENTRAL PROCESSING UNIT (CPU)

- Microprocessor: 8 MHz MC68000 CPU
- Internal architecture: 32-bit

### OPERATING SYSTEM

- Macintosh System Software 6.0.7 or later

### MEMORY

- 1 or 2 MB RAM (Random Access Memory), up to 4 MB using Macintosh Classic 1MB Memory Expansion Card and 150ns, or faster, 32-pin SIMM
- 512K of ROM (Read-Only Memory)
- 256 bytes of parameter memory with built-in battery backup

### KEYBOARD

- Apple Keyboard II (included with the Classic system)

### MOUSE

- Apple Desktop Bus (ADB) Mouse, mechanical tracking, optical shaft or contact encoding 100 +/- 10 pulses per inch (3.94 +/- 0.39 pulse per mm) of travel

### DISK DRIVE

- One 1.4 MB high-density (Apple SuperDrive) internal drive. (Optional external 1.4 MB or 800K disk drive available)

The disk port on the Macintosh Classic supports the Apple 800K External Drive but not the 400K drive.

#### HARD DISK DRIVE

- A 3.5-inch 40 MB drive is available. The disk port on the Macintosh Classic supports the Apple HD20.

#### MONITOR

- Built-in 9-inch diagonal, 512 by 342-pixel high-resolution bit-mapped monochrome display

#### INTERFACES

- One Apple Desktop Bus (ADB) connector for keyboard, mouse, and low-speed input devices
- Two RS-232/RS-422 serial ports, 230.4K baud maximum (up to 0.920 Mbit per second if clocked externally)
- SCSI interface
- External 3.5-inch disk interface
- Stereo sound port for external audio amplifier or headphones

#### SOUND GENERATION

- Four-voice sound with 8-bit digital-analog conversion using 22KH sample rate capable of driving stereo headphones or other stereo equipment through the sound jack

#### FAN

- 10 CFM axial, positive pressure cooling

#### CLOCK/CALENDAR

- CMOS custom chip with long-life lithium battery

#### ELECTRICAL REQUIREMENTS

- Line voltage: 120 volts AC, RMS automatically configured (U.S./Japan)  
240 volts AC, RMS automatically configured (International)
- Line frequency: 47 to 63 hertz single phase
- Power consumption: 100 watts maximum

#### ENVIRONMENTAL REQUIREMENTS

- Operating temperature: 50 to 104 degrees F (10 to 40 C)
- Storage temperature: -40 to 116.6 degrees F
- Relative humidity: 5% to 95% (non-condensing)
- Altitude: 15,000 ft (4,772 m)

#### SAFETY AND EMI QUALIFICATIONS

- FCC part 15 Class B Computing Devices
- UL 1950 Information Technology Equipment
- CSA (Canadian Standards Assn.) 950 Information Technology Equipment

#### SIZE AND WEIGHT

- Main Unit
  - Height: 13.2 inches (33.6 cm)
  - Width: 9.7 inches (24.6 cm)
  - Depth: 11.2 inches (28.5 cm)
  - Weight: 16 to 17.1 lbs. (7.3 to 7.8 kg) not including internal hard disk
- Apple Keyboard II

- Height: 1.3 inches (3.3 cm)
  - Width: 16.0 inches (40.5 cm)
  - Depth: 5.9 inches (15.1 cm)
  - Weight: 1.96 lbs. (0.89 kg)
- 
- Apple Mouse (ADB)
    - Height: 1.1 inches (2.8 cm)
    - Width: 2.1 inches (5.3 cm)
    - Depth: 3.8 inches (9.7 cm)
    - Weight: 6 oz. (.17 kg)

## Macintosh LC, IIsi: Keys Take Place of Programmer's Switch

Revised: 7/16/92  
Security: Everyone

Macintosh LC, IIsi: Keys Take Place of Programmer's Switch

=====

Article Created: 16 October 1990  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 14 March 1991

TOPIC -----

This article gives the keystroke combination that takes the place of the programmer's switch on the Macintosh LC and Macintosh IIsi.

DISCUSSION -----

The Macintosh LC and Macintosh IIsi do not have a programmer's switch. Here are the key combinations for the Reset and non-maskable interrupt (NMI) functions:

- Control-Command-Power generates a reset.
- Command-Power generates an NMI.

Note: MacsBug 6.2b1 or later (available from APDA) needs to be installed for the non-maskable interrupt to happen when the Command and Power keys are pressed.

These key combinations are similar to those used in the Apple IIGS.

## Macintosh Classic: RAM Upgrades and 1MB Memory Expansion Card

Revised: 6/18/92  
Security: Everyone

Macintosh Classic: RAM Upgrades and 1MB Memory Expansion Card

Article Created: 16 October 1990  
Article Last Reviewed: 16 June 1992  
Article Last Updated:

TOPIC -----

How do I upgrade the RAM in my Macintosh Classic? What are the possible configurations and do I have to use the 1MB Memory Expansion Card?

DISCUSSION -----

With the Macintosh Classic, Apple introduced a new memory expansion module called the Macintosh Classic 1MB Memory Expansion Card. This card is necessary to add additional RAM to a Macintosh Classic. A 2MB Macintosh Classic comes with this card installed.

Apple's memory expansion card has 1MB of memory soldered on. In addition, it carries two SIMM sockets to allow expansion with 150ns (or faster) 256K or 1MB SIMM strips (Macintosh Plus or Macintosh SE SIMMs or better). Both SIMMs must be populated at the same time with the same size RAM SIMMs in both sockets. Either low- or high-profile SIMMs can be used. A jumper must be changed if the SIMM sockets are used. You cannot use 4MB RAM SIMMs.

The following are valid memory configurations:

- 1 MB - Using 1MB on main logic board (MLB) only
- 2 MB - 1MB on MLB plus 1MB memory expansion card with no SIMMs
- 2.5 MB - 1MB on MLB plus 1MB memory expansion card with two 256K SIMMs
- 4 MB - 1MB on MLB plus a 1MB memory expansion card with two 1MB SIMMs

As with the Macintosh Plus and SE, the Classic's system memory can be extended only to 4MB. In the memory map, after the 4MB RAM space, there is the system ROM.

Macintosh LC: Expansion Slot

=====  
Article Created: 16 October 1990  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

TOPIC -----

This article is about the Macintosh LC's PDS (processor-direct slot) expansion slot.

DISCUSSION -----

You can expand the Macintosh LC via a 96-pin expansion connector located on the main logic board. This is Apple's first 68020 PDS, requiring a new slot definition. Expansion cards will be approximately 3-inches by 7-inches in size and will lie horizontally above the logic board within the Macintosh LC. An opening in the back of the Macintosh LC accommodates a connector the size of a DB-15. The expansion connector is supplied with the following voltages, and must be limited to the following current load:

| Voltage | Current |
|---------|---------|
| -----   | -----   |
| +5      | 800 mA  |
| -5      | 20 mA   |
| +12     | 200 mA  |

Power limitations allow dissipation of no more than 4 watts, all of which can be taken from +5, or from any combination of the three voltages -- but the total cannot exceed 4 watts.

Here are the pinouts for the Macintosh LC PDS connector for columns A, B, and C:

## Macintosh LC: Specifications (Discontinued 3/92)

Revised: 9/27/93  
Security: Everyone

Macintosh LC: Specifications (Discontinued 3/92)

Article Created: 16 October 1990  
Article Last Reviewed: 23 July 1992

TOPIC -----

This article gives technical specifications for the Macintosh LC.

DISCUSSION -----

### MICROPROCESSOR

- 16 MHz MC68020 CPU

### MEMORY

- 2, 4, or 10 MB RAM (Random Access Memory)  
100 nanosecond DRAM
- 512 Kbytes of ROM (Read-Only Memory)
- 256 bytes of settable parameter memory

### KEYBOARD

- Apple Keyboard or Apple Extended Keyboard can be connected through the Apple Desktop Bus port

### MOUSE

- Apple Desktop Bus (ADB) Mouse, mechanical tracking, optical shaft or contact encoding 100 +/- 10 pulses per inch (3.94 +/- 0.39 pulse per mm) of travel.

### DISK DRIVE

- One 1.4 MB high-density (Apple SuperDrive) internal drive. Two internal, floppy drives are supported. The unit ships with the Apple SuperDrive, but the logic board also supports an 800K drive.

### HARD DISK DRIVE

- 3.5-inch 40MB hard drive configuration is available.

### INTERFACES

- One Apple Desktop Bus (ADB) connector for keyboard, mouse, and low-speed input devices.
- Internal 020 Direct Slot through a 96-pin Euro-DIN connector.
- Two RS-232/RS-422 serial ports, 230.4K baud maximum (up to 0.920 Mbit per second if clocked externally).
- Built-In Video DB-15 pin connector, supporting the following monitors:
  - + Apple High-Resolution Monochrome Monitor at 2, 4, 16 and 256\* grays
  - + Apple Macintosh 12" Monochrome Monitor at 2, 4, 16 and 256\* grays
  - + AppleColor High-Resolution RGB Monitor at 2, 4, 16 and 256\* colors/grays
  - + Apple Macintosh 12" RGB Monitor at 2, 4, 16 and 256 colors/grays
    - \* requires 512K VRAM upgrade
- SCSI interface
- Monophonic sound port for external audio amplifier
- Sound input port for monaural sound input

#### SOUND INPUT

- Monaural 8-bit sound
- Sound samples can be made at 22 or 11 kilohertz
- Macintosh Audio Compression Expansion (MACE) sound utility, supporting 3:1 or 6:1 compression, which allows approximately half an hour of sound to stored on a single 40-megabyte hard disk.

#### SOUND GENERATION

- Monophonic 8-bit digital-analog conversion using 22-kilohertz sample rate capable of supplying the same signal to both channels of stereo headphones or other stereo equipment through the sound jack.

#### FAN

- 10 CFM axial

#### MICROPHONE

Omnidirectional electret microphone

#### ELECTRICAL REQUIREMENTS

- Line voltage: 90 to 240 volts AC, RMS automatically configured
- Line frequency: 47 to 63 hertz single-phase
- Power consumption: 50 watts maximum, not including monitor power

#### ENVIRONMENTAL REQUIREMENTS

- Operating temperature: 50 to 104 degrees F (10 to 40 C)
- Storage temperature: -40 to 116.6 degrees F
- Relative humidity: 5% to 95% (non-condensing)
- Altitude: 0 to 10,000 ft (0 to 3048 m)

#### SAFETY AND EMI QUALIFICATIONS

- FCC part 15 Class B Computing Devices
- UL 1950 Information Technology Equipment
- CSA (Canadian Standards Assn.) 950 Information Technology Equipment

#### SIZE AND WEIGHT

- Main Unit
  - Height: 3.0 inches (7.7 cm)

- Width: 12.2 inches (31.0 cm)
- Depth: 15.0 inches (38.2 cm)
- Weight: 8.8 lbs. (4.0 kg)
- Apple Keyboard (included)
  - Height: 1.8 inches (44.5 mm)
  - Width: 16.5 inches (418.3 mm)
  - Depth: 5.6 inches (142.0 mm)
  - Weight: 2 lbs. 2 oz. (1 kg)
- Apple Extended Keyboard (not included)
  - Height: 2.3 inches (56.4 mm)
  - Width: 19.1 inches (486 mm)
  - Depth: 7.4 inches (188 mm)
  - Weight: 3 lbs. 10 oz. (1.6 kg)
- Apple Mouse (ADB)
  - Height: 1.1 inches (2.8 cm)
  - Width: 2.1 inches (5.3 cm)
  - Depth: 3.8 inches (9.7 cm)
  - Weight: 6 oz. (.17 kg)

## Macintosh LC: Video Timing

Revised: 7/23/92  
Security: Everyone

Macintosh LC: Video Timing

Article Created: 16 October 1990  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

TOPIC -----

This article gives the video timing modes for the Macintosh LC.

DISCUSSION -----

The Macintosh LC supports 3 different timing modes:

- Macintosh 12-inch RGB Display's 512x384
- Macintosh 12-inch RGB Display's 560x384 (generated by Apple IIe card, 4-bit only)
- Macintosh 12-inch Monochrome Display, Macintosh High-Resolution Monochrome, Macintosh High-Resolution RGB (640x480)

In 640x480 mode, Macintosh LC uses the CPU clock (31.3344 MHz) as the pixel clock. This is opposed to the 30.24 MHz clock that is normally specified. This results in 32 extra pixels per scan line. The 640 active pixels are centered in the active video field with 16 black pixels placed on either side. Horizontal and vertical scan rates remain the same. A visual distortion from square pixels will occur, making the pixels 3% too narrow. The Macintosh 12-inch Monochrome display will be able to correct for this distortion, but the current monochrome and RGB monitors will not.

The 560x384x4 Apple IIe mode is selectable only when an Apple IIe card is present. The card is necessary because the 17.234 MHz oscillator required for this video mode is located on the Apple IIe card itself.

## Old HD-20 and New Macintosh SE/30

Revised: 11/1/90  
Security: Everyone

Old HD-20 and New Macintosh SE/30

=====

This article last reviewed: 31 October 1990

TOPIC -----

What must one do to access a (non-SCSI) HD20 disk drive attached to the disk drive port on the new Macintosh SE/30? I tried placing the old "HD20" file in the System Folder, but it didn't work.

DISCUSSION -----

Using the criteria of "Macintosh SE/30 AND NON-SCSI" search AppleLink's Technical Info library for the article "Macintosh SE/30: Doesn't Work with an Apple Hard Disk 20." The following is more information on this subject:

The (non-SCSI) Hard Disk 20 does not work with the Macintosh SE/30. The Macintosh SE/30 has the same logic board and ROM as the Macintosh IIX, which does not support the Hard Disk 20. Therefore, the code to support the drive is not included in the ROM of the Macintosh SE/30.

There are ways of retrieving the data from a Hard Disk 20 for use on the Macintosh SE/30. First, using a Macintosh Plus or Macintosh SE, transfer the data to another hard disk that the Macintosh SE/30 can read. The necessary equipment and steps to do this are:

To transfer data from a Hard Disk 20 to the internal drive, these items are required:

- Macintosh Plus or Macintosh SE
- Formatted, blank HD20 SC, HD40 SC, or HD80 SC and cables
- System 6.0.3 Tools Disk (included with the Macintosh SE/30)

Once you have the necessary items, follow these steps:

- 1) Hook up the Hard Disk 20 and the HD20 SC, HD40 SC, or HD80 SC to the Macintosh Plus or Macintosh SE.
- 2) Insert the System Tools disk in the internal drive.
- 3) Turn on both drives, wait 10 seconds, and then turn on the computer.
- 4) Use the Find File DA and look for a file called System on the Hard Disk 20.
- 5) There should be one file called System, and it should be located in the System Folder. If there is more than one System file, return to the desktop and trash the other System files on the Hard Disk 20.
- 6) Select all the files and folders on the Hard Disk 20 and any files that may be on the desktop and drag them to the HD20 SC, HD40 SC, or HD80 SC.
- 7) After the copy is finished, hook up the HD20 SC, HD40 SC, or HD80 SC to the Macintosh SE/30.
- 8) Select the files from the HD20 SC, HD40 SC, or HD80 SC and drag them to the internal hard drive. If there is no internal hard drive, drag them to the drive you will be using.
- 9) Update the System files to System 6.0.3 using the Installer Script (located on the System Tools Disk) for the Macintosh SE/30.

Additionally, we have included an INIT Utility that reads the data from the Hard Disk 20 and puts it on the internal hard disk of the Macintosh SE/30. As with all INITs, place it in the System Folder of the startup disk. The Hard Disk 20 will now be visible when you start up with the Hard Disk 20 turned on.

Warning: Do not try to write to the Hard Disk 20. Trying this can result in the loss or corruption of data on the Hard Disk 20.

When the Hard Disk 20 icon is visible, you can drag the files from the Hard Disk 20 onto the internal hard disk of your Macintosh SE/30.

The code for the INIT Utility is not supported by Engineering, and no changes will be made to it. Be very careful when using this Utility and do not distribute it. Once you have copied the Hard Disk 20 to your Macintosh SE/30, be sure to remove this Utility from your System Folder.

## A/UX 2.0 and Native X11: Frequently Asked Questions (11/95)

Revised: 11/29/95  
Security: Everyone

A/UX 2.0 and Native X11: Frequently Asked Questions (11/95)

=====

Article Created: 8 October 1990  
Article Reviewed/Updated: 28 November 1995

TOPIC -----

This article contains frequently asked questions (FAQ) about A/UX 2.0 and Native X11.

DISCUSSION -----

Question: Can you configure "native" X11 to use an "azerty" keyboard?

Answer: On an "xterm" window, we think that the X client application called "xmodmap", a keyboard modifier utility for X, could be used to alter the X keyboard map and key symbol table. For example, on a standard Apple Macintosh keyboard, to change the capital letter "A" to a capital letter "Q", you would use the command: `xmodmap -e "keycode 20 = A"`.

For more details, please see the xmodmap (1) manual pages.

Question: How can I configure "native" X11 to have a 24-bit display?

Answer: The current distributed Macintosh A/UX "native" X server, which is based on X11R4, supports only 1-bit (monochrome) and 8-bit (8 bits per pixel, 256 colors) displays.

## A/UX 2.0: apropos dt

Revised: 11/9/92  
Security: Everyone

A/UX 2.0: "apropos dt"

=====

Article Created: 8 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

"apropos dt" yields nine occurrences of the line "Mon Apr 23 xx:xx:xx PDT 1990". This is a minor annoyance, but why does it happen?

### DISCUSSION -----

The repeated time-stamped "Mon Apr 23 xx:xx:xx PDT 1990" lines displayed with the "apropos dt" command are caused by the /usr/lib/whatis database file. The "apropos dt" displays any line matched with the "dt" string (not case sensitive) from the /usr/lib/whatis file. The workaround to this minor annoyance is to remove these time stamp lines from the /usr/lib/whatis file.

## A/UX 3.0: Configuring sendmail (10/95)

Revised: 10/16/95  
Security: Everyone

A/UX 3.0: Configuring sendmail (10/95)

Article Created: 8 October 1990  
Article Reviewed/Updated: 16 October 1995

TOPIC -----

I have some problems using mail on TCP/IP with A/UX 3.0.

I can receive messages, but I can't send them. When I use "mailq" to see the messages in the queue, I see: "Deferred: Host Name Lookup Failure" for all messages I tried to send. I haven't modified the mail configuration files. I just wrote the name of the remote host on "/etc/hosts" to use on the mail command. I know the connection works fine on the host supporting A/UX because I can use Telnet, ftp, and so on.

Can you help?

DISCUSSION -----

As shipped, A/UX 3.0 works only with local mail. To get either UUCP or network mail working, you need to reconfigure the /usr/lib/sendmail.cf file. To use the TCP/IP-based (Ethernet) mail, you must have a nameserver running on the network.

NOTE: With A/UX 3.1 these changes are not necessary.

If a fully qualified domain name is the only form of mail address that a user on the computer will generate, modify the file /usr/lib/sendmail.conf/cf/aux.mc so that it contains your Internet domain name. Here is the line to change, as installed from the standard A/UX distribution:

```
define(DOMAIN, 'DDaux.apple.com')
```

Change aux.apple.com to your Internet domain name as specified in the /etc/resolv.conf file.

After modifying aux.mc, enter this sequence of commands to make a new sendmail

configuration file:

```
cd /usr/lib/sendmail.conf/cf
```

```
make aux.cf
```

The result of the make command is a file called aux.cf. Move aux.cf to the configuration filename that sendmail uses, by entering this command:

```
mv aux.cf /usr/lib/sendmail.cf
```

Now startup sendmail by typing:

```
/usr/lib/sendmail -bd -q30m
```

The -bd option causes sendmail to run as a daemon. The -q30m option causes sendmail to process the local mail queue every 30 minutes.

Refer to the A/UX Network System Administration manual chapter on Setting Up Network Mail for further details.

## A/UX: Frequently Asked Questions (11/95)

Revised: 11/28/95  
Security: Everyone

A/UX: Frequently Asked Questions (11/95)

=====

Article Created: 8 October 1990  
Article Reviewed/Updated: 28 November 1995

TOPIC -----

This article contains frequently asked questions (FAQ) about A/UX?

DISCUSSION -----

Question: Do customers get the source code for A/UX and X Windows?

Answer: No, the source code is not included in the normal distribution of A/UX and X Windows System. However, it will be available from APDA on special request when released. As far as we know, the source for the current release of A/UX 3.0 has not been made available to APDA. The information for source won't be listed on the APDA catalog since it is a special request item and it requires lots of "License Agreement Signatures".

Question: Does the TCP/IP implementation follow "Host requirements (RFC 1122 and 1123)"?

Answer: According to A/UX Network Engineering, A/UX 3.0 TCP/IP implementation does follow the RFC 1122 and RFC 1123 (Host requirements).

Question: Does the NFS implementation have the same functionality as SunOS 4?

Answer: The NFS implementation under A/UX runs the same NFS version (protocol release 2.0 and implementation source 3.2) as SunOS 4.0.x does. However, the "mount daemon" feature (which is supported in SunOS 4.0.x) is not included.

Question: Can you give quota restrictions on users over NFS?

Answer: No disk quota on users is implemented under the A/UX Berkeley file

system.

Question: What backup system do you recommend?

Answer: A/UX supports Apple Tape Backup 40SC. You can also use Dantz Retrospect and any backup media they support.

Question: Is the X Window System 11.3 or 11.4 (I have read that some parts are 11.4)?

Answer: The current release of X Window System for A/UX 3.0 is based on 11R4.

Question: Do the GNU products run on A/UX (GNU-EMACs, gcc, g++)?

Answer: We have heard that some people on the network have run GNU products on A/UX.

Question: Do the "cdb" and "adb" debugging programs have the same functionality as "dbx"?

Answer: "cdb" and "xdb" are third-party products. We haven't tried them nor compared their functionality. However, we know that "cdb" is an interactive, source-level debugger for C and assembly-language programs, and it supports programs generated from the C compiler included with A/UX or from third-party compilers that generate Common Object File format symbol tables.

Question: Is the C implementation compliant with ANSI X3J13?

Answer: The A/UX C compiler is not compliant with ANSI X3J13.

Question: Is there a C++ (AT&T Cfront 2.0)?

Answer: Try Oasys's C++.

Question: Is there a Pascal compiler (compliant with the ISO-standard)?

Answer: This is not supported by Apple. Look for third-party solutions.

Question: Is there a Cross assembler for MC68020 systems?

Answer: This is not supported by Apple. Look for third-party solutions.

Question: Is the ADA cross compiler compliant with ANSI-83?

## ..TIL06187-A-UX-Frequently\_Asked\_Questions\_11-95\_(TA44751).pdf

Answer: This is not supported by Apple. Look for third-party solutions.

Question: Is there a system for delaying execution of processes to a later time (some sort of "batch system")?

Answer: The "cron" or "at" under A/UX allows you to schedule tasks for later time.

Question: Are there tools for distributed programming (similar to SUN ONC or Apollo NCA)?

Answer: This is not supported by Apple. Look for third-party solutions.

## A/UX 2.0: Troubleshooting AppleShare File Server Access Problem

Revised: 11/10/92  
Security: Everyone

A/UX 2.0: Troubleshooting AppleShare File Server Access Problem

Article Created: 8 October 1990

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I have A/UX 2.0 running on a Macintosh IIfx with 5MB RAM and an HD160 SC. I can access the LaserWriters on the network easily from the Chooser and CommandShell, but I'm having a problem accessing the file servers. I am using a LocalTalk-only connection. The file servers appear in the services window on the right side of the Chooser window just as they do while I'm in Macintosh OS, and I can mount those servers while in Macintosh OS.

I noticed that the bottom right area of the Chooser window did not have the normal text/buttons included--"AppleTalk; ON; OFF". When I try to mount the file servers while in A/UX, the system shows the watch cursor and gives this alert message: "No response from server. Please try again."

Can you help?

### DISCUSSION -----

Unfortunately, we can't reproduce this symptom. We are running AppleTalk via a LocalTalk-only connection without any problem. Both printing and AppleShare services work properly.

It sounds strange that you can access the LaserWriter but not the AppleShare server on the AppleTalk network.

When an AppleShare server is selected, the bottom right area of the Chooser window should show an "OK" button and a "User Name" input dialog box. We don't

see the "AppleTalk; ON; OFF" text in the window.

Here are some areas to check:

- Is the server you tried to mount up and running? Did you get the same "No response from server ..." message when you select another server?
- Is the Apple Internet Router running AppleTalk Phase 2?
- Make sure that the default port for AppleTalk via LocalTalk is the printer port (tty1), which must be set with the getty disabled.
- Make sure that the "interface = localtalk0" line in /etc/appletalkrc is set.
- When AppleTalk is shutdown via "appleTalk -d" and you try to bring it up again, the Mac 32 environment needs to be run again to make AppleTalk effective again. This can be done using the "Logout" and "mac32; screenrestore" sequences or by restarting the system.
- Use "appleTalk -s" to see the AppleTalk status.

## MacX and xgif: Why Color Table Change Causes Slow Display

Revised: 4/20/93  
Security: Everyone

MacX and xgif: Why Color Table Change Causes Slow Display

=====

Article Created: 8 October 1990

### Article Change History

-----

04/20/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

Why is MacX so slow when a client changes the color table? The change of a single table entry seems to cause a substantial delay in the displayed pixel and is accompanied by some strange color changes in the current table (for example, color flashes).

What is the problem? Is there a way around this so that the display update is as clean and fast as the stand-alone X11 server?

### DISCUSSION -----

The problem that you are experiencing is most likely due to the way the X client application uses the Color Lookup Map. We have seen a difference between the two versions of the xgif program. The old version of xgif (which uses the default colormap) causes the most slowness. The new version (which uses the colormap routine in the Xlib) behaves much faster. Here are examples of C code used by the two versions of xgif:

Old version:

```
#define DefaultColormap(pty, scr) (((dpy)->screens[(scr)]).cmap)
theCmap = DefaultColormap(theDisp, theScreen);
```

New version:

```
theCmap = XCreateColormap(theDisp, rootW, theVisual, AllocNone);
```

We also experienced similar effects (color flashing and/or changing) on the

Native X11 server.

## Apple GS/OS Error Messages: Where to Find Explanations

Revised: 10/29/90  
Security: Everyone

Apple GS/OS Error Messages: Where to Find Explanations

=====

This article last reviewed: 8 October 1990

TOPIC -----

I am trying to copy files from an Apple IIGS to an Apple HD40 SC. The Apple IIGS consistently returns the error message 8020. I cannot find this error message anywhere.

- 1) What is the error message?
- 2) Where can I find a definitive article on GS/OS error messages?

DISCUSSION -----

- 1) The error description is "invalid request." The programmer's constant is "DrvrbadReq". Since the error number is 8020 instead of 0020, the error is coming from the Finder, not directly from GS/OS. An error code directly from GS/OS would be in the format of "00xx". An error code passing through the Finder has the high bit set and produces a format of "80xx". Where "xx" is the actual error code.
- 2) Both Volume 1 and Volume 2 of the "GS/OS Reference" has an Appendix E containing the GS/OS error codes and the message related to that code. The individual system call description indicates which GS/OS errors that call may return. System Loader error messages are given within the System Loader call description section.

## Apple IIGS: Does Not Output Serial Data to Printer Problem/Cure

Revised: 10/29/90  
Security: Everyone

Apple IIGS: Does Not Output Serial Data to Printer Problem/Cure

=====

This article last reviewed: 25 October 1990

Problem: Printer does not print when properly configured with an Apple IIGS and connected to the built-in serial port.

Before you start:

- Familiarize yourself with Apple IIGS technical procedures
- Perform diagnostics per technical procedures

Perform the following in the event that diagnostics did not yield a serial port failure:

Cure 1: A problem might exist with printer switch settings or Apple IIGS Control Panel settings.

Action: Check DIP switch settings on printer and built-in control settings on the computer (see note 1). Reconfigure switches and/or control settings in the computer. Test the system by printing a file to the printer.

Cure 2: A problem might exist with the serial port circuitry that is not being detected by performing diagnostics.

Action: Remove and replace the logic board with a known-good exchange module. Test by printing a file to the printer.

Note 1: The Apple IIGS Control Panel settings can be reset to their defaults by holding down the Ctrl - Command (Open Apple) keys and then pressing the reset key. When the menu appears, select option #2, which says, "Set system standards and 60Hz". The system then automatically re-boots.

## 800K Eject INIT: Not Needed with 400K Drives

Revised: 4/18/91  
Security: Everyone

800K Eject INIT: Not Needed with 400K Drives

=====

This article last reviewed: 9 October 1990

TOPIC -----

Does the Apple 800K Eject INIT "park" 400K drives?

DISCUSSION -----

The 800K Eject INIT does not need to "park" the head of a 400K drive. The problem this patch is intended to fix occurs only with the upper head assembly when the disk shutter catches on the upper head as the disk lifts and ejects. Because the 400K drive has only a lower head assembly, there is no danger, and it isn't necessary to park its head. This also holds true for the patch included in System Software 6.0.4 and later Systems. The heads of 400K drives are not parked.

## HyperSpeller XCMD Available for HyperCard

Revised: 10/29/90  
Security: Everyone

HyperSpeller XCMD Available for HyperCard

=====

This article last reviewed: 9 October 1990

TOPIC -----

Do you know of any spell checkers that work with HyperCard?

DISCUSSION -----

HyperSpeller by Foundation Publishing is a utility that adds spell-checking and search/replace capabilities to HyperCard. HyperSpeller is implemented as two external commands (XCMDs): SpellCheck and FindChange. An installer application places the externals in the Home stack. After installation, SpellCheck and FindChange commands can be issued from HyperCard's message box or a HyperTalk script. The HyperSpeller dictionary file is approximately 164K. It must reside in the System Folder or the same folder as HyperCard.

The user can specify the checking range. For example, "SpellCheck" for the entire stack, "SpellCheck 30" for card 30 on, and "SpellCheck 12,12" for card 12 only. The dialog box clearly states where the suspect word is found. The user can then ask for suggestions, click on the Learn button, or Skip the word to ignore it. A small text box in the dialog shows a limited amount of the context in which the suspect word is found. For users with small monitors, the spelling dialog box can be "zoomed" smaller or larger, allowing the HyperCard card to be more visible.

The FindChange feature gives search and replace capabilities to HyperCard. The Find/Change dialog allows the user to specify "whole word", "match case", "change all", and "Change, then Find". As with the SpellCheck dialog, there is a zoom box that makes the dialog smaller or larger.

For more details, search the Technical Info library under "Foundation Publishing".

Data Access Language (DAL) Server Compatibility

=====

Article Created: 29 October 1990  
Article Last Reviewed: 30 June 1992  
Article Last Updated:

TOPIC -----

Are versions 1.1 and 1.2 of the CL/1 Server for VMS compatible with AppleTalk for VMS 3.0?

DISCUSSION -----

The existing versions of the CL/1 Server for VMS are 1.0 and 1.1, which are compatible only with AT VMS 2.0, 2.0.5, 2.0.6, and 2.1; not 3.0.

The Data Access Language Server for VMS version 1.2 is shipping as part of DEC PATHWORKS (formerly LanWORKS) for Macintosh, which includes AppleTalk for VMS 3.0. If purchased separately, DAL 1.2 is supported under ATVMS 3.0 OR any one of 2.0, 2.0.5, and 2.0.6 (but not 2.1).

Please note that the DAL Client requires a DAL Server. It will not connect successfully to an existing CL/1 Server, and a CL/1 Client will not work with a DAL Server. DAL Server/Client 1.2 will replace existing CL/1 Server/Client 1.1. The released version of PATHWORKS for Macintosh includes DAL Server/Client 1.2.

PATHWORKS for Macintosh (including AppleTalk for VMS 3.0) has been shipping since early autumn 1990 as has DAL Server/Client 1.2.

## Macintosh-to-Tandem Connectivity: Distributed Sessions

Revised: 10/29/90  
Security: Everyone

Macintosh-to-Tandem Connectivity: Distributed Sessions

=====

This article last reviewed: 9 October 1990

TOPIC -----

I need a gateway product to give networked Macintosh computers access to Tandem computers. Essentially, I am looking for a NetWay 2000-type product for Tandem computers.

DISCUSSION -----

For terminal emulation, TCP/IP and Telnet are available from Tandem. MacMenlo, from Menlo Business Systems, won't work over TCP/IP, but you can do TTY with TCP/Connect, from Intercon, or even with NCSA's Telnet.

For message passing, we suggest, in addition to TCP/IP, a MacX25 Server. This works relatively well.

## Macintosh-to-Sun/UNIX File Transfer

Revised: 10/30/90  
Security: Everyone

Macintosh-to-Sun/UNIX File Transfer

=====

This article last reviewed: 9 October 1990

TOPIC -----

We have a high-end Crossfield Studio color scanner/separation system that I am expanding to provide for a Macintosh front-end. We recommended a Macintosh IIx with an Ethernet NuBus card and K-AShare file server software to communicate with a Sun SPARCstation (K-AShare is AFP-compatible file server software for UNIX hosts and is sold by Mt. Xinu.)

The reason for the Sun is that the RIP software (StudioLink 2.0) runs only in a UNIX environment. The purpose of the RIP software is to translate the PostScript files from the Macintosh into a native bitmap file that the Crossfield Studio system can understand.

The proposed functionality of the Macintosh-to-Sun link is to provide file transfer to and from the Sun. Once a file is transferred to the Sun, it's archived on a hard disk for eventual processing by the Crossfield system. The Crossfield system is configured around a PDP mini-computer running RSX 11M Version 4.2 operating system. For tying the Sun and PDP systems together, both Digital and Crossfield recommended using DECnet over Ethernet.

Should we have DECnet connecting the Macintosh to the Sun? Is the use of K-AShare an appropriate choice, or is there a better way to connect a Macintosh to a UNIX machine for file transfer capability?

DISCUSSION -----

You should be able to do file transfer between the Macintosh and the Sun using either TCP/IP, DECnet, or the K-Ashare product.

The native networking protocol on the Sun platform is TCP/IP, so you can run MacTCP to communicate between the Macintosh and the Sun.

There are products like TSSnet that allow DECnet on the Macintosh. Sun does provide DECnet on their machines, but we believe you have to pay extra for it.

There should be no compatibility problems for the Sun running all these protocols, because they can share the same Ethernet.

More importantly, there are two things you should take into consideration:

- 1) Select the product that provides the easiest way for the Macintosh users to transfer files to the Sun. With an AFP-compatible file server, the Macintosh users can just drag the file to the server icon. Using TCP/IP or DECnet, they would need to learn FTP or DECnet COPY, which are not too complicated, but less Macintosh-like.
- 2) Once the file is transferred to the Sun, can the StudioLink/Crossfield system process the file without any problems? Remember a Macintosh file has a resource fork and a data fork. A minicomputer-based AFP-compatible server stores these as two separate files. Some tests should be done to ensure that the data fork portion file can be processed by the StudioLink/Crossfield system. Also, test to ensure that, if the file needs to be accessed by the Macintosh users afterwards, this can be done.

## Data Access Language (DAL) Developer Issues

Revised: 7/21/92  
Security: Everyone

Data Access Language (DAL) Developer Issues

=====

Article Created: 30 October 1990  
Article Last Reviewed: 29 June 1992  
Article Last Udated:

TOPIC -----

We have some questions about the use of Data Access Language (DAL).

- 1) DAL can be ordered from APDA. Does this mean that there will be considerable development work needed when using DAL in the scheme of database access?
- 2) Using ClearAccess, how much programming and level of knowledge is needed to access Rdb on the VAX system? What utilities or "hooks" are available from DAL that will let me access Rdb via ClearAccess? Do I need to know DAL well before I can use ClearAccess to access the Rdb database?
- 3) Can our resellers just sell DAL like they do with other applications (like EtherTalk NB Cards, or TokenTalk NB Cards, and so on)? From what I understand, it seems that DAL is a useful tool only if the person using DAL really understands database systems and using DAL utilities to extract and update the information.
- 4) This pertains to using DAL. If I have a 4th Dimension flat file, and I want to send it to the Rdb database to have it stored as an Rdb record, what must I do and what is the prerequisite (knowledge or software/hardware requirements) before I can do this transfer? Do I, for example, need to convert this 4th Dimension file into an Rdb-readable format for it to update the Rdb record?

DISCUSSION -----

- 1) Yes, Data Access Language is a development language, and development work is involved to link desktop applications to data processing systems on mainframes and minis. However, for commercial and

custom developers, Data Access Language lowers barriers to entry for them. Thus, products and custom solutions can be developed faster/easier because less detailed technical knowledge is required.

Data Access Language is often described as a standard connectivity language that links desktop applications to host data. It is more than just a language; it is really a group of carefully inter-related elements. The elements are the Language, the API, and the Development Aids. Often, the user wants access to different systems without having to worry about protocols, systems, or anything else. Relational databases are becoming more popular because of their ease of use, ease of administration, and application independence. SQL language emerges as a convention for data access language adopted by relational database vendors. SQL, however, is still not a standard. DAL lets software developers create desktop applications with seamless connectivity to DP data and applications without leaving the desktop world. It handles physical network specifics, insulates the desktop application from the operating system, RDBMS, and SQL specifics.

- 2) The ClearAccess DAL interface provides a series of dialog boxes that let users build queries by pointing and clicking. Users do not need familiarity with all the details of DAL or SQL. End users without knowledge of programming and SQL can access the databases via the dialog boxes, which build the SQL statements for them. The amount of knowledge required really depends on how complex the database access is going to be. A background in relational databases would also help.
- 3) Again, it really depends on the solutions. For simple ad-hoc queries and databases updates, DAL with a HyperCard or ClearAccess interface will let end users do the job without a lot of training. For complex, customized business applications that need to take advantage of the Macintosh interface, some serious planning and design should be done. Large companies with an in-house MIS programming staff should be able to do this task.
- 4) You can tell 4th Dimension to export this file with certain delimiters, transfer the file to the VAX, and import it into Rdb. This can be done without using DAL. You must be familiar with the export capabilities of 4th Dimension, know how to transfer the file to the VAX, and know how to import it into VAX/Rdb.

If this is going to be done by end users on a routine basis, please note that DAL provides 4th Dimension External procedures that let 4th Dimension applications act like CL/1 clients and create distributed applications on the Macintosh. You must know how to program 4th Dimension External procedures to export the data to the DAL server on the VAX host. You should also know how to install the DAL software on both the VAX and the Macintosh and the standard network connection between the Macintosh and VAX host.

## AppleTalk Phase 2: SNAP Encapsulation with OUI=0

Revised: 10/30/90  
Security: Everyone

AppleTalk Phase 2: SNAP Encapsulation with OUI=0

=====

This article last reviewed: 9 October 1990

TOPIC -----

My problem is that the AppleTalk Phase 2 ARP uses a SNAP encapsulation with an OUI=0 ("Organizational Unique Identifier"). Because Translating FDDI/Ethernet bridges use this OUI to pass Ethernet 2 packets to FDDI and back, an AppleTalk ARP gets converted to an Ethernet 2 packet when passed from FDDI to Ethernet. This packet format is not accepted by Apple host implementations. Therefore, it's not possible to use AppleTalk Phase 2 with FDDI with translating bridges between two AppleTalk hosts.

We need a solution.

DISCUSSION -----

The all-zeros "Organizational Unique Identifier" (OUI) was not specifically intended to be used for translating Ethernet frames to 802.2/SNAP. Its original intent was (and is) not completely clear; all that was generally agreed upon was:

- 1) The low-order 16 bits of the SNAP protocol discriminator indicated an Ethernet protocol type.
- 2) The format of the data part of the SNAP packet was the same as the format of the data part of the Ethernet packet of this protocol type.

This "general agreement," as far as we know, was never written down. AppleTalk Phase 2 and TCP/IP both adopted this convention. The unfortunate difference is that, on an Ethernet/802.3 data link, AppleTalk Phase 2 runs on top of 802.3 (and 802.2) and TCP/IP runs on top of Ethernet. Thus, for a TCP/IP Ethernet node to communicate with a TCP/IP 802.2 node (on Token Ring or FDDI, for example), some type of packet translation must be done. On the other hand, for an AppleTalk Phase 2 Ethernet node to communicate with any other AppleTalk Phase 2 802.2 node (on Ethernet, Token Ring, or FDDI), no such translation is

necessary (in fact, such translation MUST NOT occur).

This makes it somewhat difficult to build a bridge that "transparently" allows both forms of communication. However, all that really has to be done is for the bridge to contain a small table of Ethernet protocol types that either should, or shouldn't, be translated in this manner. Obviously, the smaller the table, and the less translation done, the better the overall performance. Any bridge between Ethernet and an 802 media that does not translate any OUI zero packets will prevent TCP/IP nodes (and any others using the same OUI convention) from communicating between the two media. Any bridge between Ethernet and an 802 media that translates all OUI zero packets will prevent AppleTalk nodes (and any others with an OUI of zero that don't expect translation) from communicating between the two media. In both cases, routers can, of course, be set up to accomplish the communication.

A somewhat equivalent problem could exist if two bridges are used to connect two Ethernet/802.3 data links across an 802 backbone (say, FDDI). In this case, some type of translation/encapsulation of Ethernet (non-802.3) packets must be performed to allow them to be passed across the 802 backbone. There are many ways to do this, one of which seems to be translating all Ethernet packets to OUI zero packets, shipping them across the backbone, and then converting them back. This, however, does not work for any OUI zero packets that start out on the Ethernet/802.3 data link. Such packets will not be translated on the way into the backbone, but will be incorrectly translated before being delivered on the destination Ethernet. Such packets should be forwarded entirely without translation.

In terms of actual product implementations, unfortunately, DEC is already testing an Ethernet-to-FDDI bridge that translates all OUI zero packets and, thus, does not work with AppleTalk Phase 2. They are aware of this issue. At the recent 802 meetings in Denver, it became clear that this type of translation is not part of the 802.1d (Macintosh Bridging) standard, but is something that many bridge manufacturers want to include as a non-802-standard option with their products. Most have said that they will have some type of translation (or non-translation) table to ensure that it works with all known protocols.

## Serial Line Interface Protocol (SLIP) and MacTCP

Revised: 11/1/90  
Security: Everyone

Serial Line Interface Protocol (SLIP) and MacTCP

=====

This article last reviewed: 9 October 1990

TOPIC -----

I heard that Apple supports SLIP (Serial Line Interface Protocol) added on to MacTCP. Could you explain SLIP? Will MacTCP (future versions) support SLIP?

DISCUSSION -----

SLIP is an asynchronous, serial line protocol developed for running TCP/IP over serial communications lines in a point-to-point configuration. SLIP was developed to transmit IP packets over low-speed, sometimes noisy, asynchronous communications lines where error recovery and an efficient line protocol are needed. The SLIP protocol is now being replaced with a new serial line protocol named "PPP", which uses a more efficient means of establishing a point-to-point IP connection.

MacTCP 1.0.2 includes hooks that let third-party developers write different link-layer modules. This makes possible the development of interfaces to SLIP, PPP, and to any other link layer that someone may need, like broadband, X.25, FDDI, and so on. Apple does not provide support in MacTCP for SLIP or any other serial line protocol; these have to come from third-party developers.

## A/UX 2.0: Display Card 8/24 in a Macintosh IIfx

Revised: 11/10/92  
Security: Everyone

A/UX 2.0: Display Card 8/24 in a Macintosh IIfx

=====

Article Created: 31 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I thought that the Display Card 8/24 supported the Two-Page Monochrome Monitor under A/UX 2.0, provided you use 1-bit mode. But I have an installation where this did not work. The system was a Macintosh IIfx (upgraded from a Macintosh II). A/UX was supplied as an official released seed version of 2.0. Knowing that there were some early beta cards that would not work, I checked the card. It was clearly labeled "trident" and was ordered through regular channels (no indication of being beta).

After a clean installation, the machine would freeze with a blank screen during the startup process. It appeared to go through A/UX loading, but froze when it was building the Macintosh side. After swapping the card and monitor with a regular color monitor and card, things started up fine.

Can you explain?

### DISCUSSION -----

It is not always true that the Display Card 8/24 and a Two-Page Monochrome Monitor work under A/UX 2.0 on a Macintosh IIfx set to 1-bit mode. We tested a Macintosh IIfx, running A/UX 2.0, with a Display Card 8/24 and a Two-Page Monochrome Monitor:

We did a cold start (power-off, then power-on) in 1-bit mode. A/UX 2.0 didn't start up and froze during the startup process. However, if the interrupt button (on the right side of Macintosh IIfx) was pressed, A/UX continued the

startup with no problems.

If the Autolaunch command within the #startup shell was modified to have only the "launch" command (without the -s option, load symbol table in the kernel), A/UX 2.0 started up successfully in 1-bit mode.

The Display Card 8/24 and Two-Page Monochrome Monitor seem to start up A/UX 2.0 fine on other Macintosh II machines, including the Macintosh IIx.

## A/UX: Using dd To Copy Partitions (9/94)

Revised: 9/23/94  
Security: Everyone

A/UX: Using "dd" To Copy Partitions (9/94)

Article Created: 9 October 1990  
Article Reviewed/Updated: 23 September 1994

TOPIC -----

One way of copying A/UX disks is to do a "dd" copy of the various partitions. This is particularly useful on large disks, or when a CD-ROM is not available. However, if you do a "dd" copy, the file system is also copied. This may cause problems on drives that do not like the way Apple has fine-tuned the file system for its files (some drives come with their own parameter files for creating file systems--so that the Generic file is not used).

- 1) Is this true?
- 2) Does it make a difference if you specify "rdsk" or "dsk"?
- 3) Are there better ways to install A/UX on large disks (in particular, allowing larger root&usr partitions), like special versions of tar?

DISCUSSION -----

- 1) Yes, "dd" is often used to do an entire image copy from one hard drive to another of the same size. For instance, to copy an Apple HD80 SC to another Apple HD80 SC, use this command:

```
dd if=/dev/dsk/c0d0s31 of=/dev/dsk/c5d0s31 bs=20k
```

It also can copy file system by file system (with the same size). For example, to copy one A/UX root file system to another, do:

```
dd if=/dev/dsk/c0d0s0 of=/dev/dsk/c5d0s0
```

Since it is an imaging copy from one hard drive to another, everything, including partition map and super block information in the file system, is copied to the destination disk or partition. Therefore, size differences are significant. If you "dd" an entire HD80 SC to an HD160

SC, only 80MB is usable on the HD160 SC.

The two hard drives do not necessarily have to be the same brand. For instance, you can copy from an Apple HD80 SC to a third-party 80MB hard drive, or copy the root file system from an A/UX CD-ROM drive to an Apple HD80 SC A/UX root file system.

- 2) There is no particular difference when specifying "dsk" or "rsk"; they give the same result. However, specifying "rdsk" (raw device I/O) seems to be much faster than "dsk" (block device I/O) because, under raw I/O, there is no block transfer size constraint by the file system logical block size--it can transfer many disk blocks per disk operations.
- 3) If the non-standard procedures section in the "A/UX Installation Guide" documentation does not meet your needs, you can install A/UX on large disks with larger Root&Usr partition than the standard size. For instance:

- Initialize and partition the large disk with the desired Root&Usr size. This can be done using the vendor formatter software or the A/UX "dp" utility.

- Make a new root file system. For example:

```
newfs -s size device-file type
```

- Mount the new root file system on a directory. For example:

```
mount /dev/dsk/c5d0s0 /big
```

- Use "cpio" to copy the standard A/UX Root&Usr file system to a new one. For example:

```
find / -depth -print | cpio -pdlmu /big
```

## DAL: Needs MacDFT 1.1 and MacMainFrame Network Adapter

Revised: 7/27/93  
Security: Everyone

DAL: Needs MacDFT 1.1 and MacMainFrame Network Adapter

=====

Article Created: 31 October 1990  
Article Reviewed/Updated: 26 July 1993

TOPIC -----

I installed DAL (formerly CL/1) for VM/CMS onto an IBM 370. The installation on the host seems okay. I was able to execute the icl1 module on the host. When I tried to connect to the host using a Macintosh, the connection failed. When I tested the connection using cl1 Tester, which comes with the DAL Developer's Toolkit, I got Error -10646. What could have caused this problem?

Here is a list of the hardware and software I used:

- Apple Coax/Twinax cable with MacDFT version 1.0.
- DAL Server for VM/CMS version 1.1
- DAL Developer's Toolkit version 1.1

This is the configuration I used for the host.cl1:

```
vma:3270mac:VMCMS:CUT:A  
vma:login:1:\mRUNNING\slogoff\r\mcontinue\r\mVIRTUAL\svmexit\r:1800:6000:\^x:\M  
login\svm\r\mVIRTUAL\r\muserid\slogon\u\r\mpassword\r\r\w20\n\w20\mReady\n
```

Also, I would like to test the connection with the Avatar MacMainFrame card. I was told that I need the network adapter from DCA (formerly Avatar). What is this network adapter?

DISCUSSION -----

Error -10646 translates to "Cannot Load Network Adapter", the driver associated with the communications board in use. From your description of the problem, the most likely reason for this is that MacDFT 1.1 is required. Update the software, and everything should work as advertised.

The network adapter is DAL driver software, specific to MacMainFrame. It

is available from DCA (formerly Avatar).

As of DAL release 1.2 all DAL releases ship with all the available network adapters. You non longer need to contact the network communications companies for the individual DAL pieces.

Article Change History:

26 July 1993 - Company title changed from Avatar to DCA (Digital Communication Associates).

## APT Routers Support Device Security Across Zones

Revised: 11/1/90  
Security: Everyone

APT Routers Support Device Security Across Zones

=====

This article last reviewed: 9 October 1990

TOPIC -----

How can I get device security across AppleTalk zones?

DISCUSSION -----

APT has announced an update to their AppleTalk routers. They now support device security across zones. Users can hide a LaserWriter, file server, or shared modem from anyone not in their zone.

Users in different zones can be allowed different sets of access to different devices. For example, Zone A may have no access to your LaserWriter but still have access to a file server, while Zone B has access to all LaserWriters but not AppleTalk ImageWriters or NetModems.

APT routers connect multiple LocalTalk, Ethernet, WAN, and Serial networks, and they support AppleTalk Phase 2.

## A/UX : Backup and Restore Functions (3/94)

Revised: 3/11/94  
Security: Everyone

A/UX : Backup and Restore Functions (3/94)

=====

Article Created: 16 October 1990  
Article Reviewed/Updated: 11 March 1994

TOPIC -----

Is special software required to back up A/UX drives? If files are restored, does UNIX need to be notified in any way?

DISCUSSION -----

All versions of A/UX come with software utilities, such as "dump.bsd" and "restore", to back up and/or restore A/UX file systems from a disk drive to a tape backup device. Third-party tape drives can be used if they support the tape driver.

You run the "rdump" and "rrestore" utilities to back up and restore a remote UNIX file system to and from the tape drive. Other utilities, like "cpio", "tar", and "dd", can also be used to back up or restore individual file(s) in different formats.

To create a backup:

```
tar cvbf 16 /dev/rmt/tc<#> <filename>
```

where <#> is the SCSI id number of the tape device and <filename> is the name of the directory or file to backup. Or use:

```
dump.bsd 0ubf 16 /dev/rmt/tc<#> /dev/dsk/c0d0s0
```

where <#> is the SCSI id number of the tape device and an entire filesystem is specified.

Note that the tar command uses a filename specification while the dump.bsd command uses a device name specification.

To check what is on a tar backup, you can get a "table of contents" with

```
tar tvf /dev/floppy0  
or  
tar tvf /dev/rmt/tc#
```

where # is the SCSI id of the tape device.

To extract files from a tar backup:

```
cd <dir where you want files to go>  
tar xvf /dev/rmt/tc#
```

When files are restored, they are automatically restored to the original format, depending on the command option(s) used.

For more information on the backup and restore functions, please refer to manual pages `rdump(1M)`, `dump.BSD(1M)`, `restore(1M)`, `rrestore(1M)`, `tar(1)`, `cpio(1)`, and `dd(1)`.

#### Article Change History:

## A/UX: Optimizing for Current Memory (8/93)

Revised: 8/18/93  
Security: Everyone

A/UX: Optimizing for Current Memory (8/93)

Article Created: 17 October 1990  
Article Reviewed/Updated: 18 August 1993

TOPIC -----

I have an 8MB Macintosh IIcx running A/UX that I want to optimize for performance at that memory configuration. I have read the Tech Info Library article "A/UX: How to Improve File Access Speed", and I have some questions.

If you run a "newconfig" command while under A/UX, will it automatically build a new kernel that is optimized for the current memory in the system? Will "autoconfiguration" at startup time notice that I have more physical memory than the kernel is optimized for and carry out this kconfig command for me?

DISCUSSION -----

Prior to A/UX 3.0 when a "newconfig" command is used to build a new kernel, the file "/newunix" is used as the base for the new kernel. Therefore, the new kernel (/unix) parameter values, like NBUF, NINODE, NFILE, and so on, will be reset to the default from /newunix. To keep the current kernel parameter values when the new kernel is built, use this:

```
# cp /newunix /newunix.orig    #! Save the original newunix
# kconfig -n /unix              #! Modify kernel parameters
# cp /unix /newunix             #! Copy the current kernel to newunix
# newconfig                     #! reconfig the new kernel
```

The new kernel will be built with the current kernel parameters.

If you want to build a new kernel based on the original, the /newunix.orig can be copied back any time. For example, cp /newunix.orig /newunix.

With A/UX 3.0 and higher, the above process is not necessary because the parameter values, like NBUF, NINODE, NFILE, and so on, are kept and become

part of the new kernel.

If there is new hardware (like an EtherTalk NB Card) to be added to the system, A/UX will automatically configure it when A/UX is started up. The file "/newunix" is also used as the base for the new kernel.

Here is a description of booting/launching decision:

When A/UX Startup is launched, by default, it performs:

- AutoRecovery, which checks the root file system with the command:

```
/dev/default
```

If the file system check is successful, do:

- AutoLaunch with the command: launch

The launch command first checks the default kernel against the hardware. Because no kernel is specified on the command line, the contents of file /nextunix, which is /unix, is used by launch. If the kernel matches the hardware, the /unix kernel is used to start up A/UX. If the kernel doesn't match the hardware, the launch command uses the /newunix kernel instead to build the new kernel, and the new kernel is placed on /unix.

## MacX: MacTCP Configuration Problem

Revised: 4/20/93  
Security: Everyone

MacX: MacTCP Configuration Problem

Article Created: 17 October 1990

### Article Change History

-----  
04/20/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I'm having a problem setting up MacTCP (to use MacX). I'm trying to run MacX from the Macintosh OS (as opposed to A/UX). I have an Ethernet connection between my Macintosh IIfx and a RISC UNIX box running X/MOTIF over TCP/IP. The entire Ethernet consists of the UNIX box, two TCP/IP X-stations, and three Macintoshes. There are no routers, gateways, Domain name servers, RARP, or BootP servers on the Ethernet. The Macintoshes can talk to each other via EtherTalk just fine. Also, I can see the UNIX box and X-stations communicate by running EtherPeek on one of the Macintoshes.

I installed the Communications Toolbox, moved the MacTCP Tool (that came with MacX) into the "System Folder:Communications Folder", and moved the MacTCP CDEV files into the System Folder. I also followed the advice in the "MacTCP Setup Tips".

I configured MacTCP (the CDEV) by bringing it up in the Control Panel. I selected:

- Ethernet (as opposed to LocalTalk)
- Address "Manual" (and entered 192.0.0.4)
- No Routing
- No Domain Name information

I restarted. (The AppleTalk connection is set to LocalTalk.)

When launched, MacX displays an alert with the message: "None of the connection

tools are working at the moment--check that they are properly installed and restart MacX. Until this is done, no incoming X-client connections can be accepted."

I tried this with both the MacTCP files that came with MacX and those I got separately from APDA, and had the same results.

#### Specific Questions

- 1) How do I tell MacX what the address of the UNIX box is, or if MacX is really a network "server" on Ethernet, how do I tell it what its name is?
- 2) Is the MacTCP host file needed?
- 3) Does the Communications Toolbox tool MacTCP expect anything special of the MacTCP CDEV?

#### Additional Information

I have a copy of NCSA Telnet (for MacTCP) that will not run on the Macintosh IIX described above. Unfortunately, it doesn't display an error message; it just displays its initial banner and quits after about 5 seconds.

Can you help?

#### DISCUSSION -----

According to the information that you provided, the MacX and MacTCP installation procedure seems to be correct. One thing that should be made more clear is the "MacTCP Tool" must be put in the "System Folder:Communications Folder" folder.

We found that there is a problem using the IP address 192.0.0.4 in the MacTCP configuration, which we think is not a valid class C network number. In a class C network, 192.0.0 is a reserved network number, and it should not be used by any MacTCP configuration. This might be the reason that MacX is displaying the warning message. IP address 192.0.1.4, for instance, can be used as a valid IP number.

Make sure that the network number specified in the MacTCP IP address is valid and is the same network number as the other UNIX machine on the Ethernet.

If MacX and the UNIX box are configured correctly and connected on the network, their IP addresses should be known to each other. Also, on a UNIX box, you can issue the "ping" utility to send an ICMP packet to a MacX server to see if it is up or not. On the MacX server side, you can run the "MacTCP Spy" to see if the MacTCP is up running.

MacX is just a network "display" server, not a network server, in general, like an NFS. If your MacTCP is configured with a Domain name server, all name inquiries can be via the Domain name server. The host file is not necessarily needed. The "MacTCP Tool" does not need a "special" version of the MacTCP CDEV.

## A/UX: File System Limits

Revised: 9/29/92  
Security: Everyone

A/UX: File System Limits

=====

Article Created: 1 November 1990

### Article Change History

-----

10/17/90 - REVIEWED

- For technical accuracy.

### TOPIC -----

What is the limit of the A/UX file system?

### DISCUSSION -----

The total size of an A/UX file system (both UFS and SVFS) is measured in blocks. The number of blocks is stored in each file system's super block with the declaration of "long fs\_size". This value can be stored up to  $2^{32}$  blocks. The block size of the file system in UFS, for instance, can be 512 bytes, 1K, 2K, 4K, or 8K. In SVFS, the default file system block size is 1K.

From the number of blocks and the file system block size, the maximum size of an A/UX file system ranges from  $2^{32}$  Kbytes to  $8 \times 2^{32}$  KB.

## Printers: Difficulties With 9-Part Forms

Revised: 11/1/90  
Security: Everyone

Printers: Difficulties With 9-Part Forms

=====

This article last reviewed: 17 October 1990

TOPIC -----

Can you recommend a third-party printer product that prints a 9-part tractor feed form?

DISCUSSION -----

We were unable to find a printer on the market that prints a 9-part form. The closest we found was one manufactured by Toshiba that prints up to 6-part forms.

The problems encountered with 9-part forms concern the print head. To put enough power behind the pins of a dot matrix to print on the ninth part of the form, the pins will penetrate the first and probably the second part of the form, leaving holes. Also, the pins often get caught in the form as it moves and are bent and the print head needs to be replaced. Unfortunately, printers designed for microcomputer use just aren't up to the task of printing 9-part forms.

Daisy-wheel printers have similar problems. The energy demanded to print through nine layers would break a plastic print wheel and bend metal print wheels out of shape.

Even heavy-duty Printronix line printers are rated only to 6-part forms.

We suggest that you contact the paper company that makes the 9-part forms and ask what printers they recommend for use with these forms.

## AlisaTerminal: Now Supports More Zones

Revised: 11/1/90  
Security: Everyone

AlisaTerminal: Now Supports More Zones

=====

This article last reviewed: 17 October 1990

TOPIC -----

We have had a problem with a WAN. The backbone is connected via cisco routers. They are still mostly at Phase 1. The network worked flawlessly, except for AlisaTerminal. It would look for the DECnet gateway and then hang. After numerous attempts to resolve the problem with Alisa, Alisa agreed that AlisaTerminal had "problems" negotiating with more than 39 zones. (We had a little over 100.)

DISCUSSION -----

Alisa now has an updated AlisaTerminal, available from their Technical Support. We tested the new AlisaTerminal, and it appears to work with 100 zones. The new AlisaTerminal has an added function--you can force additional queries of the network by pressing the Command key and clicking on the Host dialog box.

A/UX 2.0: Restricted Login Problem (9/94)

Article Created: 17 October 1990  
Article Reviewed/Updated: 20 September 1994

TOPIC -----

I want to set up a restricted account through the chroot command. The man pages for login say that you should be able to do this by using a "\*/etc/passwd" in the place of a shell to be executed at startup. I tried to duplicate the problem and documented it below. If this is a bug that is not fixable in the near future, can you suggest a way to set up a restricted account, so that it has no way of getting to /? How is this done on the patch server?

Man page excerpt from login:

If the last field is \*, then a chroot(2) is done to the directory named in the directory field of the entry. At that point, login is re-executed at the new level, which must have its own root structure, including /etc/login and /etc/passwd.

User toad's login sequence, it looks like it is trying to execute "\*".

Apple Computer A/UX (ebc\_A/UX)

```
login: toad
*: No such file or directory
No shell
```

Entry for user toad in /etc/passwd

```
toad::1009:1002:,,,:/users/toad:*
```

Directory structure for users/toad. The files are all linked rather than exact copies. The shared library file was set up in case there was a problem, given the problems I had with anonymous ftp.

```
ebc_aux.root # cd /users/toad
```

```

-rwxr-xr-x  2 root      root        81684 Apr 10 05:48 libc_s
```

#### DISCUSSION -----

This is a bug in the A/UX 2.0 login(1) command. You would not be able to reproduce this by logging in to the console under A/UX 2.0. This feature is a part of the System V login(1) command, which is not executed when logging in to the A/UX console. Instead the /mac/bin/Login program is called, and it does not understand the "\*" syntax in the /etc/passwd file. Even when logging into the serial ports or the console when /mac/bin/Login is not present, the chroot does not work. This is one reason why the patch server is still running A/UX 1.1.1.

You should use rsh(1) as a replacement for the functionality that has been lost in the A/UX 2.0 login command until a fix is provided. rsh would normally be the way to accomplish restricted login anyway.

## MacTCP: Gateway Address; TokenTalk Support

Revised: 11/1/90  
Security: Everyone

MacTCP: Gateway Address; TokenTalk Support

=====

This article last reviewed: 17 October 1990

TOPIC -----

Here are two MacTCP questions:

- 1) What is the "gateway address" box? I know that this is not the address box for a DDP/IP gateway (like a FastPath) for providing server-based addressing. The MacTCP Admin manual mentions that this "gateway address" has something to do with network access when full RIP support is not available.
- 2) I've seen that MacTCP works with "TokenTalk" (not native TCP support for Token Ring). Is this an "officially supported" configuration?

DISCUSSION -----

- 1) The MacTCP Control Panel setting for the "gateway address" does not have any function in relation to the DDP/IP gateway used for TCP/IP encapsulation in AppleTalk. The "gateway address" is used when MacTCP is talking native TCP/IP over Ethernet. If your network does not have a RIP (Route Information Protocol) process running on a router connected to the network, the default gateway address is used to locate routes to "smart" gateways, which might be connected to much larger outside networks, like the Internet. Most BSD UNIX systems are capable of running a RIP process.
- 2) Yes, we support running TCP/IP encapsulated in AppleTalk over Ethernet, Token Ring, or LocalTalk. The physical media does not play a large part in the ability of an encapsulating protocol to function properly.

## TokenTalk Support For Novell Token Ring

Revised: 11/1/90  
Security: Everyone

TokenTalk Support For Novell Token Ring

=====

This article last reviewed: 17 October 1990

TOPIC -----

I understand that there is still no driver available that lets Netware for the Macintosh support Apple's TokenTalk NB Card in Novell's Token Ring environment. Is there a workaround to this problem?

I am running Novell Netware (version 2.15, revision C) on a Token Ring with a PS/2 as server. They have both the compact and modular Macintoshes.

An article mentioned a workaround using an Macintosh IIcx, running as a router between the Macintoshes on TokenTalk and the PS/2 server.

"The router will consist of a TokenTalk NB Card and an EtherTalk Card running to the PS/2 Model 80 running whatever Ethernet card they choose that will work with EtherTalk (that is, 3COM, and so on)."

What I'm not clear about is whether the PS/2 server running Netware automatically supports routing between Ethernet packets and Token Ring packets (on the Novell Token Ring side). Is there additional software required on the PS/2 server?

Will this configuration support transparent file and print services for the Macintoshes as well as electronic mail between the Macintoshes and Novell Token Ring machines?

DISCUSSION -----

Novell has stated that TokenTalk support can be ordered. This will be a new version of VAP (Value-Added Process), which supports AFP (Apple Filing Protocol) 2.0 and TokenTalk.

All Netware operating systems provide an internal router that lets a Netware

server connect to four different networks. No additional software is required. Note that the routing service can also be moved out of the server and into a non-dedicated workstation.

Macintosh, DOS, and OS/2 workstations can share data and resources. Macintosh users should see information stored on the network server as icons. Other workstations on the network (PCs running DOS, OS/2, or Windows 386) should see the folders and file icons from the Macintosh listed as directories and subdirectories in their workstation formats. DOS, OS/2, and Macintosh users can share Apple LaserWriters and other Apple printers. Using an E-mail package that supports Netware Message Handling Service (MHS), the back-end store-and-forward messaging server, you should be able to send E-mail messages and text, data, binary files between different LANs, and wide area networks.

## TokenTalk NB Card: Compatibility of RasterOps Video Card

Revised: 11/1/90  
Security: Everyone

TokenTalk NB Card: Compatibility of RasterOps Video Card

=====

This article last reviewed: 17 October 1990

TOPIC -----

I have been having compatibility problems with RasterOps video cards and Apple's TokenTalk NB Card.

DISCUSSION -----

RasterOps identified and corrected some problems with their 224/724 cards. The problems occurred on Macintoshes with a 224/724 card and TokenTalk NB Card.

- 1) No video on the 224/724 card at powerup.
- 2) Selecting 24 bits/pixel on the 224/724 card causes pixels to change color under the cursor (and at random on the startup screen).
- 3) Zones and servers appear and disappear.
- 4) In all of the above cases, eventually a bus error (ID=1, sometimes ID=28) system bomb occurs.

The fixes are hardware rework. All finished goods and cards shipped since early May 1990 should contain this fix. Customers with problems should contact the RasterOps Technical Support department.

Security: Everyone

A/UX: Autoconfig Cannot Find Drivers Error

=====

Article Created: 11 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I got the error: "Warning cannot find driver(s) for device ID XX Version X.X".

### DISCUSSION -----

For any slot card that Autoconfig cannot find a module in the kernel with a matching board and version number, Autoconfig prints a warning message to the system console.

For example, if autoconfig cannot find the driver for an Ethernet card you have installed, it prints a message similar to the following:

```
Warning cannot find driver(s) for device ID 5 Version 7.0
```

It is just an informational warning and does not signify any real error.

If the card is a monitor card, then the error is irrelevant, since the card will work with the default monitor kernel driver.

Article Created: 11 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

What does the text in /etc/startup mean?

### DISCUSSION -----

Each line in the file /etc/startup lists the startup program to be executed at system boot time and the arguments to be passed.

The options are as follows:

"-M" followed by a number specifies the major device number.

"-C" followed by a number specifies the number of controllers associated with this module in the system.

"-D" followed by a number specifies the number of devices per controller.

"-S" specifies the NuBus slot in which the controller exists.

For example, the line:

```
/etc/startup/TEST -M 9 -C 1 -D 1 -S 11
```

within the /etc/startup file indicates that the TEST module has a major device number of 9, has one slot associated with it in the system, has one device per slot card, and is installed in slot 11.

## A/UX: How to Create an NFS Kernel (9/94)

Revised: 9/6/94  
Security: Everyone

A/UX: How to Create an NFS Kernel (9/94)

=====

Article Created: 12 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

How do you create an NFS kernel?

DISCUSSION -----

For A/UX 3.0, to make a kernel that supports NFS, open the Command Shell window and enter this command:

```
newconfig nfs
```

If this is the first time that the Ethernet driver has been included in a kernel on this computer, newconfig displays the prompts that allow you to define the TCP/IP connection for this machine. Regardless of whether the computer has already been configured to connect to a TCP/IP network, the newconfig command also prompts you for information about NIS.

In addition to making a new kernel, the newconfig command enables nfsd, biod, mount, rpc.statd, and rpc.lockd in the /etc/inittab file. Enabling nfsd is required for the computer to be an NFS client.

When newconfig is done, increase the number of kernel memory buffers by running the kconfig command:

```
kconfig /unix
```

```
NMBUFS=1000
```

```
(CONTROL-D)
```

If the computer has 8 MB or less of physical memory, you should also increase the value of MAXCORE by entering this command while running kconfig:

MAXCORE=0x60000

If the computer has more than 8 MB of physical memory, the memory allocation routines in the kernel dynamically adjust the value of MAXCORE. The new values for MAXCORE and NMBUFS cause the allocation of more of the kernel memory buffers that NFS uses, which improves server performance.

Choose Restart from the Finder's Special menu. When A/UX is up, the computer should be an NFS file server.

To verify, log in and run ps to see that the appropriate number of nfsd processes are running. You can determine that number by checking the nfsd entry in the /etc/inittab file. The default number is 4.

If the nfsd processes are not running, check the nfsd entry in /etc/inittab and restart your computer again. Next, verify that the pathnames specified in /etc/exports can be mounted. To do so, enter this command:

```
showmount -e
```

This is an example of the response, assuming that the entry is /etc/exports on hostname1 is

```
/usr/catman -access=hostname2
```

The response would be

```
export list for hostname1:  
/usr/catman -access=hostname2
```

Finally, check /etc/inittab to verify that the entries in your file match the entries shown here:

```
nfs3:2:wait:/etc/nfsd 4          # set to "wait" for NFS server  
nfs4:2:wait:/etc/biod 4          # set to "wait" for NFS client  
nfs5:2:wait:/etc/rpc.statd      # set to "wait" for NFS status monitor  
nfs6:2:once:/etc/rpc.lockd      # set to "once" for NFS lock manager  
nfs8:2:once:/etc/mount -at nfs > /dev/syscon 2>&1 # set to "once" for NFS
```

For additional information, refer to the A/UX Network System Administration manual.

## A/UX: How to Build a Kernel Without Networking

Revised: 8/16/93  
Security: Everyone

A/UX: How to Build a Kernel Without Networking

Article Created: 12 October 1990  
Article Reviewed/Updated: 31 August 1992

TOPIC -----

How do you build a kernel without networking?

DISCUSSION -----

To build a kernel using the Autoconfig command:

- 1) Log on to the system as "root".
- 2) Enter the command: /etc/newunix nonet
- 3) Enter the command: autoconfig

The output of the Autoconfig command might look similar to this:

Warning cannot find driver(s) for device ID 5 Version 7.0 Ignore the message: 'ld warning: file /tmp/kernAAAA02712 has no relocation info' if it appears. ld warning: file /tmp/kernAAAA02712 has no relocation information

|    | Module  | Board | Prefix | Major | Flags                             |
|----|---------|-------|--------|-------|-----------------------------------|
|    | =====   | ===== | =====  | ===== | =====                             |
| 0: | scc     |       |        | 0     | init-??? present char             |
| 1: | scsi    |       |        | 24    | init-??? present block            |
| 2: | tty     |       |        |       | init-??? present                  |
| 3: | streams |       |        |       | init-??? present                  |
| 4: | slots   |       | slots  |       | init-normal included lib          |
| 5: | toolbox |       | ui_    | 4     | init-normal included char fork ex |

The last few lines of information sorted by columns describe the modules currently included in the kernel. You should not see any lines in the output that contain "nfs", "bnet", or "ae6".

Note: To make use of the new kernel, you must reboot the system.

A/UX: Configuring the Kernel for an NFS Server (9/94)

=====

Article Created: 12 October 1990  
Article Reviewed/Updated: 1 September 1994

TOPIC -----

How do I install NFS (configure the kernel) for an NFS server?

DISCUSSION -----

If you are using A/UX 2.0 or 3.0, bring the system to single-user mode and type the command:

```
newconfig nfs
```

Then, follow the steps below:

- 1) Edit /etc/exports to specify hosts eligible to mount file systems from this server. In this file, you will specify what partitions you will allow to be mounted and what systems may be mounted.

For example: to let anyone on the system "hostname1" mount a file partition named "/u1", you would enter the line to /etc/exports:

```
/u1 hostname1
```

- 2) Check that a file system has been exported to this system; enter the command-line: `showmount -e`

The output should look similar to the following:

```
/ hostname1  
/users hostname1 hostname2
```

## A/UX: How to Mount a Remote NFS System Manually (9/94)

Revised: 9/22/94  
Security: Everyone

A/UX: How to Mount a Remote NFS System Manually (9/94)

=====

Article Created: 12 October 1990  
Article Reviewed/Updated: 22 September 1994

TOPIC -----

How do I manually mount a remote NFS file system?

DISCUSSION -----

The following steps use fictional directory and system names to give an example of how to manually mount a remote file system.

- 1) Log on the system as "root".
- 2) You will need a directory on which you will mount the remote file partition. Let's call the directory "mntdir".
- 3) Enter the line: `mkdir /mntdir`

This creates the directory mntdir in "/".

- 4) Next, we need the name of the remote file partition. We'll use the `/usr/catman` directory on the remote system "my\_system\_name" as an example.
- 5) Enter the line: `mount my_system_name:/usr/catman /mntdir`

This command line mounts the `/usr/catman` from the system "my\_system\_name" onto the `/mntdir` on the local system.

- 6) To check that the partition is actually mounted, type the command "mount" and press Return. Among the output, you should find one line for the remote partition just mounted:

`my_system_name:/usr/catman on /mntdir`

A/UX: How to Mount a Remote NFS System Automatically (9/94)

=====

Article Created: 12 October 1992  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

How do I make a remote NFS file system mount automatically at startup?

DISCUSSION -----

- 1) Log on the system as "root".
- 2) First, remember that you will need a directory on which you will mount the remote file partition. Let's call the directory "mntdir".
- 3) Create the directory mntdir in "/"; enter the command-line:  
mkdir /mntdir
- 4) You need the name of the remote file partition. Use the  
/usr/catman directory on the remote system "my\_system\_name" as an example.
- 5) Edit the file /etc/fstab. This file contains a list of file partitions that will automatically be mounted at boot time.
- 6) Add the line: my\_system\_name:/usr/catman /mntdir nfs rw,soft 0 0
- 7) Save the file and exit the editor.
- 8) Shut the system down.
- 9) Bring the system back up into multi-user mode.
- 10) The names of the local and remote partitions will be listed as they are automatically mounted.

A/UX: Daemons Needed for NFS (9/94)

Article Created: 12 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

What daemons need to be running for NFS?

DISCUSSION -----

By using the "ps" command, you can determine if all the NFS daemons necessary for an NFS server are running.

- 1) Log on to the system as "root".
- 2) Enter the line: ps -ef
- 3) If all the necessary daemons are running, you should find these lines within the output:

|      |     |     |   |           |      |              |
|------|-----|-----|---|-----------|------|--------------|
| root | 98  | 1   | 0 | 09:42:27? | 0:00 | /etc/portmap |
| root | 100 | 100 | 0 | 09:42:28? | 0:00 | /etc/nfsd 4  |
| root | 102 | 100 | 0 | 09:42:29? | 0:00 | /etc/nfsd 4  |
| root | 103 | 100 | 0 | 09:42:29? | 0:00 | /etc/nfsd 4  |
| root | 104 | 100 | 0 | 09:42:29? | 0:00 | /etc/nfsd 4  |
| root | 116 | 1   | 0 | 09:42:37? | 0:00 | /etc/inetd   |

The above lines may not appear together, and the numbers in the columns may differ on your system.

If you don't have the nfsd 4 lines appear, you may try the following procedure to start the /etc/biod daemon.

- 1) Log on as "root".

2) Edit the file /etc/inittab

3) Enter these changes:

- Change this line: nfs4:2:off:/etc/biod 4

- To this line: nfs4:2:wait:/etc/biod 4

- Change this line: nfs8:2:off:/etc/mount -at nfs > /dev/syscon 2>&1

- To this line: nfs8:2:once:/etc/mount -at nfs > /dev/syscon 2>&1

4) Now, when your system is booted into multi-user mode, the daemon will automatically be started.

A/UX: How to Use showmount

=====

Article Created: 12 October 1990  
Article Last Reviewed: 31 August 1992  
Article Last Updated : 31 August 1992

TOPIC -----

How do I use showmount?

DISCUSSION -----

The "showmount" command lists remotely mounted or exported file systems. The showmount command executed with no options lists the systems which have file systems remotely mounted from your system. Here is some example output from "showmount":

```
my_system_name
grumpy
```

This output tells us that the systems "my\_system\_name" and "grumpy" have partitions mounted from your system.

The showmount command has three options:

"-d" This option displays a list of the directories being remotely mounted from your system.

"-e" Prints a list of exported file systems.

"-a" Displays a list of hosts/remotely mounted directories sorted by hostname.

By using the "-a" option with the /usr/etc/showmount command, you can get a list of directories remotely-mounted from your system, sorted by the hostnames on which they are mounted.

Example output from the command line "showmount -a":

```
machen: /  
machen: /users  
redpony: /usr  
redpony: /usr/catman
```

This example shows that the system "machen" has the "/" and "/users" partition mounted on his system while the system "redpony" has "/usr" and "/usr/catman" remotely mounted.

## A/UX: nfsstat Defined (9/94)

Revised: 9/7/94  
Security: Everyone

A/UX: nfsstat Defined (9/94)

Article Created: 12 October 1990  
Article Last Reviewed: 6 September 1994

TOPIC -----

What's nfsstat?

DISCUSSION -----

The nfsstat command displays or initializes information about the Network File System (NFS) and Remote Procedure Call (RPC) interface to the kernel.

The nfsstat command executed without any options will give you a complete output of NFS, RPC, server and client statistical information.

For more information, see the manual page for nfsstat or the A/UX Network System Administration manual chapter on Configuring and Managing the Network File System.

Here is example output displayed from the command line "nfsstat":

Server rpc:

| calls | badcalls | nullrecv | badlen | xdrCALL |
|-------|----------|----------|--------|---------|
| 27018 | 0        | 0        | 0      | 0       |

Server nfs:

| calls   | badcalls |         |        |           |          |         |  |
|---------|----------|---------|--------|-----------|----------|---------|--|
| 27018   | 0        |         |        |           |          |         |  |
| null    | getattr  | setattr | root   | lookup    | readlink | read    |  |

## A/UX 3.0: How to Set tty to Work With cu (8/94)

Revised: 8/23/94  
Security: Everyone

A/UX 3.0: How to Set tty to Work With cu (8/94)

Article Created: 12 October 1990  
Article Reviewed/Updated: 22 August 1994

TOPIC -----

What tty do I use with cu?

DISCUSSION -----

The Macintosh has two serial ports called tty0 and tty1. The cu command is used to dial out and requires complete control of the serial port you tell it to use. That means that the getty process, which runs on serial ports waiting for users to dial in, must not be active on a serial port that is being used for dial-out purposes.

To set up the serial port so that it can be used for either dial-in or dial-out purposes, modify the /etc/inittab file so that the value of the action field of the serial port is respawn. Here is an entry for tty0:

```
00:2:respawn:/etc/getty tty0 mo_2400    # Port 0 (modem)
```

When you are finished editing /etc/inittab, run init q to stop any getty process that may currently be running on the port.

The cu command uses the /usr/lib/uucp/Devices file to get the information it needs about the device to use when establishing the connection. Here is an entry in the Devices file for a Hayes 2400 baud modem attached to tty0:

```
ACU      tty0 - 2400 hayes
```

Here is an example of a minimal cu command line that specifies a telephone number:

```
cu 4155551212
```

When a telephone number appears on the cu command line, cu searches the Devices

file for an entry that begins with ACU. Since we set up the Devices file with a line that starts with ACU, it will attempt to dial through serial port 0 (modem) at 2400 baud.

NOTE: The A/UX Network System Administration manual chapter on "Setting Up the UUCP System" contains complete descriptions of the procedures outlined above.

22 Aug 1994 - Updated for A/UX 3.0 and /usr/lib/uucp/Devices file.

## A/UX: How To take and put With cu (6/93)

Revised: 8/12/93  
Security: Everyone

A/UX: How To take and put With cu (6/93)

=====

Article Created: 7 September 1989  
Article Reviewed/Updated: 23 June 1993

TOPIC -----

How do I take and put files with cu?

DISCUSSION -----

Use the ~%take and ~%put commands.

Once you have made a successful connection with cu from local\_machine to remote\_machine, you may take & put files with the following commands:

~%take filename

This command takes the file filename from remote\_machine and puts it in the current directory on local\_machine. The command:

~%put filename

puts the file filename from local\_machine to the current directory on remote\_machine.

If you do not want the file filename to be put in the current directory, specify an absolute pathname (although this is not recommended).

A/UX: How to Login via a Serial Port (9/94)

Article Created: 12 October 1990  
Article Reviewed/Updated: 23 September 1994

TOPIC -----

How do I login via a serial port?

DISCUSSION -----

- 1) With the power to the system off, connect a straight-through serial cable from your A/UX system to the terminal or system that will be acting as a terminal.
- 2) Boot A/UX to multi-user mode. To put the system into multi-user mode, you can either type "init 2" at the command line or edit the file /etc/inittab to change default run level from "s" (single user mode) to "2" (multi-user mode).
- 3) Start a getty on the port used for login. Do this by editing one of the bottom two lines in /etc/inittab. One line changes the settings for the modem port, while the other one changes the settings for the printer port. The default entry for the modem port reads:

```
00:2:off:/etc/getty tty0 at_9600 # Port 0 (modem); set to 'respawn'
```

Change the word "off" to "respawn", so that it looks like:

```
00:2:respawn:/etc/getty tty0 at_9600 # Port 0 (modem); set to 'respawn'
```

## A/UX: How to Do Remote Printing (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: How to Do Remote Printing (9/94)

=====

Article Created: 12 October 1990  
Article Reviewed/Updated: 8 September 1994

TOPIC -----

How can I do remote printing?

DISCUSSION -----

On A/UX 2.0

You can run remsh, using cat in the local system and lp through the remote shell on the system where the printer is connected. Here is an example in which "mysys" is the host name:

```
cat file1 | remsh mysys lp
```

On A/UX 3.0

The operating system recognizes remote printer indications in the file /etc/printcap. /etc/printcap contains configuration information used by the lpr print spooler. If you plan to connect a printer directly to a remote computer on the network, a user on the local Macintosh can print on that printer by using the -P remotehost option to lpr if the /etc/printcap file on the Macintosh is set up. Edit the file /etc/printcap and find these lines:

```
# Remote UNIX line printer
```

```
# Change 'RemoteHost' to actual name of the remote UNIX host
```

```
remote|remote line printer:\
```

```
:lp=:rp=lp:rm=RemoteHost:sd=/usr/spool/lpd/Remote:
```

Change RemoteHost to the host name of the computer to which the printer is

directly connected.

## A/UX: The /etc/exports File

Revised: 9/14/92  
Security: Everyone

A/UX: The /etc/exports File

=====

Article Created: 15 October 1990

Article Change History

-----  
08/31/92 - REVIEWED  
•For technical accuracy

TOPIC -----

What's the file /etc/exports used for? What is its format?

DISCUSSION -----

NFS file servers use the /etc/exports file to control which file systems can be mounted by which systems on the network. Entries in /etc/exports specify a file system name that can be remotely mounted. The file system name is left justified and may be followed by a list of hostnames or netgroup names separated by spaces or tab characters.

If a hostname or netgroup name follows the file system name, export permissions are limited to the host(s) or netgroup(s) specified. Otherwise, it is open to everyone.

A number sign (#) anywhere on a line begins a comment that remains in effect to the end of the line.

An example /etc/exports file could look like:

```
/
/usr/catman my_system_name
```

In this example, the "/" partition is exported to any system on the network. The "/usr/catman" partition, however, is only exported to the system named "my\_system\_name".

A/UX: How to Determine Which Partitions Are Being Exported

=====

Article Created: 19 November 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

How do I find out which partitions are being exported from another system on the network?

### DISCUSSION -----

By using the "-e" options with the /usr/etc/showmount command and specifying a hostname, you can get a list of the partitions that are being exported from another system on the network.

For example, to get a list of exported directories from the system "macaux," enter the line:

```
showmount -e macaux
```

The output could look like this:

```
export list for macaux:
/s1      everyone
/        everyone
```

This output tells us that the "/" and "/s1" directories from the system "macaux" are being exported to everyone.

A/UX: How to Print a List of Exported File Systems

=====

Article Created: 15 October 1990  
Article Last Reviewed: 31 August 1992  
Article Last Updated : 31 August 1992

TOPIC -----

How do I print a list of exported file systems?

DISCUSSION -----

By using the "-e" option with the /usr/etc/showmount command, you can quickly list the directories you have exported to other systems on the network.

Example output from the command line "showmount -e" executed the command line from the system "my\_system\_name":

```
export list for my_system_name:
/users      machen redpony
/           machen redpony
```

This example says that the directories "/" and "/users" are exported to the systems "machén" and "redpony" only.

In A/UX 3.0, /etc/exportfs can be used. With no options, all exported file systems are listed.

A/UX: NFS Configuration (9/94)

=====

Article Created: 15 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

What files are modified when configuring a system to be an NFS server?

DISCUSSION -----

The following files are modified in some way when installing NFS:

- /etc/inittab
- /unix
- /etc/fstab
- /etc exports

The /etc/inittab file must be modified to start the BNET and NFS daemons.

The kernel, /unix, must be recreated to include the NFS modules.

The /etc/fstab file is a list of the local and remote partitions which are to be mounted automatically at boot time.

The file /etc/exports contains a list of the file partition which the server system will allow to be remotely mounted by other systems on the network.

## A/UX: The nobody Login Account (9/94)

Revised: 9/6/94  
Security: Everyone

A/UX: The "nobody" Login Account (9/94)

Article Created: 15 October 1990  
Article Last Reviewed: 6 September 1994

TOPIC -----

How do I modify /etc/passwd for NFS? What's the "nobody" login account for?

DISCUSSION -----

The /etc/passwd file must contain a login account for "nobody".

Enter the line: `grep nobody /etc/passwd`

The response should be:

```
nobody:*:65534:65534::/:
```

If this line does not appear, modify the /etc/passwd file to include it. This account is used by NFS to disallow root access via NFS.

For system security reasons, the super-user does not have access permissions on remote file systems. This is implemented by mapping UID 0 ("root") to UID 65534 (unsigned representation of -2 in 2's complement notation) on all NFS client systems. The super-user on an NFS client has the same permissions as a user with the UID -2.

The login account "nobody" has the UID 65534 (-2).

## A/UX: Fields in /etc/fstab (9/94)

Revised: 9/22/94  
Security: Everyone

A/UX: Fields in /etc/fstab (9/94)

Article Created: 20 November 1990  
Article Reviewed/Updated: 22 September 1994

TOPIC -----

What are the fields in the file /etc/fstab?

DISCUSSION -----

The file /etc/fstab consists of a number of lines like:

```
/dev/dsk/c0d0s0      /          5.2 rw      1 1
hostname1:/usr/catman /usr/catman nfs ro,soft 2 2
```

Fields are separated by blanks or tabs. A number sign (#), as the first non-space character, begins a comment.

The first field in each line specifies the device on which the local partition to be mounted exists. For a remote file partition, it contains the hostname of the system on which the remotely-mounted file system really exists, and then a colon (:), followed by the absolute path name of the file partition as it exists on the server system.

The second field is the local mount-point. For a local system file partition, the device pathname is specified. For a remote file partition, you should see the remote host's name and the full pathname of the file partition to be mounted.

The third field is the type of file system. This may be 4.2, 5.2, nfs, or ignore. If this field is ignore, the entire line is ignored. This feature lets you keep remote mounts that you do not want to mount routinely in /etc/fstab when you boot the system.

The fourth field contains options that are passed to the mount command. Some of the valid options include:

- "rw" specifying that the mounted file system is readable and writable.
- "ro" specifying that the mounted file sytem is read-only.
- "soft" If a file system is mounted read-only, this option lets the client system keep running using only local data, when the server system goes down.

The fifth field is a dump-level parameter used by the dumpfs command.

The last field is the fsck pass number; this number indicates in what order the partition will be checked by fsck. Partitions on different physical drives may be checked at the same time. This field value is not used on remote file systems.

## A/UX: Solution to RPC\_PROG\_NOT\_REGISTERD Error

Revised: 9/28/92  
Security: Everyone

A/UX: Solution to "RPC\_PROG\_NOT\_REGISTERD" Error

=====

Article Created: 15 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I tried to mount a remote file system and got the error:

```
mount: <hostname> server not responding: RPC_PROG_NOT_REGISTERD
```

### DISCUSSION -----

Check to see that the /etc/initd daemon is running.

1) Log on to the system as "root".

2) Enter the line:

```
ps -ef | grep mount
```

The output should look like this:

```
root  317   107   0  Apr 25 ?      0:05 rpc.mountd
```

If you did not get this output, do these steps:

1) Enter the line:

```
grep inetd /etc/inittab
```

You should see this output:

```
net9:2:respawn:/etc/inetd
```

The inetd daemon starts the rpc.mountd daemon. If the output does not match the above output, edit the file /etc/inittab and change that line so that it does.

2) Shut the system down into single-user mode;

```
# sync; sync
# init 1.
```

3) Bring the system back up into multi-user mode

```
# init 2
```

## A/UX: Solution to mount: not in export list for <host> Error

Revised: 11/20/90  
Security: Everyone

A/UX: Solution to "mount: not in export list for <host>" Error

=====

This article last reviewed: 15 October 1990

TOPIC -----

I tried to mount a file system and got the error:

```
mount: not in export list for <host>
```

DISCUSSION -----

Enter the line:

```
showmount -e
```

followed by a space and the name of the of the host from which the file system you are mounting exists.

The output displayed lists all the file systems that the remote host has exported and to which systems it has exported them.

Here is example output from the command line, "showmount -e macaux":

```
export list for macaux
/cmd/src    everyone
/s1         my_system_name sleepy grumpy
```

In this example, "my\_system\_name", "sleepy", and "grumpy" systems have permission to mount the file system "/s1". No other system has permission. However, "/cmd/src" can be mounted remotely by any system on the network.

If the name of your system is not included in the export list for a particular file system, you cannot mount that file partition. Consult with the system administrator of that host to have your system added to the export list.

Here is another example output from the command line, "showmount -e macaux":

```
export list for macaux
/cmd/src      everyone
/s1           my_system_name sleepy mispeled
```

In this example, "my\_system\_name", "sleepy", and "mispeled" systems have permission to mount the file system "/s1". No other system has permission. However, "/cmd/src" can be mounted remotely by any system on the network.

The system "misspelled" is not spelled correctly in the export file, so that system cannot mount that partition. Consult with the system administrator of that host to have your system correctly spelled in the export list.

A/UX: Solution to "network unreachable" Error

=====

This article last reviewed: 15 October 1990

TOPIC -----

I tried to mount a remote file system and got the error:

network unreachable

DISCUSSION -----

This could be because the Ethernet card or cable connection is not working correctly. Here are four trouble-shooting steps:

- 1) Make sure that the Ethernet cable from the Ethernet card to the rest of the network is connected and seated properly and snugly.
- 2) Check that there is not a broken connection in the main network cable itself.
- 3) Check that cables do not show any physical signs of damage. Ethernet cables should not be crimped, bent, or squished.
- 4) Replaced all cables that show excessive wear.

## A/UX: NFS server <hostname> not responding... Error (9/94)

Revised: 9/7/94  
Security: Everyone

A/UX: "NFS server <hostname> not responding..." Error (9/94)

=====

Article Created: 15 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

I tried to mount a file system and got the error:

NFS server <hostname> not responding, still trying

DISCUSSION -----

Check to see that the remote system (the one with the file system you're trying to mount) is available.

Enter the line:

ruptime

Here is an example of the kind of output you might see:

|        |      |          |
|--------|------|----------|
| grumpy | down | 0:11     |
| sleepy | up   | 36+00:41 |
| snow   | up   | 21:54    |

The system "grumpy" is down. Because the host is down, the NFS file systems aren't available and won't be available until the host comes back online.

A/UX: How to Make an NFS Daemon Run (9/94)

=====

Article Created: 15 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

My NFS daemon isn't running. Why not?

DISCUSSION -----

Was the nfs daemon started in /etc/inittab? If not, follow these steps:

1) Log on as "root".

2) Edit the file /etc/inittab

3) Change the line

```
nfs3:2:off:/etc/nfsd 4      # set to "wait" for NFS server
```

to:

```
nfs3:2:wait:/etc/nfsd 4     # set to "wait" for NFS server
```

4) Enter the line: telinit q

5) Enter the line: ps -ef | grep nfsd (or, ps-a | grep nfsd in the C shell)

The output should resemble the following:

```
root  93 1  0 10:00:34?    0:00 /etc/nfsd 4
root  94 1  0 10:00:35?    0:00 /etc/nfsd 4
root  95 1  0 10:00:35?    0:00 /etc/nfsd 4
root  96 1  0 10:00:35?    0:00 /etc/nfsd 4
```

Note that the numbers in the columns may differ on your system.

## A/UX: NFS Defined (9/94)

Revised: 9/7/94  
Security: Everyone

A/UX: NFS Defined (9/94)

=====

Article Created: 15 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

What is NFS?

DISCUSSION -----

NFS is the abbreviation for "Network File System".

NFS lets UNIX systems, connected by an Ethernet network, share file systems or partitions remotely (that is, over the network); it lets one UNIX system on the network share and access the disk space of another system on the network. This helps conserve disk space and allows the sharing of resources. For example, printers, or the on-line manual pages are often placed on an NFS volume for global access by everyone on the network.

An NFS client (the remote system) may mount a file partition of the NFS server (the system on which the actual disk space for the partition exists). This is all transparent to the user. The user can access the remote file system as though it were a local disk.

## A/UX: Solution to /etc/fstab: No such file or directory Error

Revised: 11/20/90  
Security: Everyone

A/UX: Solution to "/etc/fstab: No such file or directory" Error

=====

This article last reviewed: 15 October 1990

TOPIC -----

I tried to mount a file system and got the error:

`/etc/fstab: No such file or directory`

DISCUSSION -----

The name of the file system that you are trying to mount does not exist in the file /etc/fstab.

- 1) Log onto the system as "root".
- 2) Edit the file /etc/fstab.
- 3) Add an entry for the file system that you are mounting.

## A/UX: Solution to mount: <file system> already mounted Error

Revised: 11/20/90  
Security: Everyone

A/UX: Solution to "mount: <file system> already mounted" Error

=====

This article last reviewed: 15 October 1990

TOPIC -----

I tried to mount a file system and got the error:

```
mount: <file system> already mounted
```

DISCUSSION -----

Follow these steps:

- 1) Log onto the system as "root".
- 2) Enter the line: mount

A list of the currently mounted file systems will be displayed.

Example output:

```
/dev/dsk/c0d0s0 on / type 5.2 (rw,noquota)
/dev/dsk/c0d5s0 on /users type 5.2 (rw)
macaux:/s1 on /earlwl type nfs (rw,soft)
```

If the file system you trying to mount is listed, then it is already mounted. You may unmount the file system and mount it again to be sure.

- 1) Enter the command

```
umount
```

followed by a space and the absolute pathname of the file system directory. For example, the command "umount /users" unmounts the /user partition.

2) Enter the command

```
mount
```

followed by a space and the device name of the file system to be mounted, a space, and the absolute pathname of the directory on which the file system will be mounted. For example, the command

```
mount /dev/dsk/c5d0s0 /users
```

mounts the file system associated with the device "/dev/dsk/c5d0s0" on the directory /users.

## LaserWriter IINTX: Dual Connection to Macintosh and PC (2/95)

Revised: 2/23/95  
Security: Everyone

LaserWriter IINTX: Dual Connection to Macintosh and PC (2/95)

=====

Article Created: 10 October 1990  
Article Reviewed/Updated: 22 February 1995

TOPIC -----

Is it possible to connect a LaserWriter IINTX (with rev 2.0 ROMs) to a Macintosh, through an AppleTalk connection AND to an IBM PC, through a serial connection?

I want to have both cables connected at the same time and select the appropriate port to print from. How do I change from HP LaserJet mode to PostScript mode without changing the DIP switches?

And can I simultaneously have a serial connection and an AppleTalk connection with a LaserWriter IINTX?

DISCUSSION -----

The LaserWriter IINTX will not support simultaneous serial and LocalTalk connections. We recommend that if you are switching between both kinds connections you should disconnect the cable you're not using.

However, it is possible to connect a LaserWriter to an AppleTalk network and to an IBM PC, using software switching to change between the two.

- You must have the LaserWriter IINTX ROM upgrade to switch both ways.
- The following instructions assume that there is a LocalTalk connection to the LaserWriter through the RS-422 port, a serial connection to the IBM PC through the RS-232 port, and all DIP switches are up (default AppleTalk PostScript).
- Remember that the LaserWriter will need some time to respond to the procedures outlined below. Its Ready light flashes while the LaserWriter is setting each of these parameters. Wait for this light to stop flashing before you send another command, or the LaserWriter may not receive all of the next command.

Caution:

-----

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

To Switch From an AppleTalk Connection To a Serial Connection

=====

Step 1:

-----

To disable the RS-422 port, set its baud rate to 0. Send this PostScript file to the LaserWriter:

```
%=====
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
9 0 0 setsccbatch
9 0 0 setsccinteractive
<Control-D> %(if in interactive mode)
%
% end PostScript Code
%=====
```

This prevents the printer from sending serial information over the AppleTalk network, causing unpredictable results.

Step 2

-----

To set the LaserWriter to work in LaserJet Plus mode through the serial (RS-232) port, send this PostScript file to the LaserWriter:

```
%=====
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
5 setsoftwareiomode
0 sethardwareiomode
<Control-D> %(if in interactive mode)
%
% end PostScript Code
%=====
```

The LaserWriter now uses the RS-232 port, as if it were a LaserJet Plus. The LaserWriter no longer understands PostScript, is not available over the network, and does not appear in the Chooser.

But the IBM PC can now talk to the LaserWriter. To confirm this, type this command at the DOS prompt:

```
MODE COM1:96,n,8,1,p
```

This tells the IBM PC to send information at 9600 baud, the default for the LaserWriter through the serial port. You can now print as though you were connected to a LaserJet Plus.

To Return To a PostScript LaserWriter Over an AppleTalk Network

=====

Step 1

-----

Send a file containing the characters Escape, Delete, 0, and Control-D. The best way to do this is to use BASIC to explicitly put these characters in a file.

For example, use this BASIC program:

```
open "psreturn.txt" for output as #1
print #1,chr$(27);chr$(127);"0";chr$(4)
close #1
```

and send this file to the LaserWriter using this command from the DOS prompt:

```
TYPE PSRETURN.TXT > COM1
```

whenever you want to switch to a PostScript LaserWriter.

The LaserWriter is now in PostScript mode and using serial communication. You can send PostScript programs from the IBM PC through the RS-232 port, and the LaserWriter will respond.

To Switch Back to AppleTalk Communication Through the RS-422 Port

=====

Step 1

-----

At the DOS prompt, create this PostScript program:

```
COPY CON SET.MOD
%=====
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
0 setsoftwareiomode
2 sethardwareiomode
<control-Z>
%
% end PostScript Code
%=====
```

Step 2

-----

Send the program to the LaserWriter with the DOS command:

```
TYPE SET.MOD > COM1
```

(this will take some time).

The LaserWriter is now back in AppleTalk PostScript mode, using the RS-422 port.

### Step 3

-----

Set the baud rate of the RS-422 port back to what it was. This can be done from your Macintosh using this PostScript program:

```
%=====
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
  9 9600 0 setsccbatch
  9 9600 0 setsccinteractive
%
% end PostScript Code
%=====
```

This assumes that you want to set the baud rate to 9600. Change this number if you want another rate.

This is not the LocalTalk baud rate; it is the baud rate that would be used if you connected serially to the RS-422 port. You are not required to set this number back to what it was to work over LocalTalk, but it is the default number set in the printer.

The LaserWriter's settings should now be what they were when you started.

## MacTerminal 3.0: How To Send Break

Revised: 11/29/90  
Security: Everyone

MacTerminal 3.0: How To Send "Break"

=====

This article last reviewed: 12 November 1990

TOPIC -----

A customer wants multisession support from MacTerminal 3.0 running on a Macintosh connected to a DEC terminal server. He needs to be connected to the LocalTalk network to print during sessions.

His terminals let him use a "break" key to switch between different sessions that the terminal server is maintaining for the particular terminal.

He wants to be able to watch three sessions at the same time in different windows on a two-page display.

What is the ASCII code to put a DEC terminal server into a new session?

DISCUSSION -----

There is no ASCII code for the BREAK signal. The data line can be in two conditions:

- MARK (negative voltage, binary 1), or
- SPACE (positive voltage, binary 0).

The data line is normally in MARK condition; it is in the SPACE condition only while a frame is being transmitted. A longer-than-normal SPACE condition, around 100 to 600 milliseconds, is used as a special signal known as a BREAK.

The "Send Break" command in MacTerminal 3.0 sends a long break (3.5 seconds) across the open connection, which has the same effect as choosing the corresponding Break key from the keyboard. The "Send Break" command in MacTerminal 3.0 is under the Sessions menu; its keyboard equivalent is Command-Y.

## A/UX: How Users Can Shut Down Without Root Access (9/94)

Revised: 9/23/94  
Security: Everyone

A/UX: How Users Can Shut Down Without Root Access (9/94)

=====

Article Created: 29 November 1990  
Article Reviewed/Updated: 23 September 1994

TOPIC -----

A system administrator at an A/UX site wants to give users the ability to power off their machines, but without giving them root access. Is the following procedure a suitable way to power down the machine? Here is what he did:

1) He modified the /mac/bin/Login file with ResEdit, changed the string Guest to poweroff (STR# resource), and modified the dialogs accordingly.

2) He compiled the following C program and named the executable poweroff:

```
poweroff.c
#include <stdio.h>

main(argc, argv)
int      argc;
char     *argv[];

{
    setuid(0);
    argv[0] = "reboot";
    execl("/etc/reboot", "reboot", "-h", 0); /* -- run reboot */
    /* -- NOTREACHED */
}
```

3) Poweroff\* was put in the /root directory and given these permissions:

```
# ls -l /root/poweroff
-rwsr-xr-x  1 root    root      2373 Aug 17 18:20 /root/poweroff
```

4) An account called "poweroff" was added to /etc/passwd that executes /root/poweroff when a user logs in under that name (or selects the power-off radio button in the Login screen). For example:

```
# grep poweroff /etc/passwd
poweroff::8:1000:user shutdown account:/root:/root/poweroff
```

The only possible problem with this is that a user could log on to another user's machine and shut it down. Giving the user a power-off password makes this unsuitable for installations where there is limited network discipline.

#### DISCUSSION -----

Your C code seems to meet the customer's need: shutting down A/UX without being root.

This additional code can be included in the poweroff.c to prevent a remote user from shutting down the system:

```
char *ttyname();
char *p;
char *d="/dev/ttyC";

p=ttyname(0);
if (strncmp(p, d, 9) != 0) {
    fprintf(stderr, "%s: not a CommandShell type of window\n", argv[0]);
    exit(1);
}
```

## LaserWriter: No Backup Utility for Non-Composite Fonts

Revised: 11/29/90  
Security: Everyone

LaserWriter: No Backup Utility for Non-Composite Fonts

=====

This article last reviewed: 13 November 1990

TOPIC -----

The documentation with the LaserWriter IINTX I/O board revision 3.0 upgrade tells users to back up the fonts stored on a hard disk connected to the LaserWriter IINTX before doing the upgrade. How do I make a backup of the fonts disk?

DISCUSSION -----

At present, there are no utilities specifically for backing up fonts stored on a LaserWriter hard disk.

Before installing the ROM upgrade, use the LaserWriter Font Utility (it comes with the LaserWriter IINTX) to reformat the hard disk. After installing the ROM upgrade and restarting the system, re-install fonts from the original floppy disks. (If you purchased your fonts from Adobe, already installed on a hard disk, contact Adobe for the procedure.)

Composite fonts are an exception: with the new version of the LaserWriter Font Utility (version 2.0.1, shipping with upgraded printers), you can back up composite fonts to floppy disks. (Composite fonts are small fonts hooked together to support Kanji and Chinese characters, which require more than the 256 characters supported in a single PostScript font.)

## LaserWriter: Printing Non-PostScript Files from a PC

Revised: 11/29/90  
Security: Everyone

LaserWriter: Printing Non-PostScript Files from a PC

=====

This article last reviewed: 12 November 1990

TOPIC -----

Some customers report problems printing to a PostScript LaserWriter from MS-DOS PCs equipped with LocalTalk PC Cards. From the PC, the printer appears in the Chooser and can be selected -- but it won't print such files as AUTOEXEC.BAT.

DISCUSSION -----

The problem may be that the LaserWriter was connected for use with PostScript files instead of plain text files. When AppleShare PC connects to a LaserWriter for PostScript use, it sends the raw data directly to the LaserWriter without modification. This doesn't work for typical DOS text files because they aren't in PostScript format.

The Epson emulation mode accepts standard text files and converts them to PostScript format before sending them to the LaserWriter. This is the mode you should use for printing AUTOEXEC.BAT and other non-PostScript files created by applications that support PostScript printing.

For most users, the best way to set up AppleShare PC is to make two connections to the LaserWriter: one for PostScript and the other for plain text. For instance, use LPT2 as the Epson connection and LPT3 as the PostScript connection. This uses slightly more conventional memory, but it allows you to print either type of document without altering configurations.

## Ethernet: DDP Client With DDP Type=69 ID

Revised: 11/29/90  
Security: Everyone

Ethernet: DDP Client With DDP Type=69 ID

=====

This article last reviewed: 12 November 1990

TOPIC -----

While checking Ethernet traffic, we noticed a large number of short (60-byte) EtherTalk packets (Phase 1) of an unknown protocol type. We opened the packet and found that they were DDP Type=69. The Ethernet is heavily loaded, especially with LAVC (Local Area VAX Cluster) traffic, and the apparently exclusive use of minimum size packets is a concern.

Can you identify the application that uses/produces these packets? We use 3COM servers and the older 3+Share Macintosh client software.

DISCUSSION -----

There is no way to tell which vendor creates packets with DDP Type=69 because Apple does not assign or control the use of DDP Type beyond \$0F.

We don't know if the packets come from the 3COM server, but you could try to find the Ethernet node by matching the 48-bit Ethernet source address in the 802.3 header and the Ethernet adapter hardware address.

## MultiGate Mac: General Information

Revised: 12/18/91  
Security: Everyone

MultiGate Mac: General Information

=====

Article Created: 5 October 1990  
Article Last Reviewed: 10 August 1992  
Article Last Updated:

TOPIC -----

MultiGate Mac is a software router/gateway for Macintosh II computers from Network Resources Corporation. It supports

- AppleTalk and TCP/IP routing
- IP in DDP encapsulation (MacIP support for MacTCP clients)
- Up to five Ethernet cards and one LocalTalk.

DISCUSSION -----

MultiGate Mac can run as a concurrent AppleShare application, or under MultiFinder or System 7 with a mail gateway. The only requirement is that an additional Ethernet card be used for other services besides the gateway, because MultiGate Mac requires dedicated cards for routing.

MacIP support lets MacTCP clients on LocalTalk access TCP/IP host computers. MultiGate Mac can be used to connect an AppleTalk internetwork to a TCP/IP backbone and provide IP in DDP encapsulation for up to 254 Macintosh computers anywhere on the AppleTalk internetwork. Flexible IP support allows for static addressing via MacTCP, MacTCP server mode, or a combination of the two.

MultiGate Mac also supports an alternative host access scheme, based on the MultiGate Stream Protocol. This user-friendly protocol is highly efficient on limited-bandwidth networks (LocalTalk, for example).

MultiGate Mac supports full TCP/IP interior gateway routing between Ethernet segments. This includes support for RIP, proxy-ARP, and RFC-950 subnetting.

SNMP support is also provided.

## Configuration

-----  
ConfigureIt!, a HyperCard stack, makes it easy to configure the gateway. ConfigureIt! builds a text file that is read by the gateway at startup. (This file can also be edited using TeachText.)

When MultiGate Mac reads the configuration file, it does extensive error checking to make sure the configuration is valid. It checks for syntax errors in the configuration file, and when the network protocols are initialized, it checks for such items as valid network numbers, consistent subnet masks, duplicate addresses, etc. If it detects an error, the gateway logs a message to the monitor, detailing the problem. The user can then correct the problem and try again.

Once the gateway is running, it continues to monitor the network. It shuts down only if it encounters a serious network error. In such a case, it logs a message to the monitor.

## Operations Interface

-----  
A password-protected Operations Interface is accessible via any computer capable of establishing a Telnet session. This powerful interface provides detailed information on gateway status, port statistics, and gateway configuration. It also provides detailed network information, including AppleTalk routing information, with statistics on network usage, IP routing, encapsulation mapping tables and activity, ARP and AARP tables, "pinging" of AppleTalk or IP devices, tracking and logging of network error packets, and so on.

The error tracking feature is useful for isolating network faults; it lets the user view the first 100 bytes of each protocol layer in an error packet that has been saved. This information can be used to pinpoint the offending entity. Over 100 network errors on the AppleTalk and IP networks are tracked.

## Features of the Telnet Interface

- 
- Prints AARP tables (AT->EN mapping tables).
  - Prints ARP tables (IP->EN mapping tables).
  - Prints the gateway configuration.
  - Evaluates expressions in octal, decimal, and hex.
  - DNS lookups of names.
  - Can dump specific portions of router memory (like MacsBug).
  - Prints a summary of various errors and events recorded by the router including: packets dropped due to unknown AT network, packets dropped due

to unknown EN address (via AARP), hop count overflow, error packets saved by router. Over 100 types of error packets are saved. The first 100 bytes of each protocol layer can be dumped for analysis to determine originating device, destination, type of packet, etc. Many events other than those listed above are recorded by the gateway.

- Logs errors to your screen in real time.
- Can define the format packets are logged with.
- Can log packets to/from a given address of given type in real time.
- Can shut down the gateway.
- Dumps address mapping for IP-in-DDP encapsulation.
- Prints summary of each TCP<->MSP connection.
- Prints the detailed state of a specific connection.
- Dumps the entire AT<->IP mapping tables.
- Dumps NBP address tables.
- Does an NBP lookup and prints the results.
- Dumps info about packet buffer at a given address.
- Sends and times Echo packets to the named host (AppleTalk or IP).
- Can restart the gateway.
- Dumps the RTMP tables for all AppleTalk nets.
- Dumps the RIP tables for all IP nets.
- Gives the RTMP or RIP entry for a defined network#.
- Prints the status of the gateway and detailed statistics on each port.
- Traces connections.
- Displays current software version.
- Flushes the ARP/AARP entry for a particular address.
- Dumps the RTMP table for each net in that zone.

#### Security

-----

The current version of MultiGate Mac provides the following:

- Filtering of inbound Telnet sessions to connected networks

- The ability to declare a network insecure. This means that the gateway won't respond to RTMP tables and RIP tables on a given network, unless the router providing the tables is statically configured in the gateway configuration file.

#### MultiGate 2000

-----

The functionality of MultiGate Mac is also available with NRC's dedicated LocalTalk-to-Ethernet hardware router, MultiGate 2000. The software module, called IPGate, provides all the features of MultiGate Mac other than Ethernet-to-Ethernet routing. Instead of logging start-up errors to the screen, IPGate logs them to NVRAM and then reboots from PROM code (ensuring that the router will come back up). MultiGate Manager Jr. can then be used to retrieve the error code from NVRAM. Users can then analyze the error, make the appropriate corrections to the router configuration, and then download a new image to the router.

For more information, search on "Network Resources".

## Macintosh IIci: Built-in Video Memory Usage

Revised: 7/10/92  
Security: Everyone

Macintosh IIci: Built-in Video Memory Usage

Article Created: 14 November 1990  
Article Last Reviewed: 10 July 1992  
Article Last Updated:

TOPIC -----

I have a problem with a Macintosh IIci with 1MB of RAM, which allows only the Black/White option in the control panel -- even though the monitor is RGB. Is there a way to increase the RAM video to allow using 256 colors?

DISCUSSION -----

A Macintosh IIci system with 1MB RAM supports up to 256 colors or grays, using RAM-based video (RBV). This chart details how much memory is used:

|                          |      |
|--------------------------|------|
| 2 Colors/Grays (1-bit)   | 64K  |
| 4 Colors/Grays (2-bit)   | 96K  |
| 16 Colors/Grays (4-bit)  | 160K |
| 256 Colors/Grays (8-bit) | 320K |

A 1MB Macintosh IIci system using 8-bit video would, in effect, be a 704K system. This is not recommended, because it doesn't leave much memory for the System software and application programs.

A 1MB Macintosh IIci system defaults to 64K of memory allocated for video. A Macintosh IIci system with more than 1MB defaults to 320K of memory allocated for video.

Here's how to adjust the amount of memory allocated to video:

- 1) In the Control Panel, select the Monitors CDEV.
- 2) Hold down the Option key. The icon that represents the built-in video will contain a very small Macintosh in addition to the monitor number.

3) Click on the "Options..." button.

The setting in the top half of the dialog allows the user to select the gamma table that is to be used to compensate for phosphor luminosity characteristics of specific monitors. This setting is not unique to the Macintosh IIci and has nothing to do with the amount of memory that is allocated to video RAM.

The bottom half of the dialog, labeled "Memory Allocation For Built-In Video", contains the radio buttons for setting how much memory is allocated to video. This setting limits the maximum number of colors/grays that will be supported.

A/UX 2.0: How To Turn Off 32-Bit Clean Warning Message

=====

Article Created:13 November 1990  
Article Reviewed/Updated: 17 August 1993

TOPIC -----

How do I remove the 32-bit clean warning that appears when I launch an application? I know A/UX checks a certain bit within the application, but I don't know which one.

DISCUSSION -----

In A/UX 2.0, there are two ways to set the bit:

- From an A/UX CommandShell window, issue the command:

```
/mac/bin/changesize +32BitCompatible 'Pathname:Application'
```

For example:

```
/mac/bin/changesize +32BitCompatible 'MacPartition:MS Word:Microsoft Word'
```

- From A/UX MultiFinder Desktop, open the Macintosh application with the ResEdit program, open the SIZE resource, look for the "32 Bit Compatible" flag, and set it to 1.

## AppleCD SC: Device Driver Status Calls

Revised: 11/29/90  
Security: Everyone

AppleCD SC: Device Driver Status Calls

=====

This article last reviewed: 14 November 1990

TOPIC -----

My questions concern the AppleCD SC's SCSI driver. In my application (written in C), I do a Status Call #98 (called GET SIZE). I receive back 11 words (22 bytes):

```
08 00 00 4A DA
23 00 3C 85 C8
00 4A F9 B8 20
00 00 4B 01 1A
20 24
```

- 1) Is this the standard size to be returned by this call?
- 2) Is there a minimum and maximum size?
- 3) What is the format of this response?

DISCUSSION -----

The information you're looking for is in the AppleCD SC Developer's Guide, available from APDA. It describes all of the device driver Status calls for the AppleCD SC, including the inputs and the outputs for each Status call.

In response to your specific questions about Status call 98 (GetSize):

- 1) The default block size is 2048 bytes.
- 2) The legal block sizes (in bytes) for the AppleCD SC driver are:  
512, 256, 1024, 2048, 2336, and 2340
- 3) The GetSize Status call will return in scParam + 0 the currently assigned

logical block size of the AppleCD SC. In other words, in the first two bytes (one word) it returns the logical block size, which by default is 2048.

In your example, the first two bytes are 08 00. 0800 in hex translates to decimal 2048 -- the default size set for the AppleCD SC. The remaining 20 bytes are not used for this call.

HyperCard 2.0: "Link to" Problem on 68000-Based Systems

=====

This article last reviewed: 13 November 1990

TOPIC -----

I'm having a problem with HyperCard 2.0. I get an ID=02 bomb when I do the following:

- Create a new stack.
- Create a new button.
- Use "Link to" to link the button to this card.
- Use "Link to" to link the button to this card.

It's the second LinkTo function that causes the bomb.

DISCUSSION -----

This is a known problem that seems to occur only on 68000-based Macintosh systems.

As a workaround, delete the line "go to card xxxx" from the button's script before modifying the link.

## EtherTalk NB Card: Revisions L and M Are Functionally Identical

Revised: 7/2/92  
Security: Everyone

EtherTalk NB Card: Revisions L and M Are Functionally Identical

=====

Article Created: 15 November 1990  
Article Last Reviewed: 26 June 1992  
Article Last Updated:

TOPIC -----

What are the differences between revision L and revision M of the Apple  
EtherTalk NB Card?

DISCUSSION -----

As of November 14, 1990, the Apple EtherTalk NB Card started shipping as revision "M". The revision M EtherTalk NB Card has no functional modifications or differences from the revision L EtherTalk NB Card. The revision from "L" to "M" was made because of a process change in manufacturing and not because of any bug fixes or enhancements to the card.

## A/UX: Solution to /etc/mtab: No such file or directory Error

Revised: 9/14/92  
Security: Everyone

A/UX: Solution to "/etc/mtab: No such file or directory" Error

=====

Article Created: 29 November 1990

### Article Change History

-----

08/31/92 - REVIEWED  
•For technical accuracy

### TOPIC -----

I tried to mount a file system and got the error:

/etc/mtab: No such file or directory

### DISCUSSION -----

(A) Check for /etc/mtab. The file /etc/mtab must exist for the mount command to work.

- 1) Log onto the system as "root".
- 2) Enter the line, "ls -l /etc/mtab".

The output displayed should look like this:

```
-rwxr-xr-x  1 root    sys      147  Apr 25 14:07 /etc/mtab
```

The size and modification date of this file will differ on your system.

If the output is "/etc/mtab not found", then, the file /etc/mtab is missing and must be created. This series of command lines will create the file /etc/mtab with the correct permissions and ownerships:

- 1) Enter the line: touch /etc/mtab

2) Enter the line: `chgrp sys /etc/mtab`

3) Enter the line: `chmod 755 /etc/mtab`

(B) Check Permissions on the file `/etc/mtab`.

Incorrect permissions on the file `/etc/mtab` could cause this error.

1) Log onto the system as "root".

2) Enter the line: `ls -l /etc/mtab`

The output displayed should look like this:

```
-rwxr-xr-x  1 root    sys      147  Apr 25 14:07 /etc/mtab
```

The size and modification date of this file will differ on your system.

3) If the first column of the output displayed does not equal:

```
-rwzr-xr-x
```

enter the line: `chmod 755 /etc/mtab`

This will correct the file permissions.

Macintosh Plus: SCSI Device and Driver Support Limits

=====

Article Created: 3 December 1990  
Article Last Reviewed: 24 July 1992  
Article Last Updated:

TOPIC -----

How many SCSI drivers does the Macintosh Plus support according to Apple's specifications? Are there any restrictions on the type or nature of those drivers?

DISCUSSION -----

There are no "published" specifications regarding how many SCSI drivers the Macintosh Plus can have loaded into memory at one time. A typical SCSI driver uses about 5K of memory. If you attached seven SCSI devices, you would use around 35K of memory for their drivers. This 35K or even 50K does not pose a problem. The real problem you have with the Macintosh Plus and SCSI devices is the electrical limitation. Four to five devices is probably the maximum that you can put on the SCSI bus due to the load placed on the SCSI bus by the SCSI devices.

## LaserWriter IINTX: Printing HPGL Files from a PC

Revised: 12/14/90  
Security: Everyone

LaserWriter IINTX: Printing HPGL Files from a PC

=====

This article last reviewed: 3 December 1990

TOPIC -----

Can I write HPGL files from a PC to a Macintosh LaserWriter IINTX without converting them to PICT or PostScript?

DISCUSSION -----

Briefly, the LaserWriter IINTX emulates an HP LaserJet Plus. LaserJets use PCL, not HPGL. A PC printing an HPGL print job cannot print to a LaserWriter IINTX.

Hewlett-Packard uses different printer control languages, including HPGL and PCL, for their different printers. HPGL is commonly used by CAD/CAM type programs for outputting to plotters. PCL is used by more common, generic programs for outputting to HP LaserJets and similar printers.

Apple's PostScript LaserWriters emulate Diablo 630s. Additionally, the LaserWriter IINTX emulates an HP LaserJet Plus; therefore, a program that uses PCL and is LaserJet-Plus-compatible can print to the LaserWriter IINTX when the LaserWriter IINTX is in its LaserJet Plus emulation mode. Again, you cannot print an HPGL print file directly (without file translation) on the LaserWriter IINTX.

If you want to print to an Apple LaserWriter, you must use a program that supports a Diablo 630, LaserJet Plus, or PostScript-compatible printer. If your program and drivers do not support these types of printers, you need to export and, possibly, translate the data before importing the data to a program that does--whether that program runs on a PC, Macintosh, or another system. Software that might help you includes PlotView and CADMOVER.

PlotView (formerly called MacHP) from Stevens Creek Software allows you to open and display Macintosh HPGL files on a Macintosh, and copy and paste them into other Macintosh programs for embellishment before printing to a

LaserWriter. If you can use Apple File Exchange or a similar program and perform a generic text translation on the PC HPGL file, you can then open it with PlotView. This may work, but may require a little experimentation and manipulation with ResEdit or similar programs. Another option is to write your own AFE translator.

Another program that may work is called CADMOVER from Kandou, which is a 2-D/3-D Macintosh-based vector graphics translation utility, with bidirectional IGES, DXF, PICT, MacDraw, Minicad+, MacConcept, HPGL, Minicad+, Dimensions, Hyperspace, and Space Edit.

We feel the easiest solution would have been to select a program on the PC that also prints to a PostScript printer or, at least, use a program that can save the file in a format (not just an HPGL print file) that can also be read by other Macintosh or PC programs that can print to a PostScript printer. There may be PC programs that open HPGL files and save in a more commonly used file format.

## Internet Router: Local Net Setup Conflict

Revised: 12/14/90  
Security: Everyone

Internet Router: Local Net Setup Conflict

=====

This article last reviewed: 13 November 1990

TOPIC -----

Regarding the AppleTalk Internet Router, what conditions cause the Local Net Setup Conflict statistic (shown in the Port Statistics window)? How do you locate and correct the problem?

DISCUSSION -----

The AppleTalk Internet Router manual states:

"A Local Net Setup Conflict error is reported if another router on a network that is directly connected to this router lists a conflicting network number or range for that network."

This statement indicates that there is another router on the same physical cable as the AppleTalk Internet Router that is advertising a network number or range for that physical cable that is different from the network number or range in use by the AppleTalk Internet Router. The key to correcting the problem is to locate the routers that are attached to the physical cable with the problem and verify that they all are using the same network number or range for that physical cable.

## A/UX: Troubleshooting Tape Backup Problems

Revised: 9/29/92  
Security: Everyone

A/UX: Troubleshooting Tape Backup Problems

=====

Article Created: 13 November 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I haven't been able to back up much of anything. I tried to back up my X11R4 source disk (about 72MB), and "tar" keeps failing on the second tape. I tried:

```
tar clvBf 16 72000 - | tcb > /dev/rmt/tc1
```

and tcb failed with an I/O error after about seven files were written to the second tape.

I tried:

```
tar clvBf 72000 - | tcb > /dev/rmt/tc1
```

and got the same error in the same place.

I also tried:

```
tar clvBf 16 72000 /dev/rmt/tc1
```

This command backed up well into the second tape (but very slowly) and failed with a memory fault error.

The cmdo dialog for tar (using the tape cartridge) generates a command line:

```
tar clvBf 16 4500 /dev/rmt/tc1
```

which writes only 4500 512-byte blocks to the tape.

Express Tape (a commercial backup product) fails on the third tape, when I try to back up the root partition.

I noticed the "time slice" parameter has dropped from 60 ticks to 5 ticks. If I run the "plaid" demo and a few more xdemos, things grind to a halt much more quickly than in version 1.1. (I have not yet received the A/UX driver that turns on the cache for the accelerator.)

Can you help?

#### DISCUSSION -----

The first thing we noticed was a minor typo in each of the above command--they lack the input file(s) or directories. The first one, for example, should have an input file (/source-tree, for instance) specified in the command line:

```
tar clvbBf 16 72000 - /source-tree | tcb > /dev/rmt/tc1
```

We can't reproduce the problem. We used the command below to back up the entire root (/) directory onto two tape cartridges without any I/O error.

```
tar clvbBf 16 72000 - / | tcb > /dev/rmt/tc1
```

The problem with the "tar" command failing on the second tape cartridge may be bad spots on the second tape cartridge. Try replacing that tape cartridge with a new one.

The time slice parameter SLICE is set to 5 by default. However, the kconfig(1M) still states 60. This is an inconsistency. Try adjusting to a different value to fit your needs.

## A/UX 2.0: NBUF Values

Revised: 9/14/92  
Security: Everyone

A/UX 2.0: NBUF Values

=====

Article Created: 14 December 1990

### Article Change History

-----

08/31/92 - REVIEWED

•For technical accuracy.

### TOPIC -----

I have an 8MB Macintosh. NBUF has a value of 337. The buffer size appears to have doubled since the last release--I was running with NBUF=1000 in A/UX 1.1. Should NBUF be increased? Do you have any tuning suggestions?

### DISCUSSION -----

In A/UX 2.0, the default NBUF value is 10% of the available memory after A/UX is booted, and the SBUFSIZE now is 2048 instead of 1024. The value of NBUF can be adjusted to fit your environmental needs via the "kconfig -n /unix" command. Increasing the number of buffers reduces the memory available for applications and may cause more paging.

## Printing: High-Volume Solutions from Printronix

Revised: 12/14/90  
Security: Everyone

Printing: High-Volume Solutions from Printronix

=====  
This article last reviewed: 14 November 1990

TOPIC -----

My company does high-volume printing (about 50,000 pages a month). Do you have a solution fthat can handle this volume? The printer should be a 300 to 400 lpm printer. Can you help?

DISCUSSION -----

We have seen Printronix P300-XQ and P600-XQ line printers working with Macintosh computers. This particular configuration used a serial-to-parallel converter to attach the Macintosh serial port to the parallel port of the Printronix. An ImageWriter driver with "Draft" selected was used as the printer driver. Again, this is not a support solution although it seems to work.

An alternative (although still unsupported) could include any mini/mainframe line printer that works with ASCII-based systems and a printer driver construction set, from DataPak Software, called Printer Interface II. Printer Interface II lets the user customize several aspects of the printer driver providing a method to send the correct printer control codes to the mini/mainframe line printer.

The Printronix P300-XQ does 300 to 400 lpm. The Printronix P600-XQ does 600 to 800 lpm. The lower numbers represent compressed printing; the higher numbers represent standard draft mode.

For more details, search the Technical Info library under "Printronix" and "DataPak Software"

## Personal LaserWriter NT: Upgrading RAM to 8MB

Revised: 7/27/93  
Security: Everyone

Personal LaserWriter NT: Upgrading RAM to 8MB

=====

Article Created: 19 November 1990  
Article Reviewed/Updated: 23 July 1993

TOPIC -----

The Personal LaserWriter NT literature states that you can upgrade the RAM in the printer to 8MB. How is this done?

DISCUSSION -----

The Personal LaserWriter NT has two SIMM sockets that can accept either 1MB or 4MB SIMMs. Because both SIMMs must be of the same density, the total RAM can be either 2MB or 8MB. The Personal LaserWriter NT ships with two 1MB SIMMs. Therefore, the only upgrade path is to replace the two 1MB SIMMs with two 4MB SIMMs.

The requirements for the 4MB SIMMs are the same as for standard Macintosh II SIMMs, but they must be rated at 100ns or faster. They must also fit in a significantly smaller space than the Macintosh II family allows. This eliminates 4MB SIMMs made from lots of 1MB DRAM chips.

Here are several vendors that advertise compatible 4MB SIMMs:

The Chip Merchant  
MacCenter  
MacSystems/Lifetime Memory Products  
Memory Plus  
Stratum Technologies

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## A/UX: AppleShare, GatorBox and Oracle (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: AppleShare, GatorBox and Oracle (8/94)

Article Created: 19 November 1990  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

I have an existing LocalTalk-based network currently accessing an AppleShare File Server. I want to set up an Oracle database under A/UX and would like to be able to access the database from existing Macintoshes on LocalTalk. At the same time, I want to be able to access the A/UX system as an AppleShare file server.

I think I can use a GatorBox with GatorShare to set up the A/UX system as a server. Can the workstations talk to the Oracle database with this type of setup?

DISCUSSION -----

You are correct that you need the GatorBox. However, GatorShare lets Macintoshes access an NFS server as if it were an AFP server. Oracle supports MacTCP connection via both LocalTalk and straight over Ethernet. The A/UX Macintosh does not have to be an NFS file server.

Also, you should be able to access the Oracle database and use the NFS server mounted on your desktop simultaneously.

The Macintosh running A/UX should have the full Oracle database software for A/UX. All other Macintoshes that need to access the server should be running MacTCP and the Network Station Oracle software. This Network Station software includes SQLNET for TCP and other utilities minus the database. In this case, your workstations communicate with the server via TCP/IP and SQLNET (not using AFP or NFS protocols), so you don't need GatorShare.

Canon Fax to Macintosh Connectivity Solution (11/94)

Article Created: 05 November 1990  
Article Reviewed/Updated: 28 November 1994

TOPIC -----

I'm trying to interface my Canon Laser Fax machines models L770 and L920 to a Macintosh II. The Canon machines feature RS-232 interfaces. Has anyone heard of Fax software for the Macintosh that lets these machines work with a Macintosh?

DISCUSSION -----

We don't know of any Fax software that lets you interface a Macintosh with a Canon laser printer/Fax machine. Some manufacturers that design Fax machines license their interfaces to other Fax manufacturers. If the Canon laser printer/Fax machine was designed to interface to a computer, and if the interfacing logic is similar to an existing Fax machine, perhaps some existing software for another Fax machine might also work with the Canon laser printer/Fax.

Some third-party products support fax machines that use interfaces similar to the TE Fax (Relisys), AppleFax (Apple Computer), Flex Fax (Circuit Research), Orchid Modem (Orchid), and ProModem (Prometheus Products). However, we don't know of any specific software available for the Macintosh that lets you interface to this product from Canon.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## Macintosh-to-Siemens/Nixdorf Connectivity

Revised: 12/18/90  
Security: Everyone

Macintosh-to-Siemens/Nixdorf Connectivity

=====

This article last reviewed: 5 November 1990

TOPIC -----

I need to connect a Macintosh to a Siemens mainframe H60, running the PS2000 Operating System. I also need to connect a Macintosh to a Nixdorf M15-8870, running under UNIX.

Can you help?

DISCUSSION -----

We contacted Siemens in the U.S., and they don't know of a solution for the Macintosh to connect to their H60 mainframe running BS2000 Operating System. In general, their H60 supports TCP/IP and RS-232, communication protocols and interfaces for terminals, modems, and IBM PCs connections. Because MacTCP and RS-232/422 are supported by Macintosh, you can make a simple connection between a Macintosh and the Siemens H60 mainframe. However, we don't have any specific connectivity solutions for a Macintosh and the H60 mainframe.

According to Nixdorf, there is no 8870 model running under UNIX, but their Targon/31/35 series does run UNIX. The 8870 models run under Nixdorf's proprietary operating system called NIROS. The 8870 models support multi-users, RS-232, CCITT V.24 interfaces, SDLC, BSC, asynchronous and synchronous protocols, and IBM 2780/3780/3740/3270 protocols.

Again, you can connect to the two machines, provided the underlying protocols and/or interfaces are supported by both machines (Macintoshes and third parties).

## MacX & MacTCP: unimplemented co-routine error 12 (11/94)

Revised: 11/7/94  
Security: Everyone

MacX & MacTCP: "unimplemented co-routine error 12" (11/94)

=====

Article Created: 5 November 1990  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I am running a Macintosh Portable with MacTCP and MacX. When starting up MacX, I get the error message "unimplemented co-routine error 12." I get the same error message when I try to use NCSA Telnet without MacTCP. The same configuration worked on other Macintoshes.

Do you know of any problems using these two software components on a Macintosh Portable?

DISCUSSION -----

The problem may be improper installation of CommToolbox, MacTCP, and/or MacX. We tested both MacX and NCSA Telnet 2.3 on a Macintosh Portable and didn't have any problem. Here are some things to check:

- Make sure that the CommToolbox is properly installed and that the "Communications Folder" folder was created in the "System Folder".
- Make sure that the "MacTCP" and "AdminTCP" CDEVs are in "System Folder" and that the "MacTCP Tool" comm tool is in the "Communications Folder" folder.
- Make sure that all MacX fonts are installed in the "MacX Fonts" folder.
- Make sure that MacTCP is properly configured on the network.

## A/UX 2.0: settc and daiw Commands

Revised: 9/14/92  
Security: Everyone

A/UX 2.0: "settc" and daiw" Commands

Article Created: 5 November 1990

### Article Change History

-----  
08/31/92 - REVIEWED  
•For technical accuracy.

### TOPIC -----

I cannot find two programs: "daiw" (the TROFF output formatter for the ImageWriter) and "settc" (set type and creator) commands under A/UX 2.0. I checked a "known good" master of A/UX 2.0, and I got this:

```
grep -i daiw /FILES
/mac/lib/cmdo/d/daiw      Commando dialog source script for the daiw command
/usr/catman/u_man/man1/daiw.1.z    formatted manual entry for daiw(1)
```

This indicates that there is a Commando dialog and a man page, but no executable daiw command. A "find" on the entire file system produced similar results.

Likewise, I searched for "settc":

```
grep -i settc /FILES
/usr/catman/u_man/man1/settc.1.z    formatted manual entry for settc(1)
```

As you can see, there is a man page, but nothing else. Have these commands been removed from A/UX 2.0? Will they be replaced?

### DISCUSSION -----

We verified that neither the /usr/bin/daiw command (and its associated fonts /usr/lib/font/devi/\*) nor the /mac/bin/settc program is present in the

released version of A/UX 2.0. Manual pages for settc (1) and daiw(1) are still available though.

The missing "settc" had been reported by others; "settc" has been replaced by the "setfile" command in the /mac/bin directory in A/UX 2.0. However, there is no manual page entry for "setfile". According to A/UX Engineering, the "setfile" command syntax is the same as MPW:

```
setfile [options] file
```

options include:

```
-a attributes    # attributes (lowercase = 0, uppercase = 1)
-c creator       # file creator
-d date          # creation date (mm/dd/yy [hh:mm[:ssIIAM|PM]])
-l h,v          # ICON location (horizontal, vertical)
-m date          # modification date (mm/dd/yy [hh:mm[:ssIIAM|PM]])
-t type          # file type
```

Note: Period (.) represents the current date and time.

The following attributes may be used with the -a option:

```
L   Locked
V   Invisible
B   Bundle
S   System
I   Initd
D   Desktop
M   Shared (can run multiple times)
A   Always switch launch (if possible)
```

## Personal LaserWriter NT: PageMaker 4.0 APD Workaround (8/95)

Revised: 8/23/95  
Security: Everyone

Personal LaserWriter NT: PageMaker 4.0 APD Workaround (8/95)

Article Created: 18 December 1990  
Article Reviewed/Updated: 23 August 1995

TOPIC -----

Where can I get the APD file that's needed by a Personal LaserWriter NT running PageMaker 4.0? (Evidently, the LaserWriter II version of APD works, but it displays spurious messages while you use it.)

DISCUSSION -----

APD (Aldus Printer Definition) are files that Aldus provides primarily to their PageMaker customers. Apple does not supply Aldus Printer Definition files to PageMaker customers. Apple and third-party printer manufacturers do provide information to Aldus, so they can create their APD file for the specific printers.

Aldus Technical Support indicated that a Personal LaserWriter NT APD would be available sometime in the future. In the meantime, they provided a workaround for the only known issue when using the LaserWriter IINT APD with the Personal LaserWriter. A dialog box appears after the Print menu item has been selected. The dialog states:

Check printer type.

If you have trouble printing to  
"{name of printer}" change "Printer:" from  
"{current APD}" to "{printer type}"  
in the Print dialog box.

For the described situation, it would read:

Check printer type.  
If you have trouble printing to  
"{name of printer}" change "Printer:" from  
"LaserWriter IINT" to "LaserWriter

Personal NT" in the Print dialog box.

To eliminate this dialog box from the printing process, do these steps:

- 1) Copy the exact names in the "{current APD}" field and in the "{printer type}" field of the "Check printer type" dialog. In this case:

```
"{current APD}" = "LaserWriter IINT"  
"{printer type}" = "LaserWriter Personal NT"
```

and Quit PageMaker.

- 2) Make a copy of the "LaserWriter IINT.apd" file.
- 3) Open the copy with a word processor or text editor.
- 4) Locate all occurrences of "LaserWriter IINT" and change to "LaserWriter Personal NT".
- 5) Save the copied and modified file in text format with the name "LaserWriter Personal NT.apd". Be sure the .apd extension is included.
- 6) Exit the word processor/text editor and restart the Macintosh.
- 7) Launch PageMaker, go to the Print dialog box, and select "LaserWriter Personal NT" from the "Printer:" popup menu.

## AppleShare PC: 3COM EtherLink MC Card Problems

Revised: 12/18/90  
Security: Everyone

AppleShare PC: 3COM EtherLink MC Card Problems

=====

This article last reviewed: 5 November 1990

TOPIC -----

I have an IBM PS/2 model 55SX with 1MB RAM, 3COM EtherLink/MC card, MS-DOS 3.3, and AppleShare PC 2.01. The server is a Macintosh IIcx with HD80 SC and 4MB RAM with AppleShare 2.0, Internet Router 2.0, and a 3COM Ethernet card. The printer is a LaserWriter IINT. I can reach the printer. The PS/2 recognizes the server on the network, but can't mount it. For example, the F2 button is not enabled in the Chooser on the PS/2. The system asks me to run REDIR, but when I do, I get a Divide Error.

Here is the CONFIG.SYS file:

```
buffers=8
country=047, 865, c:\dos\country.sys
device=c:\dos\ANSI.sys
device=c:\dos\display.sys con:=(ega,865,1)
```

```
files=20
lastdrive=g
device=pro.sys 8 2 2
device=eth523.sys
device=buf.sys
device=idp.sys
device=spp.sys
device.lgl.sys
devise=epath.sys
```

DISCUSSION -----

After unsuccessfully trying to duplicate the problem, I noticed what you entered for the CONFIG.SYS file. It looks like the 3COM installer was used at some time before trying AppleShare PC. All 3COM software must be inactive for AppleShare PC to operate. The 3COM software and the AppleShare PC drivers

conflict with each other.

Remove the following lines from the CONFIG.SYS file:

```
device=pro.sys  
device=eth523.sys  
device=buf.sys  
device=idp.sys  
device=spp.sys  
device=lgl.sys  
device=epath.sys
```

It is also a good idea to remove any lines from the AUTOEXEC.BAT file that reference 3COM software. These lines will begin with runminds, msredir, or nb.

## Teradata DB and DAL Support

Revised: 2/16/93  
Security: Everyone

Teradata DB and DAL Support

=====

Article Created: 18 December 1990

### Article Change History

-----

02/16/93 - UPDATED

- Teradata now NCR/Teradata Corp.

06/30/92 - REVIEWED

- For accuracy.

### TOPIC -----

I want to buy Teradata equipment, and I want an ad hoc query tool. Teradata offers something I haven't seen yet--EQT. Is there any relationship between that and the EQT for DAL (formerly CL/1)? Because we are interested in ClearAccess, when can we expect a DAL driver for the Teradata?

### DISCUSSION -----

We don't know of EQT from Teradata (now NCR/Teradata Corp.). From what we understand, the datamodels provided by Teradata database machines, like DBC/1012 models 2 and 3, are relational, and they are SQL-based. So it is possible to write a Data Access Language adapter for it.

As of release 1.3 DAL for MVS servers (TSO and VTAM) also support Teradata access.

EQT (Executive Query Tool) is a query tool developed by Red Brick Systems. It provides point-and-click access to relational databases, regardless of the workstation platform, the database server, or the server hardware. It runs on Macintosh and DOS Windows. Future releases will run on the OS/2 Presentation Manager, and UNIX workstations. It can retrieve data from Teradata, Oracle, Ingres, Sybase, DB2, Informix, and Rdb databases.

EQT for CL/1 is an old name for an announced product called Claris Query Tool, which uses three mechanisms to access databases: Data Access Language

## ..TIL06366-Teradata\_DB\_and\_DAL\_Support.pdf

(DAL from Network Innovations), DB Library (Sybase), and SQL-Net (Oracle). The Claris Query Tool will be shipped in 1991. For more information about Claris Query Tool, please contact Dennis Ryan, Product Manager at Claris.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## Folder Cannot Be Deleted: How to Fix

Revised: 12/18/90  
Security: Everyone

Folder Cannot Be Deleted: How to Fix

=====

Article Created: 5 November 1990

### Article Change History

-----

08/25/92 - REVIEWED

- For technical accuracy and edited.

### TOPIC -----

There is a folder that I cannot delete from an AppleShare server. I have rebuilt the desktop, reinstalled system software and AppleShare, and even started the server without AppleShare, so I could try to throw the folder away directly. Also, any file that is put into this folder disappears.

What is causing this to happen? Could it be bad sectors on the disk? How can it be most easily fixed?

### DISCUSSION -----

The most likely cause of the problem you describe is a corrupted directory structure. This type of problem could happen either on an AppleShare server or an individual Macintosh. Here is what we suggest:

- 1) Use Disk First Aid on the volume; this will sometimes repair slightly damaged directories.
- 2) Run "The Norton Utilities for the Macintosh", "Symantec Utilities for the Macintosh", or equivalent package to try to repair the volume. These utilities can repair damaged directories that Disk First Aid cannot.
- 3) Back up all the data on the hard disk and reformat it. This will solve the problem if all else fails.

## Macintosh: Connecting NTSC Devices to the Macintosh

Revised: 6/8/92  
Security: Everyone

Macintosh: Connecting NTSC Devices to the Macintosh

=====  
Article Created: 18 December 1990  
Article Last Reviewed: 1 June 1992  
Article Last Updated: 1 June 1992

### TOPIC -----

I have a 25-Inch Sony Trinitron KX-2501A, a 40-Inch Mitsubishi VS-4003R and a Sony high-resolution projector, Model VPH722Q1.

I want to be able to use them for a presentation.

How can I tie these displays (RGB and/or composite) into a Macintosh II?  
Eventually, I want a capability for all three displays.

### DISCUSSION -----

We have been unable to track down any information on the Sony Trinitron KX-2501A. Generally, when a Sony product has the Trinitron title it is a consumer-level display unit. Extrapolated from that, it most likely provides NTSC input rather than RGB input.

The Sony VPH722Q1 is an NTSC composite projector. To provide the high-quality Macintosh images to which people are accustomed, a video projector that accepts RGB input at a horizontal scan rate of 22 MHz should be used. Generally, these projectors are known as having data projection capabilities. The Sony VPH722Q1 is not considered by Sony as a data projection unit.

The Mitsubishi VS-4003R accepts only NTSC input. Using the above assumption concerning the Sonys and the fact that the Mitsubishi is NTSC, the following information applies to connecting NTSC devices to the Macintosh.

The Macintosh standard video output is RGB. To display this video output on a NTSC device certain things need to take place:

- The typical scan rates for RGB are much higher than that of NTSC; this scan

rate must be lowered to meet the NTSC RS-170-A specifications.

- RGB is a component video signal, NTSC is a composite video signal; the RGB signal must be converted to the composite signal.
- The RGB cable is a multi-conductor cable. The NTSC cable is a two-conductor cable. The device that does the RGB-to-NTSC conversion typically provides the correct output connector for NTSC, and sometimes provides a pass-through for RGB.

The scan rates are determined by the video card residing in the Macintosh. Therefore, the first item to address is the video card to be used. Some video cards are designed as RGB scan rates only. Some can be configured to the appropriate rate. Others can output NTSC scan rates only. If you have a video card that can be configured to the correct rate, the addition of the converter and cable is all that is required. If your current card is RGB only, then you need a new card.

Once a video card configurable to NTSC scan rates is present in the Macintosh, the next step is to locate a converter box that works with the particular video card in use. Sometimes this box is available only from the manufacturer of the video card, other times third parties provide a selection to choose from. This depends on the card.

When a converter box that works with the video card is located, the remaining step is to plug the NTSC output of the box into the NTSC input of the monitor. This is exactly like plugging a VCR into a television. Most often this is a RCA-type phono plug to RCA-type phono plug cable.

The other common connector is the BNC connector. Adapters are available to convert the connectors from one style to the other. The newer converter boxes appearing on the market also offer an S-Video connection. These connectors are mini-4 connectors (similar to Apple's Mini-8 connectors). They are found on newer televisions, monitors, Hi-8mm/Super-VHS/EdBeta video cassette recorders, and camcorders. The S-Video connection yields a higher-quality image than the usual NTSC signal. S-Video, however, is still an NTSC signal.

There are image issues when sending the Macintosh screen to NTSC devices, due to the lower-quality image of the NTSC environment. The simplest rule is "develop your presentation on an NTSC monitor". Most of the other issues fall into place if this rule is followed.

You can minimize other issues facing NTSC images with these tips:

- Use larger font sizes -- 24 points minimum.
- Use color palettes designed for the NTSC environment (MacroMind Director includes an NTSC palette).
- Use larger graphic images, small details disappear.
- Use two-pixel-wide horizontal lines to avoid flicker.

## ..TIL06370-Macintosh-Connecting\_NTSC\_Devices\_to\_the\_Macintosh.pdf

- Centering the information, outer edges disappear from display (known as NTSC safe area or TV safe area).

The Macintosh Display Card 4/8, 8/24, and 8/24 GC can be used with NTSC/S-Video devices by including either RasterOps' Video Expander Box or Truevision's VIDI/O Box. Both of these RGB-to-NTSC converters let the new Macintosh Display Cards' signal be sent to NTSC/S-Video televisions and video recorders. For additional information about the details of connecting the Macintosh Display Cards to NTSC, search under "Macintosh and NTSC".

## LaserWriter IINTX: Serial Connection Parameters

Revised: 12/18/90  
Security: Everyone

LaserWriter IINTX: Serial Connection Parameters

=====

This article last reviewed: 5 November 1990

TOPIC -----

I have a LaserWriter IINTX attached serially to a Novell Netware server and am trying to print PostScript files. But it's not working.

The LaserWriter is configured for PostScript, serial interface, and DSR/DTR handshaking. The port settings are 9600 baud, no parity, 7 data bits, 1 stop bit, and no XON/XOFF. The server settings match and the cable is a full handshake cable.

DISCUSSION -----

Check the data bits setting; the default LaserWriter IINTX setting is for 8 data bits. Switching the server to 8 data bits, or the LaserWriter to 7 data bits should solve the problem. The new "LaserWriter IINT/NTX Owner's Guide" correctly states that 8 data bits is the default. Also, check the following to be sure all settings are correct.

It sounds like you have the server connected permanently to the serial port. We are assuming that the DIP switches are set for this configuration. The DIP switches should be set to:

- Switch 1: Down
- Switch 2: Down
- Switch 3: Up
- Switch 4: Up
- Switch 5: Up
- Switch 6: Down

This sets the LaserWriter IINTX RS-232 port to 9600 baud and the RS-422 port to 0 baud and sets the LaserWriter to PostScript batch mode and DSR/DTR handshaking. These will remain as the default settings for the LaserWriter until the switches are changed.

The other default settings that you cannot set with the DIP switches are no parity check, 8 data bits, and 1 stop bit. You change these parameters and those set with the DIP switches by using PostScript.

The PostScript code that you need to send to the LaserWriter IINTX to change these parameters is:

```
serverdict begin 0 exitserver
statusdict begin PORT BAUD OPTIONS setsccbatch
```

In place of PORT, you need to put the number of the port you want to change. Replace PORT with 9 for the RS-422 port and with 25 for the RS-232 port. The BAUD parameter is simply the data transfer rate you want to use.

The OPTIONS parameter is a little more difficult. You need to know what kind of parity you want to use, what kind of handshaking you want to use, how many data bits, and how many stop bits. Use Table C-1 on page 121 of the LaserWriter IINT/NTX Owner's manual (Table C-5 on page 153 of the new manual) to find the option numbers.

In your case, for the RS-232 port at 9600 baud with no parity, DSR/DTR handshaking, 7 data bits, and 1 stop bit, this is the PostScript program:

```
serverdict begin 0 exitserver
statusdict begin 25 9600 36 setsccbatch
```

Download this PostScript program to the LaserWriter IINTX to see if setting the data bits to 7 fixes the problem.

## Lanier WP Systems: File Transfer to/from Macintosh

Revised: 12/18/90  
Security: Everyone

Lanier WP Systems: File Transfer to/from Macintosh

=====

This article last reviewed: 5 November 1990

TOPIC -----

I am looking for a file transfer solution between the Macintosh and a stand-alone Lanier word processing system. Do you have any ideas?

DISCUSSION -----

There are a couple of possible solutions. However, they are really good only for infrequent or one-shot transfers. If you want to consistently transfer the files, there isn't a really good solution like Apple File Exchange translators, because it is unlikely that the Lanier word processor uses a format for its disks that could be read by AFE. The other matter is the format of Lanier word processing files.

The first possibility for transferring the files from the Lanier would be to print the files out of a Lanier serial port directly into a terminal program like MacTerminal running on the Macintosh. This would require that the Lanier has a serial port and can print to that serial port. It would also require that you have the appropriate cable to connect the Macintosh to the Lanier. A drawback to this method is that you lose all of the formatting of the Lanier files.

The second possibility is to use a data conversion service. One that we know of that can work with Lanier and Macintosh formats is Pivar Computing Services. Search the Technical Info library under "Pivar" for details.

## MacTerminal 3.0 Availability and Upgrade Information

Revised: 3/11/94  
Security: Everyone

MacTerminal 3.0 Availability and Upgrade Information

=====

Article Created: 5 November 1990  
Article Reviewed/Updated: 10 March 1994

TOPIC -----

What is the availability of MacTerminal 3.0?

DISCUSSION -----

MacTerminal 3.0 is the current version of MacTerminal, and you should be able to order it through your Apple dealer or a software mail order catalog service.

There is no upgrade path for upgrading earlier versions of MacTerminal to version 3.0. Customers will have to purchase the latest copy of MacTerminal to get the 3.0 version.

## HyperCard 1.2.5: Using find Command To Search Specific Field

Revised: 12/19/90  
Security: Everyone

HyperCard 1.2.5: Using "find" Command To Search Specific Field

=====

Article Created: 5 November 1990  
Article Last Reviewed: 4 June 1992  
Article Last Updated:

TOPIC -----

When I use the find command in HyperCard 1.2.5 to locate a string in a specific field, I get matches in all fields. It works correctly in HyperCard 2.0.

DISCUSSION -----

The HyperCard 1.2.5 "Find" command is documented on pages 106 and 107 of the "HyperCard Script Language Guide: The HyperTalk Language". Using the "Find" command to search on a specific field works only for background fields. If you do a search on a card field, the string will be found in all fields with the text that matches the search criterion.

The find command is more flexible and powerful in HyperCard 2.0.

## MultiFinder: Background Print Monitor Errors

Revised: 1/20/93  
Security: Everyone

MultiFinder: Background Print Monitor Errors

=====

Article Created: 5 November 1990

### Article Change History

-----

- 1/20/93 - UPDATED
- Vendor information.
- 2/02/91 - REVIEWED
- For accuracy.

### TOPIC -----

I have two problems that involve MultiFinder Background Printing. The problems show up on multiple Macintosh computers running Macintosh System Software Version 6.0.5 and LaserWriter Driver Version 6.0.

- 1) After printing a document, the Print Monitor window shows that the print job is "Processing". However, nothing happens (for several hours, if left alone). Only by going into the System Folder and double-clicking Print Monitor will the job finally be released.
- 2) When trying to print a document, a dialogue box comes up and says "Print Monitor found an internal problem, where=6; why=-37." Replacing Print Monitor and reinstalling the system did not correct this situation.

### DISCUSSION -----

These problems are probably related.

- "where=6" is a Print Monitor error: open working directory failed.
- "why=-37" is a System error: dNmErr, a bad name error.

We recommend the workarounds below; do them in the listed order. We advise printing after each step or every couple of steps to see when the problem is

eliminated.

- 1) Throw away the Spool Folder (a new one will be created automatically next time you use Print Monitor).
- 2) Repair the volume with Disk First Aid.
- 3) Repair the volume with Norton Utilities from Peter Norton Computing, (acquired by Symantec Corp and/or SUM Tools from Symantec, or perhaps PC Tools/Macintosh from Central Point Software. (For address and phone information, search the Tech Info Library under the company names.)
- 4) Check for and eliminate any viruses.
- 5) If none of the above works, backup any information you wish to save and then reformat the drive.

## Using MacX under Macintosh OS With DECwindows on VAX (1/95)

Revised: 1/30/95  
Security: Everyone

Using MacX under Macintosh OS With DECwindows on VAX (1/95)

Article Created: 6 January 1991  
Article Reviewed/Updated: 30 January 1995

TOPIC -----

To use DECwindows clients using MacX under the Macintosh OS, what files need to be on the VAX and what files need to be on the Macintosh?

DISCUSSION -----

On the Macintosh side, for the MacX server to work properly, the Macintosh should be installed and configured with MacX, MacTCP, and CommToolbox. You should have the MacTCP tool in the Communication Folder within the System Folder. On the VAX site, if the DECwindows client is running under VMS, you need to get the "PATHWORKS for Macintosh" software from DEC, which includes some fonts and communications tools for both Macintosh OS and VAX/VMS. If the VAX is running under Ultrix or UNIX, no special files are needed, because TCP/IP transport is usually supported in UNIX OS.

Note: The READ ME file that comes with the MacX lists a few known problems/reasons/solutions for MacX and X11 client applications and troubleshooting tips.

## A/UX: POP (Post Office Protocol) Information (9/94)

Revised: 9/13/94  
Security: Everyone

A/UX: POP (Post Office Protocol) Information (9/94)

Article Created: 19 December 1990  
Article Reviewed/Updated: 12 September 1994

TOPIC -----

I want to use TCP/Connect II with smtp and A/UX. It needs software called POP. Do you have this software? What are its functions? Is it standard on other UNIX systems?

DISCUSSION -----

There are three versions of POP (Post Office Protocol): POP, POP2, and POP3. The detailed specification of POP is described in RFC 918 (obsolete), RFC 937, RFC 1081, and RFC 1082.

Basically, the intent of the original Post Office Protocol (POP) was to let a user's workstation access mail from a mailbox server. It uses the Simple Mail Transfer Protocol (SMTP) to post mail from the workstation to the mailbox server. The POP protocol is dependent on TCP (Transmission Control Protocol). Below is the POP protocol:

The server is listening for a connection with the protocol. When a connection is opened, the server sends a greeting message and waits for commands. When commands are received, the server acts on them and responds with replies.

The client opens a connection, waits for the greeting, then sends the USER and then the PASS commands to establish authorization to access mailboxes. The client begins a mail reading transaction with either an RDEL (to read and delete all messages from a mailbox) or a RETR (to simply read all messages from a mailbox). The server opens and locks the mailbox and responds with the number of characters in the mailbox. Then, the client asks for the data to be sent by issuing the RCEV command. The server responds by sending the mail data.

When all the data has been received, the client sends the RCVD command. If the transaction started with the RDEL command, the server now deletes the mail data from the mailbox. In any case, the server closes and unlocks the mailbox. The client terminates the session with the QUIT command. POP2 is designed for an

environment of workstations and servers on a low-delay, high-throughput, local networks (like Ethernets). The POP2 server is listening on TCP port 109.

POP3 lets a workstation dynamically access a maildrop on a server host. Usually, this means the POP3 is the means a workstation (client) uses to retrieve mail from the server. The POP3 server listens on TCP port 110.

Any UNIX system (like A/UX) that supports TCP can implement a POP server. There is public domain POP server software available from UC Berkeley at the following Internet address (via ftp "anonymous" and any password):

## AppleTalk for VMS 2.0.6 Fixes Error Message Problems

Revised: 2/1/91  
Security: Everyone

AppleTalk for VMS 2.0.6 Fixes Error Message Problems

=====

This article last reviewed: 14 January 1991

TOPIC -----

I get error messages (one every 10 secs.) generated on the VAX/VMS coming from AppleTalk. I am using AppleTalk for VMS 2.0 on one machine and AppleTalk for VMS 2.0.5 on another one. Is this allowed? The error messages are related to the exchange of RTMP packets. The errors are on the operator.log files or via the reply/enable command. This is the error message:

```
%ATK-W-INVPACREC, Invalid packet received  
DETECTED IN ROUTINE RTMPSktListener 1
```

DISCUSSION -----

One of the major changes between AppleTalk for VMS 2.0 and 2.0.5 is that the definition of an invalid packet was changed to exclude a large number of packets that had previously been accepted as valid. This was done because a number of the packets that were previously being accepted were actually very badly-formed packets and were causing the bridge process to crash.

However, things were tightened up so much that packets that valid were rejected. Version 2.0.6 resolves this, and you should get it from the same source from which you got version 2.0.5.

Using version 2.0.6 may resolve your problems. It is also possible that there are bad RTMP packets being generated on the network. In this case, you will continue to receive the warning messages. The ATKBRIDGE.LOG file will contain the actual packets that are being rejected, and you can often identify the sender from the data in this log file.

Either way, you should be using the latest version (2.0.6) on both VAX systems. Version 2.0 has a large number of problems, so the machine running that version should be upgraded.

Finally, if at all possible, you should move everything to AppleTalk Phase 2 and PATHWORKS (formerly LanWORKS). That is the direction we are headed, and you should use AppleTalk for VMS 2.0.6 and 2.1 only as interim releases, until you are ready to install PATHWORKS.

## LaserWriter: Toner Cartridge Guidelines (2/95)

Revised: 2/21/95  
Security: Everyone

LaserWriter: Toner Cartridge Guidelines (2/95)

Article Created: 19 November 1990  
Article Reviewed/Updated: 21 February 1995

TOPIC -----

Does Apple publish guidelines concerning remanufacturing of toner cartridges?

DISCUSSION -----

Apple recommends using remanufactured or reconditioned instead of refilled toner cartridges.

### Refilled Cartridges =====

Refilled cartridges are merely refilled with toner, usually of a different kind than the original equipment manufacturer toner. The parts inside are not touched. Refilled cartridges may include worn parts, which do not yield the high level of print quality expected of laser printers. In addition, the printer warranty may be void if the printer is damaged due to the use of poor-quality recycled toner cartridges.

### Remanufactured Cartridges =====

Reconditioned or remanufactured cartridges, on the other hand, can be used safely if certain steps are taken in the remanufacturing process. There is the added advantage that these cartridges get recycled, reducing the amount of solid waste that goes into landfills. The minimum recommended guidelines for remanufactured toner cartridges are:

Photo-Conductive Image Drum Inspection/Replacement

-----  
Inspection, and, if necessary, replacement of the photo-conductive image drum.

This is probably the most important part in the cartridge. It is the one most likely to suffer from abrasion and scratches after normal use. A damaged photo drum does not yield good print quality.

#### Urethane Wiper Blade Inspection/Replacement

---

Inspection, and, if necessary, replacement of the urethane wiper blade on the photo drum. This part scrapes toner from the drum. It is subject to heat degradation over time, making it hard and brittle and more likely to damage the photo drum.

#### Internal Parts Cleaning and Inspection

---

Cleaning and inspection of internal parts. There are many small plastic parts, including gears and springs, that should be inspected and cleaned in the remanufacturing process to ensure that they are not faulty.

#### Toner Powder Quality

---

Use of good-quality toner powder.

Apple cannot endorse or certify the products of recycled toner cartridge vendors, because we cannot maintain a program of regular testing of their products to ensure consistent quality control.

## Mouse Compatibility: Macintosh Plus and Apple II Computers

Revised: 7/27/92  
Security: Everyone

Mouse Compatibility: Macintosh Plus and Apple II Computers

=====

Article Created: 19 November 1990  
Article Last Reviewed: 27 July 1992  
Article Last Updated:

TOPIC -----

My official Apple mouse works on my Macintosh Plus, but not on my Apple II computer. What does this mean?

DISCUSSION -----

There are two vendors for the mouse that works with the Macintosh Plus and Apple II line. If you switch mice between systems, the mouse may not work.

One vendor's mouse works with both lines, and the other works only with the Macintosh Plus:

- The mouse identified as "Made in the US" works on both computers.
- The other is identified as "Made in Japan".

All service stock is of the compatible version (P/N 661-0400).

## IINTX w/Rev 3 ROMs: Format HD w/LW Font Utility 2.0.2

Revised: 4/1/94  
Security: Everyone

IINTX w/Rev 3 ROMs: Format HD w/LW Font Utility 2.0.2

=====

This article last reviewed: 19 November 1990

TOPIC -----

I recently upgraded my LaserWriter IINTX logic board with revision 3 ROMs. The third-party fonts cause initialization errors when printing. However, if I move the same external hard disk to a non-upgraded LaserWriter IINTX, these fonts print just fine. Where's the problem?

DISCUSSION -----

The LaserWriter IINTX with Rev 3 ROMs does not work properly with a hard disk formatted with the LaserWriter Font Utility 1.x. You need to reformat the disk and copy the fonts back onto the hard disk using the LaserWriter Font Utility 2.0.2. There is no way to make this procedure easier.

## Macintosh Portable: TCP/Connect & NCSA Telnet Compatibility

Revised: 1/10/91  
Security: Everyone

Macintosh Portable: TCP/Connect & NCSA Telnet Compatibility

=====

This article last reviewed: 20 November 1990

TOPIC -----

I recently read that versions of NCSA Telnet, including NCSA Telnet 2.3 and the current version of TCP/Connect, do not work with the Macintosh Portable.

Is this a MacTCP (driver) problem or is it purely application-based? Should TCP/Connect II offer a solution?

DISCUSSION -----

The incompatibility is with the applications, not with MacTCP. InterCon told us that the latest version of TCP/Connect (version 1.0.1) does work properly with the Macintosh Portable. As of November, NCSA was preparing version 2.4 of NCSA Telnet. Version 2.4 will work with the Macintosh Portable. For more information, please contact: NCSA and InterCon Corp. Both are listed in the Technical Info library.

## Macintosh SE 2/40 Upgrade: SIMM Requirements

Revised: 1/10/91  
Security: Everyone

Macintosh SE 2/40 Upgrade: SIMM Requirements

=====

This article last reviewed: 20 November 1990

TOPIC -----

To upgrade a Macintosh SE 2/40, do the two additional 1MB SIMMs need to be the same speed as the original 2MB SIMMs?

If so, is there any way to determine the speed of the installed RAM without opening the Macintosh SE case?

DISCUSSION -----

The Macintosh SE 2/40 requires SIMMs that are 150ns or faster. If the SIMMs already in the Macintosh SE are 120ns, you can add two more that are 150ns. The important thing is that the SIMMs in each group (group A is SIMM slot 1 and 2; group B is SIMM slot 3 and 4) must be the same speed.

The only way to tell the speed of the RAM installed is to look at the RAM chips themselves. Typically the 120ns RAM chips will have a "12" printed on them and the 150ns RAM chips will have a "15".

## Serial NuBus Card: Pinout Information (7/93)

Revised: 7/12/93  
Security: Everyone

Serial NuBus Card: Pinout Information (7/93)

Article Created: 20 November 1990

### Article Change History

07/21/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I need pin-out information for the Serial NuBus (NB) Card.

### DISCUSSION -----

Here are Apple Serial NB Card D-62 Connector Pinouts. There are two types of cables, the Hydra cable with four RS-232-C connectors, and the V.35 cable with one RS-232-C connector and one V.35 connector.

The term "RS-232" as used here refers to a signal that is single-ended and driven between +/-12V.

The terms "RS-422" and "X.21" as used here refer to a signal that is differential and driven +/-, measured differentially.

| Pin # | Signal     | Function                                                    |
|-------|------------|-------------------------------------------------------------|
| ----- | -----      | -----                                                       |
| 1     | +CA1F      | X.21 Control, +CHA1, OUTPUT                                 |
| 3     | -CA1F      | X.21 Control, -CHA1, OUTPUT                                 |

## Serial NB Card: Custom versus Extender Cable

Revised: 7/16/92  
Security: Everyone

Serial NB Card: Custom versus Extender Cable

=====

Article Created: 20 November 1990  
Article Last Reviewed: 10 June 1992  
Article Last Updated:

TOPIC -----

I am using MacX25 and a Serial NB card. The synchronous modem is located in a different room from the Macintosh, about 10 meters away. Is it possible to get a connecting cable? What is the maximum length we can reach with RS-232 cable between Macintosh and modem?

If this cable doesn't exist yet, we need specifications to build such cable with a J-62 on one side and one RS-232-C on the other.

DISCUSSION -----

We recommend contacting a cable distributor like Black Box and ordering one of their straight-through extender cables. This is far less expensive than having a custom "62-25"-pin cable built. It is also a faster solution, as this cable is fairly common and available in a variety of lengths. Request a cable with all pins attached, with one male and one female connector. You might want to describe the cable length (10 meters plus 3 feet, the length of the "Hydra" cable, which is within RS-232-C specification of 50 feet), and the data rates you intend to use.

For more details, search the Technical Info library under "Black Box".

A/UX and SGML (Standard Generalized Makeup Language)

=====

Article Created: 10 January 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Is there a version of SGML (Standard Generalized Makeup Language) for A/UX 2.0?

### DISCUSSION -----

We don't know if SGML runs under A/UX. However, SoftQuad, Inc. does have some software products related to SGML for the Macintosh OS. Their products include:

- SoftQuad RulesBuilder is an Interactive editor for creating SGML DTDs (Document Type Definitions), which, when compiled, also acts as a SoftQuad Author/Editor rules files.
- SoftQuad Author/Editor CALS is a text entry system that provides easy access to the power of structured editing based on SGML, the U.S Government's publishing standard for the Computer-Aided Acquisition and Logistics Support Initiative (CALS).
- SoftQuad Author/Editor is a context-sensitive text entry system that meets the requirements of the Standard Generalized Markup Language (SGML).

For more details, search the Technical Info library under "SoftQuad."

## Apple IIGS: DOS 3.3 and Hard Drives

Revised: 1/10/91  
Security: Everyone

Apple IIGS: DOS 3.3 and Hard Drives

=====

This article last reviewed: 20 November 1990

TOPIC -----

Is it possible to partition the hard drive of a Apple IIGS, so one partition contains DOS 3.3 and applications and the other contains GS/OS? I tried it, and now the IIGS can't recognize DOS 3.3 floppy disks.

DISCUSSION -----

DOS 3.3 was created when hard disk drives were only a dream for microcomputers. Thus, DOS 3.3 and previous versions understand only the 140K 5.25-inch disks. DOS 3.3 does not understand the 3.5-inch disk and hard-disk environments. When hard disks did appear for the Apple II family and DOS 3.3 was still the operating system of choice, individual hard-drive manufacturers devised independent schemes for dividing their products into multiple 140K volumes so DOS 3.3 could work with the hard drives. ProDOS was created to overcome the limits that DOS 3.3 imposed on storage volumes.

GS/OS would require a File System Translator (FST) to recognize the 5.25-inch disks of the DOS 3.3 operating system. However, the FST would be of no assistance in providing DOS 3.3 partitions on a hard disk, because the lack of hard-disk support is a limitation of DOS 3.3 itself, not the FST. To use DOS 3.3 applications on an Apple IIGS requires restarting from a 5.25-inch DOS 3.3 disk.

## A/UX: Moniterm Monitor Compatibility Issue

Revised: 11/10/92  
Security: Everyone

A/UX: Moniterm Monitor Compatibility Issue

Article Created: 10 January 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

My group just received ten copies of A/UX 2.0 and ten Macintosh IIci systems. We are using Moniterm 21-inch color monitors. The Macintosh OS boots fine. When the system switches to A/UX, the monitor goes blank during the boot process. Is this a known Moniterm problem? Is there a workaround? Tech support at Moniterm didn't have a clue what A/UX was and had never heard of a problem.

### DISCUSSION -----

Typically, third-party video cards have had incompatibilities with A/UX. This goes back to A/UX 1.0. The manufacturers of the cards have had to release new ROMs to get their video cards (and therefore displays) to function properly with A/UX. SuperMac, RasterOps, and other manufacturers have done this.

Because there is no software workaround possibility, the burden of compatibility with the A/UX video drivers rests with the hardware manufacturer.

We will contact Moniterm's tech support and bring the issue up with them again. We suggest that the customer do the same if they want to use these monitors with A/UX 2.0. There may not be too much hope of a solution, if they are not even aware of A/UX. Furthermore, it would be unlikely that there would be a quick solution since ROM upgrades typically take a while.

The other route would be to try similar video cards and monitors from a third-party company that supports A/UX, and this may be the only solution

depending on Moniterm's response.

## Using British Keyboard on U.S. Macintosh

Revised: 7/2/92  
Security: Everyone

Using British Keyboard on U.S. Macintosh

=====

Article Created: 26 November 1990  
Article Last Reviewed: 26 June 1992  
Article Last Updated:

TOPIC -----

Can I use my British keyboard with an American Macintosh?

DISCUSSION -----

There are a couple of ways to use the Apple Desktop Bus British keyboard with a United States system. Both involve modifying the System Software running on the Macintosh.

The first method is to install the British System software on the Macintosh. This makes all of the necessary resources available, so you can use the machine exactly as you would in the UK.

The second method is to take the necessary resources from a British System Tools disk and install them in the System file on the Macintosh in question. If all you want is to map your keyboard properly, then you need the British 'KCHR' resource. You can use ResEdit to transfer a copy of this resource from the British System to the System file on the Macintosh. Once you've done this, choose the British keyboard mapping through the use of the Keyboard CDEV in the Control Panel.

If you want British sorting as well as British numerical and date formats, then you must copy all the British "itlX" resources too, where the "X" includes b,k,1,2,3,4. At this point, you would probably do better installing the British software, because the international software typically includes keyboard mapping for US keyboards, too.

Either way, the keyboard will function properly with a Macintosh manufactured in the United States.

## HyperCard 2.0: Compatibility with Earlier XCMDs and XFCNs

Revised: 1/15/91  
Security: Everyone

HyperCard 2.0: Compatibility with Earlier XCMDs and XFCNs

=====

This article last reviewed: 26 November 1990

TOPIC -----

Is there a list of XCMDs and XFCNs that are known to work with HyperCard 2.0? I am converting a mission-critical application from HyperCard 1.2.5 to HyperCard 2.0. The application uses a lot of WindowIt XCMDs and MitemView.

DISCUSSION -----

As of October, 1990, there was no published list of external routines compatible with HyperCard 2.0. Because the list of available routines changes every day, we doubt that there will ever be such a list. Testing results have shown that better than 80 percent of the tested externals work fine with HyperCard 2.0. We know this is not the answer you're looking for, but it's all we have.

For information on specific XCMDs and XFCNs, we suggest you contact the developer directly.

WindowIt, originally from Third Wave Computing and then Heizer Software has been returned to the original developer. As far as we know, it will not be modified to support HyperCard 2.0.

## Shared Access to Rdb Database under DAL

Revised: 7/21/92  
Security: Everyone

Shared Access to Rdb Database under DAL

=====

Article Created: 15 January 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

I am having a problem with shared access to an Rdb database under DAL. Here are commands from the VMS \$ prompt and their results:

```
$ icl1
Network Innovations Interactive CL/1 Demo
Execution begins...
  CL/1 version 1.11
Execution Completed Successfully

begin> OPEN RDB DBMS ;
more>  USE LOCATION "CL1$SYSTEM" ;
more>  OPEN RDB DATABASE "CL1DEMO" FOR SHARED READONLY ;
more>  GO
begin> SELECT * FROM OFFICES; PRINTALL ;
more>  GO
.
.
.
data from above database displayed
.
.
.
```

Meanwhile, from another process (once the above user has attached to the database and started a transaction), the following command:

```
$ RMU/DUMP/USERS CL1$SYSTEM:CL1DEMO
```

shows that the above DAL commands produced a read/write transaction on the RDB

database. From all the tests I have done, no read-only transaction is possible on an Rdb database using DAL.

DISCUSSION -----

The symptom you described is one of the restrictions and limitations with DAL and Rdb. Basically, DAL provides protection using a model based on databases and tables, while Rdb uses a model based on protection. We checked with Network Innovations, and they have provided the DAL 1.2 Technical Notes, in which item #10 describes the restrictions and limitations with DAL and Rdb. The following is the text for that note.

----

DAL Technical Note # 010  
Data Access Language (DAL) and Rdb

This tech note discusses restrictions and limitations with DAL and Rdb.

The Rdb DBMS adapter for the DAL Server is best viewed as a VAX/VMS C application which uses Rdb's Dynamic SQL interface to access Rdb databases. Accordingly, any DAL user who intends to access Rdb databases should ensure that his or her account is set up with the proper VMS privileges and quotas required by Rdb. DAL users should also note that any current restrictions or problems in Digital's Rdb and Dynamic SQL will also affect the DAL Rdb DBMS adapter.

For example, when Rdb performs arithmetic operations on floating point data types such as the SQL aggregate function AVG(), Rdb rounds any decimal result to a whole number. Consequently, DAL client queries containing aggregate functions on decimal or float datatypes will return rounded numbers when executed in Rdb.

Listed below are some specific Rdb related problems and their workarounds or explanations:

- Problem #1: Referring to multiple databases by dbaliasname (AuthID)

To support multiple Rdb databases, the DAL Server Rdb Database Adapter uses the DECLARE SCHEMA statement in Rdb's Dynamic SQL for each database opened. In Rdb, each database or schema is referenced by an "authorization identifier" or AuthID. DAL uses the dbaliasname specified in an OPEN DATABASE statement as the AuthID. (Or when a dbaliasname is not specified, the database name is used as the alias and AuthID by default). For example:

| dbaliasname | AuthID |
|-------------|--------|
|-------------|--------|

- |                                              |        |        |
|----------------------------------------------|--------|--------|
| - open database "sample";                    | sample | sample |
| - open database "reservations" alias "test"; | test   | test   |

Normally, the DAL Server keeps track of the AuthID for you. However, if you mix normal DAL statements with Rdb statements (via the DAL EXECUTE IMMEDIATE statement), you may need to use the AuthID when referring to tables, views, and indexes or when using the Rdb SET TRANSACTION statement. When referring to

tables by the dbaliasname in DAL, the correct syntax is:

```
dbaliasname!table_name           sample!offices
```

Rdb uses a period "." instead of an exclamation point "!" when referencing a table by the schema's AuthID:

```
AuthID.table_name                sample.offices
```

(Note: DAL uses the period "." to prepend an owner name to a table. For example, sample!mark.offices in DAL indicates the table offices owned by mark in the database whose dbaliasname is sample.)

So, when using DAL's EXECUTE IMMEDIATE statement to set a transaction mode for a database or to reference a table, be sure to use the database's dbaliasname as the AuthID. For example:

```
open rdb dbms;
open rdb database "daldemo" alias test in location "msad$system";
execute immediate "create table small (text char(20))";
commit;
insert into test!small values ("xyz");
execute immediate "update small set text = 'small fails' where text = 'xyz' ";
rollback;
insert into test!small values ("xyz");
execute immediate "update test.small set text = 'test.small works' where text = 'xyz' ";
commit;
```

## - Problem #2: Table Locking with DAL and Rdb

DAL provides a model for specifying the type of "protection" or "locking" desired when using a database or specific table. Both the OPEN DATABASE and OPEN TABLE statements allow for update modes (READONLY/UPDATE) and sharing modes (SHARED/PROTECTED/EXCLUSIVE). The default mode is UPDATE and PROTECTED. Typically this would mean that the user has a "READ/WRITE" lock on the particular table or database. The sharing and update modes are advisory and are passed on to the DBMS only WHEN APPROPRIATE.

Rdb provides a some what different model for specifying protections that does not map well with the DAL model. Rdb uses an extension to SQL transactions – the SET TRANSACTION statement – to signal the type of locking mechanism desired for that transaction. SET TRANSACTION modes are not persistent across subsequent transactions; they must be specified at the beginning of each new transaction or the default mode of "READ WRITE" and "SHARED" will be used.

DAL update and shared modes are not transaction based; that is, in the DAL model, update and shared modes are "global" session modes and are independent of beginning and committing sessions. Consequently, when a DAL user opens a Rdb database or table, specifying a particular update or shared mode, the Rdb transaction modes are NOT changed. The DAL Server does not alter the Rdb transaction modes because they CANNOT be changed in the middle of a Rdb transaction. One would have to commit the current transaction and begin a new

transaction, setting the transaction modes as desired.

There are two possible problems:

1) PROBLEM: Lock Conflicts caused inserts and updates while using the Rdb default transaction modes.

SOLUTION: Commit as early and often as possible. Generic DAL applications should commit often to free any locks against tables and indexes accessed. Otherwise, other users might be locked out of one or more tables.

2) PROBLEM: User wants to specify READ ONLY to prevent locking.

SOLUTION: Applications tailored to Rdb can explicitly begin new transactions with the desired locking and update modes by using the Rdb SET TRANSACTION statement via the DAL EXECUTE IMMEDIATE statement. Below are examples:

```
open rdb dbms;
open rdb database "daldemo";
execute immediate "SET TRANSACTION READ ONLY;" in Rdb;
...queries....
commit;          /* ends this transaction with READ ONLY */
insert into ....
commit;
```

- Problem #3: Attempting to query directly against the Rdb System Relations occasionally fails. For example, the following query fails:

```
SELECT RDB$RELATION_NAME FROM RDB$RELATIONS;
```

Explanation: When DAL is asked to do a query, it checks the syntax and content of the query statement to ensure that the columns and tables asked for exist in the database and to determine the data types of the results. Certain system relations contain columns with a "SEGMENTED STRING" data type (seg\_str). This data type is not supported in SQL interface for Rdb 3.xxx (but will be supported in Rdb 4.0). Even though the column queried is not of the type seg\_str, DAL looks at the entire structure (column names, data types, and lengths) to check for correct syntax and content. And in doing so, Rdb generates the following error code when it encounters a column with a seg\_str: SQL-F-INVSSCONV, Invalid conversion for segmented string column RDB\$VIEW\_BLR.

WORKAROUND: Use the execute statement to create a view that specifies the non-seg\_str columns desired. Then use DAL to query the view. This way, the DAL server's table look-up won't stumble on columns with the data type seg\_str. The following example does this:

```
Execute immediate "create view temp as
  select rdb$relation_name from rdb$relations";
commit ;          /* don't forget to commit */
Select rdb$relation_name from temp;
```

Macintosh: Connecting to LAN-Based SQL Servers

=====

Article Created: 26 November 1990  
Article Last Reviewed: 11 August 1992  
Article Last Updated:

TOPIC -----

I am implementing LAN-based SQL servers and would like to connect a Macintosh into that environment. I am looking at three products to run on an OS2/LAN Manager machine: Sybase, SQL Server, and Gupta. What can you tell me about connecting a Macintosh into these products?

DISCUSSION -----

Sybase confirmed that a Macintosh can access SQL Server, if you have the DB Library and HyperDB Library for the Macintosh. These libraries are extra and not part of the basic SQL Server product. Connections are TCP/IP over Ethernet.

SQL Server is the name of the Database Server by Microsoft-Sybase. The Server runs on OS/2, and uses Named Pipes as the network protocol. Named Pipes is a network extension to OS/2--Microsoft's answer for interprocess communications on DOS or OS/2 PC LANs.

Gupta Technologies' SQL Base servers run on either DOS or OS/2, and uses NetBIOS as the network protocol. Gupta told us that there is no way to connect a Macintosh to SQL BASE.

## A/UX 2.0.1: tunefs Patch on A/UX Info and Update Server

Revised: 9/29/92  
Security: Everyone

A/UX 2.0.1: "tunefs" Patch on A/UX Info and Update Server

=====

Article Created: 26 November 1990

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I am trying to maximize free space on my A/UX root file system with tunefs, but the changes do not stay in effect as they should after re-booting.

I enter

```
tunefs -m 0 -o space /dev/dsk/c0d0s0
```

Then, I can check and see the new values with

```
tunefs -p /dev/dsk/c0d0s0
```

Any suggestions?

### DISCUSSION -----

You have found a known problem with tunefs(1). We have a patch for the program available on the A/UX patch server ([aux.support.apple.com](http://aux.support.apple.com)) which can be downloaded via the Internet using anonymous ftp or by dialing into one of the V.32 Telebit modems and transferring the patch via Kermit, XModem, or the like.

The A/UX Information and Update server can be reached at 408-559-3066, login aux, or via the Internet at 130.43.6.2 ([aux.support.apple.com](http://aux.support.apple.com)), login ftp.

## Router Security Features

Revised: 1/15/91  
Security: Everyone

Router Security Features

=====

This article last reviewed: 26 November 1990

TOPIC -----

My company is having problems with our Ethernet backbone. Everyone is on the Ethernet, but one division controls all access to the net.

People from different divisions can see into the corporate office's zone and services. They can also print on corporate's LaserWriters. The corporate office wants to block transmission into their area but let everyone in the corporate office see services outside of their area. The corporate office needs access to the IBM hosts and VAX systems which are all on the backbone but in different divisions. Thus, total isolation is out of the question.

Right now, we connect our local divisions together with VitaLink boxes and T1 lines. I thought the VitaLink could do some of the above. But, even if they could, the one division controls them. The best solution for corporate is to find a router/bridge that has the above blocking/filtering features. If this is not possible, is there a device that at least allows controlled access to LaserWriters?

DISCUSSION -----

There are several options available to allow zone and device hiding, but most of these products are LocalTalk to Ethernet routers like the Shiva FastPath or the Cayman GatorBox. There is one product that may provide the type of security you require; the NRC Macintosh-based Multigate router provides Ethernet-to-Ethernet routing and provides the ability to define parts of your network as insecure.

See the explanation below for a complete description of the options available for each device. Here is a summary of AppleTalk router security features:

LOCALTALK TO ETHERNET ROUTERS  
-----

Cayman Systems GatorBox

-----

#### Zone Filtering:

Zone filtering prevents users in the filtered zone from seeing other zones on the network to which they are connected. This also prevents users in zones outside of the filtered zone from seeing devices in the filtered zone.

#### Laser Filtering:

Laser filtering is, in a sense, a subset of zone filtering. Where the zone filtering shields all of the devices from the outside, laser filtering lets you hide just the LaserWriters from anyone outside of its AppleTalk zone. This also prevents users in the filtered zone from seeing LaserWriters in other zones.

#### Tilde Filtering:

Tilde filtering lets you hide any device with a tilde character at the end of its name, so that it cannot be seen by anyone outside of its zone.

#### Shiva FastPath

-----

#### Stay in Zone:

The stay-in-zone option prevents users in the filtered zone from seeing other zones on the network to which they are connected. This also prevents users in zones outside of the filtered zone from seeing devices in the filtered zone.

#### LaserWriter Security:

LaserWriter security is, in a sense, a subset of zone filtering. Where the zone filtering shields all of the devices from the outside, laser filtering lets you hide just the LaserWriters from anyone outside of its AppleTalk zone. This also prevents users in the filtered zone from seeing LaserWriters in other zones.

#### Tilde Security:

Tilde filtering lets you hide any device with a tilde character at the end of its name, so that it cannot be seen by anyone outside of its zone.

#### NRC 2000

-----

#### Insecure:

The insecure option lets you define sections of your Internet as "insecure." An insecure network's routing information is not propagated to any other section of the network, thus providing a way to control who can access the secure sections of the Internet.

#### APT

---

APT has announced an update to their AppleTalk routers. They now support device security across zones. Users can, for example, hide their LaserWriter from anyone not in their zone. You can also hide other devices, like file servers and NetModems.

The user can let other users on different zones and create different sets of

access to different devices. For example, Zone A may have no access to your LaserWriter, but still have access to a File Server, while Zone B has access to all LaserWriters, but not AppleTalk ImageWriters or NetModems.

APT routers connect multiple LocalTalk, Ethernet, WAN, and Serial networks together, and supports Phase II AppleTalk. DDP/IP encapsulation is in the works.

#### ETHERNET TO ETHERNET ROUTERS

##### ----- NRC Multigate Macintosh -----

##### Insecure:

The insecure option lets you define sections of your Internet as "insecure." An insecure network's routing information is not propagated to any other section of the network, thus providing a way to control who can access the secure sections of the Internet.

##### Cisco (CGS/MB/AGS) -----

The cisco router offers the ability to set up access lists that permit controlled access to your network. Access lists are set up to filter all in-bound network traffic from any network listed in the access list. Only traffic from networks not listed in the access lists is permitted into your network. Traffic from your network is still propagated to all other segments of your Internet.

## HyperCard 2.0 Tour: forward Handler Bug and Workaround

Revised: 1/18/91  
Security: Everyone

HyperCard 2.0 Tour: "forward" Handler Bug and Workaround

=====

This article last reviewed: 26 November 1990

TOPIC -----

I cannot navigate through the whole HyperCard 2.0 Tour stack. When I get to card 56 of the tour, I cannot use the button for card movement forward. All other buttons function properly. The same thing happens if you are on card 58 and try to go back a card to the previous card.

DISCUSSION -----

Clicking on the "Next" button or pressing the right-arrow key on card 56 calls a handler named "forward". "Forward" calls a SysEnvirons XFCN and bases its choice of which card to go to on the value returned.

The XFCN is aware of all released Apple keyboards. However, the only options for the version of the stack we have are "Macintosh Plus Keyboard", "Standard ADB Keyboard" (includes the Apple IIGS Keyboard), and "Apple Extended Keyboard" (includes both domestic versions). You will encounter problems if you use any keyboard not listed above.

We don't know whether the tour stack will be localized to correct this problem. As a workaround, you can replace the existing "forward" handler with the one below.

```
on forward
  hide message box
  put SysEnv() into mySys

  visual effect wipe left
  if item 6 of mySys = "Macintosh Plus Keyboard"
  or item 6 of mySys = "Standard ADB Keyboard"
  or item 6 of mySys = "Apple Extended Keyboard"
  then
    go card item 6 of mySys
```

```
    else
      go card "Apple Extended Keyboard"
    end if
  end forward
```

Before modifying the script, you must set `userLevel` to 5 to do scripting.

## Macintosh SE/30 Versus Macintosh IIfx: Video Speed

Revised: 6/18/92  
Security: Everyone

Macintosh SE/30 Versus Macintosh IIfx: Video Speed

=====

Article Created: 18 January 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated:

TOPIC -----

I have written code in Lightspeed C that makes many QuickDraw calls. When I run it on my Macintosh SE/30 with an external 19-inch mono monitor attached to a video card in the PDS, I notice that it runs significantly faster than when I run the same program on my Macintosh IIfx with either the Apple 4•8 card and the Apple 21-inch mono or an emachines 19-inch monitor also in black and white mode.

Is this because the PDS slot is faster than the NuBus slots or are there other factors? It seems that the 40 MHz Macintosh IIfx should be faster than the 16MHz Macintosh SE/30.

DISCUSSION -----

Your assumption is correct. The Macintosh SE/30 PDS (processor direct slot) runs at 16MHz, while NuBus slots are limited to 10MHz. The increased bandwidth available to the PDS due to the 60 percent greater clock lets much more data pass than is possible with NuBus. NuBus overhead and arbitration widens this speed difference.

While the Macintosh IIfx itself runs much faster than the Macintosh SE/30, it cannot move data to the video RAM as quickly, because of this bus limitation. Programs which are calculation-intensive run much faster on the Macintosh IIfx, whereas programs that perform high-speed graphical operations can display faster on the Macintosh SE/30. The deciding factor is a matter of how many bits are being pushed across the bus to video RAM.

The current Macintosh II family shares the 10MHz NuBus speed. To alleviate this shortcoming caused by NuBus compatibility requirements, the Macintosh IIfx has its own PDS that is even faster than the Macintosh SE/30 PDS. It runs at

the full speed of the Macintosh IIfx I/O bus, which is 20MHz, and is, therefore, capable of twice the bandwidth of NuBus, and 25 percent more than the Macintosh SE/30 PDS.

Unfortunately, we do not yet know of any compatible video cards. Although the Macintosh IIfx PDS looks similar to the Macintosh SE/30 PDS, the two slots are not at all compatible. We do not know of any cards in development and wouldn't think that this would be in any company's priorities. Macintosh graphics acceleration is tending toward specialized, dedicated graphics processors, like our 8/24GC card, that are NuBus cards and compatible across the Macintosh II family.

If you require faster video than the Macintosh IIfx can provide, your best alternative is to evaluate graphics accelerator cards. Two sources for such cards are Radius and SuperMac Technology. The Apple 8•24GC card is another option.

## Connecting to ABANET via Telenet

Revised: 4/18/91  
Security: Everyone

Connecting to ABANET via Telenet

=====

This article last reviewed: 27 November 1990

TOPIC -----

I need to connect to ABANET. According to the information I received from ABANET they can be reached through Telenet. How can I reach ABANET via Telenet. I have a connection to the Belgian DCS network (Packet network, X.25).

DISCUSSION -----

It sounds like ABANET has subscribed with Telenet, a X.25 Public Data Network provider, to get access to the X.25 PDN via Telenet. As a subscriber on a PDN, ABANET would have been given a unique address, not unlike your telephone number, that could be broken down into the world zone, country zone, a network digit and network terminal number.

Therefore, to reach ABANET from another X.25 PAD, like MacX25, you just need their address. From MacX25 you enter that address in the "Host Address" or "Called Address" field. Then, open the connection via a terminal communication tool (MacTerminal 3.0, White Pines Mac241, or the like). Their address will be understood by your local PDN provider's packet-switching equipment and your call request will be routed through whatever PDN networks are required to reach ABANET.

## AppleShare: Processors, RAM, and User Limits

Revised: 1/18/91  
Security: Everyone

AppleShare: Processors, RAM, and User Limits

=====

This article last reviewed: 27 November 1990

TOPIC -----

I understand that AppleShare is limited to 50 concurrent users in its current version, but what is the technical reason behind this seemingly arbitrary limit? I've heard something having to do with the number of sockets allowed per node and that each AppleShare user requires the use of two socket addresses? Can you explain?

DISCUSSION -----

The AppleShare concurrent user limit is hard-coded, based on performance assumptions made about the number of users a given type of server could support. Depending on what type of Macintosh you have and its quantity of RAM, a certain amount of memory is allocated to support that number of users.

A 68000- or 68020-based server with 1MB of RAM supports up to 25 users -- but a 68020 or "higher" CPU with 2MB or more of RAM lets AppleShare support up to 50 users.

A/UX 2.0: "In -f" Problem (8/94)

=====  
Article Created: 27 November 1990  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

I have a problem with the `ln -f` command. Logged in as root in console mode, I created a directory `/usr/users`, did an `ln -f /usr /usr/users`, and got a Kernel bus error, `!Double panic: kernel memory management error`, some hex addresses and a crashed file system. I was unable to recover, but a friend's system was okay after restarting and doing an `fsck` from A/UX Startup.

DISCUSSION -----

We have verified the problem. The `'ln -f'` is buggy and has also been found in the A/UX Engineering SPR database.

## A/UX: Monitoring Memory Use (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: Monitoring Memory Use (8/94)

=====

Article Created: 27 November 1990  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

How can I see the MEMORY usage that is being given to UNIX background tasks, UNIX command shell tasks, the Macintosh Finder shell, and the Macintosh applications running within it?

I am trying to find the optimum amount of RAM to reduce the amount of paging and swapping.

For example, when configuring a system for 16MB of virtual memory, with 8MB of physical RAM, it is difficult to predict when swapping occurs. Running SoftPC in these conditions sometimes brings the machine to a halt because the Finder seems to be "swapped out".

DISCUSSION -----

Currently, we don't know of any particular memory monitoring program for A/UX. However, in a CommandShell window the "pstat -m; sleep 5" in a "do while loop" may constantly report the current available memory.

From the Finder desktop, the "About This Macintosh..." DA from Apple Menu will display memory allocation information for all Finder Desktop programs including CommandShell.

To monitor the memory use for each component--like UNIX tasks, CommandShell, Macintosh applications, and so on under A/UX--you need a program that understands the A/UX kernel memory management, that can support simultaneous access by both 24- and 32-bit applications, and is compatible with the existing Macintosh OS Memory Manager. Such a program probably needs to hack /dev/kmem, /mac/bin/{mac24, mac32}, /mac/bin/startmac, and so on.

## MacDFT: Frozen Screen and LOGMODE Frame Sizes

Revised: 1/18/91  
Security: Everyone

MacDFT: Frozen Screen and LOGMODE Frame Sizes

=====  
This article last reviewed: 28 November 1990

TOPIC -----

I have a Token Ring problem related to MacDFT. When configuration on the host changes, MacDFT doesn't work.

### Configuration

Macintosh IIcx with Token Ring Card  
AROSE Prep 1.1.1  
Macintosh DFT 1.1

I am using my own LOGMODE table on the host. The following is copied from the file TCBMODE ASSEMBLE R1. Here is the default logmode that works:

```
M2SDLCQ MODEENT LOGMODE=M2SDLCQ
      FMPROF=X'03'
      TSPROF=X"03'
      PRIPROT=X'B1'
      SECPROT=X'90'
      COMPROT=X'3080'
      RUSIZES=X'8587'
      PSERVIC=X'028000000000185000007E00'
```

This is IBM's mode. Here is a different logmode that is unique to my site.

```
TBR3180 MODEENT LOGMODE=TBR3180

      FMPROF=X'03'
      TSPROF=X"03'
      PRIPROT=X'B1'
      SECPROT=X'90'
      COMPROT=X'3080'
      RUSIZES=X'87C7'
      PSERVIC=X'0280000000000000000000300'
```

The problem is that when I use my own logmode, the screen freezes the session, and the user has to do a terminal reset to return to normal. This problem is consistently reproducible. The same problem does not occur when using Avatar or MacIrma products.

DISCUSSION -----

The system network administrator asked for the "I" and "T" frame sizes supported on our TokenTalk NB card, and this turns out to be the source of the problem. The frame sizes are fixed at 256 and can't be modified. You chose to provide multiple configurations for the frame sizes depending upon the user's needs. If you make the change to Apple's supported size, your system should work fine on the released version of MacDFT.

## AppleShare PC: Minimum Files Needed for File Services

Revised: 1/18/91  
Security: Everyone

AppleShare PC: Minimum Files Needed for File Services

=====

This article last reviewed: 28 November 1990

TOPIC -----

What is the bare minimum for AppleShare/PC files needed to access FILE SHARING only? The following is the list of files I am currently loading, and I need to free up at least 60K of RAM:echo off.

```
C:\ASPC\LSL
C:\ASPC\ENET3CII /NAME=ETHER$
C:\ASPC\AARP
C:\ASPC\ATALK
C:\ASPC\ASP_WS
C:\ASPC\AppleShare
C:\ASPC\MINSES
C:\ASPC\REDIR
C:\ASPC\ANET AUTO
```

Any chance I could take some of these out?

DISCUSSION -----

You have the minimum files necessary for what you want. Depending on the type of hardware you are using, it may be possible to load some parts of AppleShare PC into high memory (you need a 386 machine with a minimum of 1MB of RAM). This would free up more than the 60K that you are looking for.

If you want to check the files you do have, you could re-run the Installer and specify file services only, that will install the minimum set.

## MacX Under A/UX: When xcalc Doesn't Accept Keystrokes (4/93)

Revised: 4/26/93  
Security: Everyone

MacX Under A/UX: When xcalc Doesn't Accept Keystrokes (4/93)

=====

Article Created: 18 November 1990

### Article Change History

-----

04/20/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

When running MacX under A/UX I noticed that I couldn't type to the xcalc client running under A/UX. However, both X for A/UX and eXodus handled the keystrokes.

### DISCUSSION -----

xcalc doesn't accept keystrokes when displayed in rootless style. This has been reported to A/UX Engineering. A workaround is to display xcalc in a rooted window, as you were doing with native X and eXodus.

Instead of this:

```
xcalc -display <yourmac>:0.0
```

Use this:

```
xcalc -display <yourmac>:0.1
```

The ".1" causes xcalc to be displayed in the rooted monochrome window. In this style, it seems to work fine. For more information on rooted versus rootless windows, refer to chapter 1, page 12, of the Apple MacX manual from the A/UX manual set.

This has been fixed in A/UX 3.0 and MacX 1.2.

## Macintosh-to-HP/UX Connectivity

Revised: 1/18/91  
Security: Everyone

Macintosh-to-HP/UX Connectivity

=====

This article last reviewed: 28 November 1990

TOPIC -----

I have an HP9000 running HP/UX and a LocalTalk network with many Macintosh systems and connected by Farallon's PhoneNET StarController system. I would like to convert the LocalTalk system to run Ethernet (Farallon has the PhoneNET StarController EN, which should do the job).

However, HP's implementation of TCP/IP runs across 802.3 networks and not Ethernet. Our TCP/IP implementation (via MacTCP) pumps out Ethernet packets and not 802.3. I want to connect the Macintoshes to the HP/UX system to do file transfer (no file conversion necessary), terminal emulation, and SMTP.

Can you suggest any third-party gateways that can convert Ethernet packets to 802.3 on an Ethernet-based StarController EN network? Do you see any potential problem to implementation based on the PhoneNET StarController EN to HP/UX?

DISCUSSION -----

The product of choice for this type of conversion seems to be the cisco router. If you want to translate HP 802.3 to Ethernet on the same cable, you can configure the cisco to do that. It's been in the product for three or four years. 802.3 to Ethernet was one of their original design goals.

If you want or need a bridge, HP bridges work fine with both Ethernet and HP 802.3 encapsulation. For more details, search the Technical Info library under "cisco."

## LaserWriter: Printing on Heavy Paper

Revised: 1/18/91  
Security: Everyone

LaserWriter: Printing on Heavy Paper

=====

This article last reviewed: 28 November 1990

TOPIC -----

Can any LaserWriter print on 65-pound paper (card stock used on shelves)?

DISCUSSION -----

The "LaserWriter II Owner's Guide" specifies the paper at:

16-lb. to 20-lb. photocopy or typewriter bond (60 to 80 g/m2) in normal mode; up to 36-lb. (135 g/m2) stock in manual mode with face-up tray open.

We don't know of a way to use a LaserWriter to print on 65-pound paper. The LaserWriter paper path will not support paper of that thickness, nor is there enough heat to fuse the toner through paper that thick.

You can, of course, use the LaserWriter to print labels and stick them to any thickness of paper. Labels as large as 8.5 X 11 are available.

## Personal LaserWriter NT Software Switching

Revised: 1/18/91  
Security: Everyone

Personal LaserWriter NT Software Switching

=====

This article last reviewed: 28 November 1990

TOPIC -----

Is it possible to soft switch the Personal LaserWriter NT between PostScript and HP Emulation? The PostScript code for the LaserWriter IINTX doesn't seem to work.

DISCUSSION -----

You are correct, the PostScript code for the LaserWriter IINTX for software mode switching does not work on the Personal LaserWriter NT. The "setsoftwareiomode" value, which is used in the LaserWriter IINTX to set the mode, is not defined in the Personal LaserWriter NT.

However, you can use software switching to switch the Personal LaserWriter NT temporarily from PostScript to HP LaserJet+ or Diablo emulation. To emulate the HP LaserJet+, send the following PostScript to the Personal LaserWriter NT:

```
statusdict begin
currentfile /hpcl emulate
```

To emulate the Diablo, send the following PostScript to the Personal LaserWriter NT:

```
statusdict begin
currentfile /Diablo emulate
```

This DOES NOT work the same way software switching to set the mode on a LaserWriter IINTX works. As soon as this job is completed, the Personal LaserWriter NT will change back to PostScript mode. Therefore, you must send this code at the beginning of each job with the job appended to it. To do this, you could put the previous PostScript code in a file, say "hpcl.ps". Then, to print a job in HP LaserJet+ mode from a PC, type:

```
copy hpcl.ps+filename.txt lpt
```

This would send the file you want printed in the same job as the PostScript code that switches the Personal LaserWriter NT to HP LaserJet+ mode. If these files are sent separately, the Personal LaserWriter NT will have already reset back to PostScript mode before the file to be printed reaches the printer.

As this PostScript must be sent with every job, a file cannot be printed straight from a program to the Personal LaserWriter NT. The file would have to be saved to disk, and then sent to the Personal LaserWriter NT as specified above.

You can also set the pushwheel switch on the Personal LaserWriter NT for HP LaserJet+ or Diablo emulation. Switch position 2 sets it to HP LaserJet+ mode, and switch position 3 sets it to Diablo mode.

## Personal LaserWriter NT: How to Print IBM ECS Characters

Revised: 5/19/93  
Security: Everyone

Personal LaserWriter NT: How to Print IBM ECS Characters

Article Created: 28 November 1990

### Article Change History

-----  
05/18/93 - CORRECTED

- To correct PostScript code found in the article

### TOPIC -----

Please give me some information about the use of the IBM Extended Character Set ECS in the Personal LaserWriter NT.

- Can you use ECS with standard Macintosh software (e.g., word processing)?
- Can you use ECS with SoftPC?
- How can we use ECS from a PC running AppleShare PC?

### DISCUSSION -----

The ECS character set in the Personal LaserWriter NT is implemented as an extension to Diablo emulation, as opposed to an independent PostScript font. In fact, it is designed to behave like the IBM PC Graphics ECS print wheel for Diablo 630 daisy wheel printers. This creates some interesting requirements for its use with different host computer environments and also imposes some limitations on how the special characters can be used.

Each of the three scenarios you list requires its own sequence of steps to print documents using ECS characters. Although the setup for each is different, the basic procedure is the same. It follows these basic steps:

- 1) Connect to the LaserWriter in PostScript mode.
- 2) Send code that enables ECS.

- 3) Switch to Diablo emulation.
- 4) Print the desired characters.

Unfortunately, Diablo emulation is not documented well in the "Personal LaserWriter NT Owner's Guide." Although code is provided to enable ECS, no mention is given of software mode-switching or the other options available for the DiabloDefaults dictionary. We'll cover the required basics here, and also provide a list of the different dictionary values and their meanings.

Setting the Personal LaserWriter NT to Diablo mode with the thumb-wheel switch requires disabling network access. Because of this, we'll avoid hardware switching in our examples and stick with software switching. We're assuming a Macintosh and Personal LaserWriter NT connected to an AppleTalk network along with an IBM PC using AppleShare PC.

Enabling ECS in the LaserWriter requires the following code. It can be entered in a text file and then downloaded using the psdump utility.

```
serverdict begin 0 exitserver
statusdict begin
DiabloDefaults /ecs true put
saveDiabloDefaults
```

This will persist, until it is forced back by the same code using "/ecs false" in place of "/ecs true". You needn't repeat this step, unless it has been intentionally reversed.

Now, we switch to Diablo emulation and send the desired text to be printed. Software switching of the Personal LaserWriter NT differs from hardware switching (and from software switching of the LaserWriter IINTX) in that it only persists until the end of the print job. Any Diablo text or ECS characters must be appended to the switching code or be treated as a separate print job:

```
statusdict begin currentfile /diablo emulate
This text will be printed as if the Personal LaserWriter NT
were a Diablo 630.
```

If the above lines were downloaded to the LaserWriter with psdump, the second two lines would be printed verbatim. If there were special ECS characters, those would be printed as well.

We can't show any of the actual ECS characters in this article, but we can show you how to generate them. The ECS character set is essentially an expanded version of the standard Diablo character set. The special characters lie in the ASCII ranges below 31 and above 126. The following Microsoft BASIC program creates a text file with the special characters in the high range of 127 through 255.

```
10 open "ECS_STUF.TXT" for output as #1
20 for i=127 to 255
30 print #1, chr$(i);
```

```
40 if (i-126)/70 = int((i-126)/70) then print #1, ""
50 next i
60 close #1
```

A similar HyperCard script could be used to create the file on a Macintosh.

```
on mouseDown
  put "High ASCII ECS Chars" into filename
  open file filename
  repeat with i = 127 to 255
    write numToChar(i) to file filename
    if (i-126)/70 = (i-126) div 70 then write return to file filename
  end repeat
  close file filename
end mouseDown
```

To print these files, prefix them with the Diablo emulation PostScript code from above and download the result with psdump. The result should be a page with two lines of the high ASCII ECS characters.

## A/UX 2.0: How to Customize Session Types

Revised: 11/9/92  
Security: Everyone

A/UX 2.0: How to Customize Session Types

=====

Article Created: 1 January 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

During the login phase, you can choose different logins (Session Type). How can I customize this environment -- to launch X, for instance?

### DISCUSSION -----

When the X11 Window System is installed, the X11 session automatically will be created in the /mac/lib/sessiontypes directory.

The code below shows how the X11 session is created from an X11.r resource file. The X11.r file is as follows:

```
/*
 * description file for X11 session type.
 */

resource 'STR#' (128) {
{
/* The name that the user selects in the list box. */

    "X11";

/* The description of this session type. */

    "X11 is Apple's adaptation of the industry standard "
    "X Window System for A/UX. X11 is a pure X environment, "
```

```
"and no Macintosh compatibility is provided.";  
  
/* The command that gets executed for this session type. */  
  
"/usr/lib/X11/X";  
  
/* Name of file to look for in user's home directory to run */  
/* instead of command given above. */  
  
".X11"  
  
}  
};
```

Then the following commands create the X11 resource file:

```
/mac/bin/rez -i /:mac:lib:rincludes types.r X11.r  
fcvt -f -s Rez.out X11  
rm -f Rez.out
```

With the above example, you can create your own session.

## Macintosh Portable: Use the Sound Manager From 6.0.7

Revised: 1/18/91  
Security: Everyone

Macintosh Portable: Use the Sound Manager From 6.0.7

=====

This article last reviewed: 30 November 1990

TOPIC -----

I have developed an application in C through which I can connect a Portable to one of a phone switches and establish a session with the switch and then play some background music on the Portable. This code has worked on numerous Macintosh II systems, but fails on the Portable (quits the application, returning to Finder without a warning).

The Portable has 2MB of RAM and System 6.0.5. I am using identical pieces of code on both machines and the toolbox calls are the same. Some have suggested that there may be a difference in the sound architectures of the Macintosh II family and the Portable family that requires different calls to the Sound Manager for the Portable.

DISCUSSION -----

The Sound Manager prior to System Software 6.0.7 was known to have problems. Our first suggestion is to install 6.0.7 on the Portable. The new Sound Manager does have additional functionality. However, all previous interface calls are still valid. The new Sound Manager has been totally rewritten, providing a more robust tool.

Because the application appears to be working in certain environments, it would seem one of the problems of the old Sound Manager becomes obvious when used on the Portable. Using the new Sound Manager shipped with 6.0.7 should provide a solution.

## LaserWriter: Macintosh SE Connection with ImageWriter Cable

Revised: 1/18/91  
Security: Everyone

LaserWriter: Macintosh SE Connection with ImageWriter Cable

=====

This article last reviewed: 30 November 1990

TOPIC -----

I hooked up a LaserWriter IINT to a Macintosh SE for local printing using an ImageWriter cable, and it worked! Is this okay?

DISCUSSION -----

When you connect to a LaserWriter in this fashion, you are in reality still running LocalTalk between the Macintosh and the LaserWriter. Although this works in most cases, it is not a supported configuration, and we do not recommend using it. Instead, use the proper cabling necessary to implement a LocalTalk connection between the LaserWriter and the Macintosh.

## LaserWriter: Problem with Heat-Sensitive Adhesive on Envelopes

Revised: 2/12/93  
Security: Everyone

LaserWriter: Problem with Heat-Sensitive Adhesive on Envelopes

=====

Article Created: 24 January 1991

### Article Change History

-----

02/12/93 - UPDATED  
• Vendor information.

### TOPIC -----

Why does Personal LaserWriter SC seal envelopes as they pass through it? Is there a fix or a workaround?

### DISCUSSION -----

The mechanism used in the Personal LaserWriter NT and SC may seal envelopes that are not rated for laser printer or copier use. Any laser printer that uses the Canon P-110 engine behaves similarly. This is caused by heat-sensitive adhesive. We have seen it occur with various envelopes, though some that are not labeled as "laser rated" don't have the problem. The deciding factor is the kind of adhesive used.

You may notice a difference between the LaserWriter II and Personal LaserWriter series. The major difference is the slower paper speed of the Personal LaserWriter engine. The Personal LaserWriter moves material over the drum at half the speed of the LaserWriter II, giving the paper or envelope twice as long to absorb heat.

One method of preventing sealing is to separate the envelope flap the moment it ejects from the LaserWriter, but the real solution is to use envelopes that have been designed for compatibility with laser printers or copiers. Two suppliers you might contact are James River Corporation and Avery.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## LaserWriter 6.0.1: Changes that Address Timeout Problems

Revised: 1/24/91  
Security: Everyone

LaserWriter 6.0.1: Changes that Address Timeout Problems

=====

This article last reviewed: 30 November 1990

TOPIC -----

When LaserWriter 6.0.1 driver came out, there was a specification sheet describing what was in 6.0.1 and how it helped resolve network timeout problems with LaserWriter IINTs and LaserWriter IINTXs. Can you summarize what it said about timeouts?

DISCUSSION -----

The LaserWriter 6.0.1 driver changed two timer settings:

Previously, if part of a print job, a packet, intended for the LaserWriter got lost and wasn't resent in time to reach the LaserWriter within 30 seconds, the print job would be flushed. This low-level timer was eliminated. (Now the PostScript job will timeout after 5 minutes if a packet is "permanently" lost.)

Additionally, if the printer was busy printing something, like multiple copies of a complex document, the connection timer could time out. Now, the Macintosh waits for 3 minutes (previously 2) for the printer to respond before timing out.

The first job is much more likely to occur on large networks where routers are used. The second problem is more prevalent with printing complex documents on the slower LaserWriters (e.g., a LaserWriter IINT as compared to a LaserWriter IINTX).

## Macintosh Portable: Touchbase External 9600-Baud Modem

Revised: 1/24/91  
Security: Everyone

Macintosh Portable: Touchbase External 9600-Baud Modem

=====

This article last reviewed: 30 November 1990

TOPIC -----

I'm seeking a 9600 baud internal modem for the Macintosh Portable that is compatible with the Shiva NetModem v.32.

DISCUSSION -----

As of October, 1990, we haven't heard of any internal 9600 baud modems for the Macintosh Portable. However, Touchbase Systems just announced an external portable modem, the WorldPort 9600.

The WorldPort 9600 is a portable V.32, 9.6Kb self-powered modem for laptop computers. The WorldPort 9600 supports full-duplex synchronous and asynchronous communications. The 8-ounce modem contains an EIA-232 port for direct connection to a laptop. It runs under its own 9V battery or via an optional external AC adapter

The 9600 features Trellis coding, echo cancellation, fallback speeds from 300 bits to 4.8 bits and MNP Class 4 error correction. It supports the Hayes AT command set and CCITT V.21, V.22, B.22bis, V.23, and Bell 103 and 212A standards.

## MacDFT: To Print Screen, Turn Background Printing Off

Revised: 1/24/91  
Security: Everyone

MacDFT: To Print Screen, Turn Background Printing Off

=====

This article last reviewed: 30 November 1990

TOPIC -----

I am having problems printing screens with MacDFT 1.1. No matter what I do, the "Print Screen" option remains dimmed.

DISCUSSION -----

To work around a bug in the Print Monitor, MacDFT does not allow "Print Screen" to be selected when background printing is on. To print screens with MacDFT, turn background printing off.

## A/UX: vn\_rele Panic Message (9/94)

Revised: 9/22/94  
Security: Everyone

A/UX: "vn\_rele" Panic Message (9/94)

=====  
Article Created: 24 January 1991  
Article Reviewed/Updated: 22 September 1994

TOPIC -----

When I log out of a session on A/UX, I get the message:

```
panic: vn_rele
```

This happens on a Macintosh IIfx with miroGRAPH graphics board, Ethernet NB Card, 200MB Conner Drive (one UNIX partition, c0d0s0, partitioned with SilverLining).

What does the above panic message mean, what are its causes, and what do I do about them? These other panic messages were encountered when doing an "fsck" on the file system after the above panic message: "panic: free freeing free block" and "panic: ialloc\_dup alloc".

The display on the above machine changes its size on booting A/UX (the menu bar gets squeezed downwards). Is this just a problem with the third-party monitor card? Does A/UX reset the monitor card on booting the kernel?

DISCUSSION -----

It seems that you had a UFS root file system problem on the Conner hard drive.

The above "panic: vn\_rele" message occurs when the A/UX UFS file system tries to do a vn\_rele function (release a vnode and decrement the reference count) to maintain its file system data structure. Panic occurs when the reference count reaches to 0. Both the "free freeing free block" and "ialloc\_dup alloc" panic messages indicate that there is a bad free-block list and duplicate inode allocations in the UFS super block.

We don't know the parameters used when the UFS root file system was created on the Conner drive. These parameters (like the number of sectors, tracks, and cylinders) must be specific to the Conner drive.

If the parameters used to create a UFS file system do not match the drive, we suggest that you rebuild the UFS file system with the correct values. Otherwise, try to "fsck" the root file system (you can do the "fsck" in #startup mode) to make a clean root file system.

We haven't seen the menu bar squeezed problem on our third-party monitor while A/UX is booting. Check with the vendor about this problem. Yes, A/UX does a reset on the monitor card when the A/UX kernel is loaded.

## HyperCom 2.0 Allows HyperAppleTalk Access across Zones (11/94)

Revised: 11/8/94  
Security: Everyone

HyperCom 2.0 Allows HyperAppleTalk Access across Zones (11/94)

=====

Article Created: 24 January 1991  
Article Reviewed/Updated: 08 November 1994

TOPIC -----

Is there a new version of HyperAppleTalk that supports multiple zones? Or is there another product that can support multiple zones in a network?

We have a system developed in HyperCard and HyperAppleTalk. When we changed our network configuration, the system didn't work, because HyperAppleTalk could not "see" different zones.

DISCUSSION -----

There are no revisions planned to HyperAppleTalk. You can use a commercial product or create your own configurations with the Communications Toolbox Toolkit.

The commercial product that does allow HyperAppleTalk access across zones is "HyperCom 2.0" by GAVA Corporation.

Here is an excerpt from the "Read Me" file for the Communications Toolbox Toolkit that should effectively replace HyperAppleTalk. Use the following path to find the toolkit:

Developer Support  
  Developer Services  
    Development Platforms  
      HyperCard Related  
        HyperCard ToolKits  
          Communication Toolbox Toolkit

"A license from Apple is required if source code, XCMDs, or XFCNs supplied with this product is to be used in commercial applications. Contact Apple Software Licensing for more information.

This toolkit contains everything you need to access the facilities of the Communications Toolbox from HyperCard. Besides the XCMDs and XFCNs needed, the toolkit also provides a complete set of documentation, and the full source code for the XCMDs and XFCNs.

The toolkit disk includes:

- CTB Toolkit Docs--A HyperCard stack describing the Communications Toolbox XCMDs and XFCNs.
- CTB Configuration Docs--A HyperCard stack which lists the configuration string parameters for the basic Communications Toolbox tools. These strings are used to configure a tool from within a script.
- CTB Toolkit Example--A HyperCard stack that uses the toolkit. This should serve as an example of how to get started using these facilities.
- Net Looker--An example of using the name binding protocol (NBP) XCMDs included with the toolkit. This stack lists zones and names on the local network.
- Source Code--A folder containing the complete source code for the toolkit."

## DAL: Model 204 and IMS Databases Not Supported (11/94)

Revised: 11/7/94  
Security: Everyone

DAL: Model 204 and IMS Databases Not Supported (11/94)

=====

Article Created: 3 December 1990  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

Is there a database product called "Model 204" which runs on IBM mainframes? If so, is there any way for Data Access Language (DAL) to connect to it now or in the future? Can (or will) DAL interact with IMS data bases?

DISCUSSION -----

Model 204 is an on-line and batch DBMS built on a proprietary inverted file access method. The system includes an integrated data dictionary for flexibility in defining and protecting data acquisition. An inverted file, relational system, like Model 204, can support applications that require very large data bases, high transaction volumes, and a large number of concurrent users--all with a high degree of flexibility and efficiency. In that respect, it differs significantly from the standard relational DBMSs that are notoriously slower and more cumbersome to manipulate.

The Model 204 system is fully integrated, with its own query language and communications interfaces to CICS, CMS, and Thorn EMI's Shadow II. It comes with its own 4GL and can support most popular third-generation languages.

Model 204 can also be configured in a mainframe-microcomputer environment with its PC/Workshop product. It also supports a LAN environment.

Currently, DAL supports neither Model 204 or IMS database. There is no plan in the near future for supporting these two products.

## Macintosh LC: PDS-Based Coax Card

Revised: 7/23/92  
Security: Everyone

Macintosh LC: PDS-Based Coax Card

=====  
Article Created: 3 December 1990  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

### TOPIC -----

Is there a coax board for the Macintosh LC? With its new form factor of 3 X 7 inches, none of the earlier cards fits. (Tri-Data Netways won't be used.)

### DISCUSSION -----

We assume that many vendors are looking into this, including Avatar as in the following article from "Apple Intro News". With Avatar Corporation's new MacMainFrame Series, Macintosh LC computer users can connect with IBM 3270 mainframes.

"The MacMainFrame Series for the Macintosh LC includes the MacMainFrame Coax Workstation, which offers a Coax-attached internal card that fits into your Macintosh LC 020 Processor Direct Slot for direct connection to an IBM 3270 network. It provides either 1-session CUT or 5-session DFT emulation. The MacMainFrame Coax Gateway provides Macintosh work groups with access to up to five IBM host sessions.

"The MacMainFrame Token Ring Workstation provides a direct connection to a Token Ring network giving you access to up to 8 IBM 3270 sessions. The MacMainFrame Token Ring Gateway allows Macintosh users in an AppleTalk environment to run host applications on an IBM host that resides on a Token Ring network.

"The MacMainFrame SDLC Workstation allows you to directly access host information over a local or remote Synchronous Data Link Control (SDLC) connection. The MacMainFrame SDLC Gateway provides a Macintosh work group in an AppleTalk environment with local or remote access to an IBM host over an SDLC connection."

## FTP Servers for the Macintosh

Revised: 1/24/91  
Security: Everyone

FTP Servers for the Macintosh

=====

This article last reviewed: 3 December 1990

TOPIC -----

Is there a product that supports an FTP server on the Macintosh that runs in the background? We have a requirement to send files from TCP/IP equipped VAX and UNIX machines to a Macintosh in the background. Does the Apple Comm Toolbox support this? Does the Comm toolbox support socket-level programming? What other products support socket-level programming?

DISCUSSION -----

The CommToolBox does not provide support for socket-style programming while using MacTCP. There are currently no commercial products that provide a socket-style interface for MacTCP.

There are two commercial products that provide an FTP server for the Macintosh. They are:

- Advanced Software's TCPack. It supports Telnet and ftp (client and server) protocols.
- InterCon's TCP/Connect II. It supports Telnet, snmp, SLIP, nntp, POP2, finger, smtp, and ftp (client and server) protocols.

There is a non-commercial (public domain) product that provides an FTP server for the Macintosh. That is NCSA Telnet from the University of Illinois at Champaign. It supports telnet and ftp (client and server) protocols.

The University of Toronto has a MacTCP-based socket library. This is a public-domain, non-supported product.

Novell also provides a socket-level interface to their TCP/IP product (LAN workplace). This product is not based on MacTCP, but on their own TCP/IP implementation.

A/UX: How to Rebuild Desktop (5/95)

=====

Article Created: 24 January 1991  
Article Reviewed/Updated: 8 May 1995

TOPIC -----

How do you rebuild the desktop under A/UX?

DISCUSSION -----

Follow these steps to rebuild the desktop:

- 1) Login to the A/UX Command Shell as root user.
- 2) `rm /mac/sys/'System Folder'/.fs_cache`
- 3) `rm /mac/sys/'System Folder'/*Desk*`
- 4) Logout and Login to the A/UX Finder environment.
- 5) When you see a dialog asking "Are you sure you want the desktop rebuilt..." click OK to rebuild the Desktop Database. Rebuilding the desktop may take some time, depending on the amount of local disk space attached.

An alternative to this method follows:

- 1) Logout and Login to the A/UX Finder environment
- 2) After the "Starting session for username..." dialog disappears, press and hold both the "Option" and "Command" keys until you see a dialog asking "Are you sure you want the desktop rebuilt...".
- 3) Click OK to rebuild the Desktop Database. Rebuilding the desktop may take some time, depending on the amount of local disk space attached.

## Black & White Displays: Bibliography

Revised: 1/24/91  
Security: Everyone

Black & White Displays: Bibliography

=====

This article last reviewed: 3 December 1990

TOPIC -----

When the Macintosh first came out, Apple cited studies indicating that a black on white display was superior to white/green/amber on black ones. The reasoning had to do with easier focusing due to a brighter screen closing the iris, and less adjustment required of the eye when looking between paper and screen. Can you cite the references we used to support these conclusions?

DISCUSSION -----

There were two studies in 1980, and the information can be found in the following books:

- Radl. "Ergonomic Aspects of Visual Display Terminals"; London Taylor and Francis, 1980.
- Bauer and Cavonius. "Improving the Legibility of Visual Display Units through Contrast Reversal"; 1980.

There is also a newer book that summarizes the information in the other two books:

- Etienne Grandjean. "Ergonomics in Computerized Offices"; 1987.

## AppleTalk Network: Remote Dial-In Access from MS-DOS

Revised: 7/23/92  
Security: Everyone

AppleTalk Network: Remote Dial-In Access from MS-DOS

=====

Article Created: 24 January 1992  
Article Last Reviewed: 4 December 1990  
Article Last Updated: 22 June 1992

TOPIC -----

I want to add a remote on-campus PC-compatible to our AppleTalk network, via a Northern Telecom SL-1. We're planning to install a Liaison router on the LocalTalk side. Is there an MS-DOS-based, asynchronous, dial-up Liaison client product available for the PC (like the Macintosh version)?

DISCUSSION -----

With DOS Dial-In (a Shiva product) a remote PC can dial into a LocalTalk network and access files on a TOPS server or print to a LaserWriter. You will need the following at the remote site:

- PC with a COM port
- a modem (9600 bps recommended)
- DOS Dial-In software
- TOPS/DOS 3.0 software (FlashCard not needed)

On the network you need:

- a Macintosh or PC running with a TOPS volume published and either
  - a Shiva TeleBridge or EtherGate with the same make and model modem; or
  - IF you are using a V.32 Hayes-compatible modem on PC, a Shiva NetModem V.32

As of October, 1990, DOS Dial-In supports TOPS file-sharing only. AppleShare will be added very shortly. You can currently access E-mail with DOS Dial-In

as well. You should use QuickMail, Microsoft Mail, or InBox. You need to use the TOPS drivers on the remote PC to use these mail packages with DOS Dial-In.

Solana also has a product, "PC NetAccess," through which MS-DOS computers can dial-in to an AppleTalk network via their R-Servers.

Editor's Note 22 June 1992: Solana has discontinued business to our knowledge, so we are unable to refer you to them directly for further information.

• Vendor names.

To help ensure that you have an appropriate version of the application program you intend to use, Apple Computer, Inc., has compiled this list from information received from certain software developers. These developers have recommended certain versions of their software for use with the Macintosh LC computer. This is by no means a comprehensive list of programs or versions of programs that are compatible with the Macintosh LC.

Please contact your dealer or the software developer if you have any questions. They can help you identify the newest version of a particular program or tell you how to upgrade your current version if necessary. For best results, we recommend you use the latest versions of software and hardware products with your Macintosh LC.

• Vendor names.

To help ensure that you have an appropriate version of the application program you intend to use, Apple Computer, Inc., has compiled this list from information received from certain software developers. These developers have recommended certain versions of their software for use with the Macintosh LC computer. This is by no means a comprehensive list of programs or versions of programs that are compatible with the Macintosh LC.

Please contact your dealer or the software developer if you have any questions. They can help you identify the newest version of a particular program or tell you how to upgrade your current version if necessary. For best results, we recommend you use the latest versions of software and hardware products with your Macintosh LC.

| Developer         | Application Program           | Versions | Phone Number |

## A/UX: Setup for Modem Autoanswer (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: Setup for Modem Autoanswer (8/94)

=====

Article Created: 29 October 1990  
Article Reviewed/Updated: 25 August 1994

TOPIC -----

What setting is necessary to have a 1200 baud modem autoanswer from the modem port?

DISCUSSION -----

In A/UX, if you have a problem talking with the modem, first try running `stty -g /dev/tty0 -modem`. This will disable modem control on the modem port. In the `/etc/inittab` subdirectory, make two changes to the line for the modem port as follows:

change the "off" to "respawn"

change the "at\_9600" to "mo\_1200"

Note: If you have a 2400 baud modem, the last expression should be "mo\_2400".

## A/UX: Giving the System its Domain Name (6/93)

Revised: 8/12/93  
Security: Everyone

A/UX: Giving the System its Domain Name (6/93)

=====

Article Created: 29 October 1990  
Article Reviewed/Updated: 23 June 1993

TOPIC -----

Why doesn't my system know its domain name?

DISCUSSION -----

This is a consequence of having an empty /etc/inittab file. It happens because the /etc/sysinitrc file is not being executed. Once you recover the /etc/inittab file, the system domain name will be defined correctly.

## A/UX: How to Adjust the Kernel Parameter NUBUFS

Revised: 9/30/92  
Security: Everyone

A/UX: How to Adjust the Kernel Parameter NUBUFS

=====

Article Created: 29 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I want to connect to Ethernet. The figures for a 5MB configuration were typed in. Running the command

```
netstat -r
```

brings up the message

```
mexpand returning 0
```

### DISCUSSION -----

A request to allocate memory to use for memory buffer space was denied. Wait a short while, and see if the condition clears up before rebooting. You may also consider increasing the size of the buffers available; adjust the kernel parameter NUBUFS. To do this, follow these steps:

- 1) Log in as "root" and bring the system down into single-user mode.
- 2) Execute "kconfig -av | grep NMBUFS". It should return the network memory buffers configured in the kernel. A/UX is distributed with NMBUFS=500.
- 3) Type "kconfig -n /unix"
- 4) Type "NMBUFS=" followed by the number you would like to increase it to

followed by a carriage return. Try increasing the number of mbufs to 1000; type "NMBUFS=1000"

5) Type a Ctrl-D to exit kconfig. The shell prompt will reappear.

6) Execute "sync; sync; sync; reboot". The system will sync and reboot itself. Bring it back up.

## A/UX: The mount: <directory>: Not owner Mount Error

Revised: 11/9/92  
Security: Everyone

A/UX: The "mount: <directory>: Not owner" Mount Error

=====

Article Created: 28 January 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I tried to mount a file system and got the error:

```
mount: <directory>: Not owner
```

### DISCUSSION -----

Do these two steps:

- 1) You must be logged in as "root" when mounting partitions.
- 2) Enter the line: whoami

The output should be: "root". If it isn't, log in as "root" and try the mount again.

## A/UX: Network Reads Take Longer than Writes

Revised: 11/9/92  
Security: Everyone

A/UX: Network Reads Take Longer than Writes

=====

Article Created: 18 January 1991

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Reading data over a network takes longer than writing. The code writes data from a Macintosh II over a dedicated network to another Macintosh II running A/UX. By the time the write is done on the server, the client is only about 80% done.

### DISCUSSION -----

Engineering believes that reading takes longer because after the data is taken from the network, it has to go through the IP, TCP, or UDP translation and then to the system read buffer. As a solution, try increasing NBUFS size.

## 800K Macintosh Disk: Sector and Track Info

Revised: 6/18/92  
Security: Everyone

800K Macintosh Disk: Sector and Track Info

Article Created: 13 December 1990  
Article Last Reviewed: 18 June 1992  
Article Last Updated:

TOPIC -----

I have three questions about 800K Macintosh disks:

- 1) How many sectors are there per side?
- 2) Is the top or the bottom of the disk used first for data storage?
- 3) What are the sync lengths of the tracks?

DISCUSSION -----

- 1) The table below states the formatted capacity of the 800K media:

### 800K Disk Specifications

|                   |               |
|-------------------|---------------|
| Bytes per Sector  | 512           |
| Tracks per Side   | 80            |
| Sectors per Track |               |
| Tracks 00-15      | 12            |
| Tracks 16-31      | 11            |
| Tracks 32-47      | 10            |
| Tracks 48-63      | 9             |
| Tracks 64-79      | 8             |
| Sectors per Side  | 800           |
| Sectors per Disk  | 1600          |
| Bytes per Side    | 409600 (400K) |
| Bytes per Disk    | 819200 (800K) |

- 2) The bottom of the disk is side 0; the top of the disk is side 1. The first sector, block 0, is on track 0 of side 0. The last sector, block 1599,

is on track 79 of side 1.

- 3) A sector can be divided into four major sections. These are the header sync field, the header field, the data sync field, and the data field. These fields combined add up to 733.5 code bytes minimum.

Header Sync Field (6.25 bytes + sync overhead):

5 bit slip FF's minimum (FF,3F,CF,F3,FC,FF)

The header sync fields contain a pattern of ones and zeros that synchronizes the hardware state machine with the data on the disk. The header sync and headers field are written only when the disk is formatted. The formatter should make this field as large as possible, because this field buffers expansion of the previous sector's data field due to speed variation of the drive.

Header Fields (11 bytes):

The header field identifies the sector. The sub-fields are:

|          |                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| D5 AA 96 | address marks: this identifies the fields as a header field                                                                                                                                               |
| Track    | encoded low 6 bits of track number                                                                                                                                                                        |
| Sector   | encoded sector number                                                                                                                                                                                     |
| Side     | encoded high 2 bits of track number and side bit:<br>decoded bit 5=0 for side 0, 1 for side 1<br>decoded bit 0 is the high-order bit of the track number<br>decoded bits 1-4 are reserved and should be 0 |
| Format   | encoded format specifications:<br>decoded bit 5=0 for single-sided formats<br>decoded bits 0-4 define format interleave:<br>standard 2:1 interleave formats have 2 in the field                           |
| Checksum | checksum formed by exclusive 'or' in the track, sector side, and format fields                                                                                                                            |
| DE AA    | bit slip marks: this identifies the end of the field                                                                                                                                                      |
| Off      | pad byte where the write electronics were turned off                                                                                                                                                      |

Data Sync Field (6.25 bytes):

5 bit slip FF's (FF,3F,CF,F3,FC,FF)

The data sync field contains a pattern of ones and zeros that synchronizes the state machine with the data on the disk. This field is written whenever the data field is written.

Data Field (710 bytes):

The data field contains the actual data in the sector. The sub-fields are:

|              |                                                          |
|--------------|----------------------------------------------------------|
| D5 AA AD     | data marks: this identifies the field as a data field    |
| Sector       | encoded sector number                                    |
| Encoded Data | 524 bytes encoded into 699 code bytes; the first 12 data |

bytes are typically used as a sector tag by the operating system, and the remaining 512 bytes are used for actual data.

|          |                                                      |
|----------|------------------------------------------------------|
| Checksum | a 24-bit checksum encoded into 4 code byte           |
| DE AA    | bit slip marks: this identifies the end of the field |
| Off      | pad byte where the write electronics were turned off |

## AppleTalk for VMS 2.1 and 3.0: Compatibility with VMS 5.4

Revised: 1/28/91  
Security: Everyone

AppleTalk for VMS 2.1 and 3.0: Compatibility with VMS 5.4

=====

This article last reviewed: 28 November 1990

TOPIC -----

Has AppleTalk for VMS 2.1 & 3.0 been tested for compatibility with VMS 5.4?

DISCUSSION -----

AppleTalk for VMS 2.1 was not tested with VMS 5.4, because VMS 5.4 was not released at the time version 2.1 was tested. However, AppleTalk for VMS 2.1 should work under VMS 5.4.

There is a larger issue here that ties into your question about AppleTalk for VMS 3.0. In fact, there is only one choice, and that is AppleTalk for VMS 3.0 (as part of PATHWORKS, formerly DEC LanWORKS). Version 2.1 was an interim release intended solely to provide AppleTalk Phase 2 compatibility until version 3.0 was released. AppleTalk for VMS 3.0 works under VMS 5.4, and that is the current VMS product superseding all other releases.

If you're running older, AppleTalk Phase 1, versions of AppleTalk for VMS, you should start moving toward AppleTalk Phase 2 and AppleTalk for VMS 3.0. The only potential difficulty here is if you have products that require the AppleTalk for VMS 2.x API. In this case, you can go to AppleTalk for VMS 2.1 until those products have been revised to support the new API of AppleTalk for VMS 3.0.

## DAL: Using \$maxrows and SELECT Statement

Revised: 6/30/92  
Security: Everyone

DAL: Using \$maxrows and SELECT Statement

=====

Article Created: 28 January 1992  
Article Last Reviewed: 30 June 1992  
Article Last Updated: 30 June 1992

TOPIC -----

I have PATHWORKS (LanWORKS BL/4) running on our MicroVAX 3400. The DAL server is version 1.2. If I go into IDAL, and set \$maxrows to 0, a select statement returns nothing. My understanding is that the \$maxrows is supposed to enable an an return unlimited amount of data.

DISCUSSION -----

We assume that you also issued the "printall;" statement after the "select" statement. Otherwise, you will not see anything printed.

The System Variables \$maxrows is initially set to null. Null is not 0 (zero). To set \$maxrows to the initial value of null, you should set it to \$null.

When \$maxrows is set to a non-null value, the SELECT and FETCH statements stop fetching data from the database when they reach the number of rows specified by \$maxrows. Setting \$maxrows to 24, for example, yields a 24 rows of database results without waiting for an entire query to complete. Setting it to 0 will result in zero rows.

## Vinyl-Cutting Signmakers for Macintosh

Revised: 1/28/91  
Security: Everyone

Vinyl-Cutting Signmakers for Macintosh

=====

This article last reviewed: 12 December 1990

TOPIC -----

Is there such a thing as a vinyl-cutting signmaker for the Macintosh?

DISCUSSION -----

We have two sources for you. The Roland Digital Group makes a machine that does precisely what you want.

Also, Mesac's "Epsi" product drives various vinyl cutters. Epsi converts PostScript to commands that cutters understand. Search the Technical Info library (under "Roland" or "Mesac" for contact information on these two companies.

## How to Clean a Mouse: Instructions Are in the Manual

Revised: 1/28/91  
Security: Everyone

How to Clean a Mouse: Instructions Are in the Manual

=====

This article last reviewed: 12 December 1990

TOPIC -----

I am having a problem cleaning my mouse. I thought I did everything correctly, but the mouse is still "jumpy" (usually a sign of a dirty mouse). Where can I find a document explaining the cleaning procedure?

DISCUSSION -----

The directions on how to clean the Macintosh mouse is in one of the manuals that comes with each Macintosh system. For example, look in the index of the "Macintosh Plus Owner's Guide" under "cleaning." You should see an entry for the mouse (pages 196 and 197). For the Macintosh IIx, look in the "Macintosh Reference" manual that comes with it. In the index under "cleaning", there is an entry for the mouse (pages 294 through 296).

If cleaning the mouse as described in the manual does not correct the problem, the mouse may need to be replaced. Have a service technician check it.

This article last reviewed: 13 December 1990

TOPIC -----

I am writing medical-imaging software and want to connect two 19-inch monitors with different resolutions.

I have assumed that if one monitor has twice the resolution as the other, the object will be half the size on the higher-resolution monitor. Is there is a way, within the Macintosh OS or via a third-party utility, to have an object display the same size on both screens despite twice the resolution on one monitor?

DISCUSSION -----

The QuickDraw graphics model does not provide a mechanism that allows for display systems (card and monitor) with different dots per inch (dpi) resolutions to display an image at the same size. QuickDraw assumes a display system has a resolution of 72 dpi. This means that a 2-inch square (144 by 144 dpi) on a Macintosh Plus screen (72 dpi) will be an 2.09-inch square on the AppleColor High-Resolution RGB Monitor (69 dpi).

## OfficeVision and Macintosh Connectivity: PIXI

Revised: 1/28/91  
Security: Everyone

OfficeVision and Macintosh Connectivity: PIXI

=====

This article last reviewed: 13 December 1990

TOPIC -----

I am looking for information on Macintosh-to-OfficeVision connectivity.

DISCUSSION -----

There is a product for Macintosh-to-OfficeVision (and DISOSS) connectivity called PIXI (Personal Services Import Export) from IMI Computing. The product reportedly works in conjunction with DCA's MacIrma product. Its features include:

- Uploading and downloading Personal Services in-basket or filing cabinet entry(s) to the Macintosh. It also provides file transfer with both OfficeVision/MVS and Personal Services/CICS.
- Binary files can be transferred in native form for filing or distribution through Personal Services or DISOSS.
- PIXI MacIrma determines the document type as either RFT, EDITABLE, or PC FILE depending on the contents of the data. Macintosh ASCII files are automatically converted to EDITABLE if required. Macintosh RFT files are shared with other users unchanged (as RFT).

The product requires DCA's MacIrma hardware and APIs. On the host, you must also install the standard PIXI host component.

## Multiple System Files on One Macintosh: An Update (12/94)

Revised: 12/9/94  
Security: Everyone

Multiple System Files on One Macintosh: An Update (12/94)

=====

Article Created: 13 December 1990  
Article Reviewed/Updated: 9 December 1994

TOPIC -----

Under Macintosh Operating Systems 5.x and 6.x, multiple system files on a single volume virtually guaranteed file structure and performance problems. However, under 7.x it doesn't seem so demonstrable. Moreover, utilities like System Switcher suggest that there are now toggles to enable and disable a system file. I've seen a number of users who archive, sometimes deliberately, multiple system files on a volume, with or without such utilities. Are there known risks in doing this, and does Apple have a position regarding this practice?

DISCUSSION -----

We still recommend only one System Folder per volume. We are aware of some potential risks involved with multiple System Folders on one volume. They are:

- Confusion - It is very easy to become confused, either for the user or for a third party application, with the presence of more than one System Folder on the hard drive.
- Disk Cache - In rare instances, information in the Disk Cache may not get written to the hard disk before restarting. If you were blessing a System Folder before restarting, then your Macintosh may not recognize that it has a System Folder.
- Hard Disk Problems - In some instances, users have experienced low level hard disk directory problems, which were heightened by having multiple System Folders. In these cases, a Macintosh typically tried to load Extensions, Control Panels, and Preferences from an unblessed folder, and not from the blessed System Folder.
- Third Party Utilities - Third party utilities for blessing or unblessing multiple System Folders alter information in the hard disk directory's boot blocks. This is not supported by Apple and may cause problems.

If a user, for whatever reason, needs to have multiple System Folders, it is critical that the other System Folders be deblessed correctly, as follows:

- 1) With System 7.0 and later, move the System file to the Preferences Folder (hiding the System file in this way deblesses the System Folder).
- 2) Close the System Folder and verify its state before restarting. A blessed System Folder has a Macintosh in its icon. A non-blessed System Folder does not.
- 3) Rename the deblessed System Folder to any name other than "System Folder".

## Macintosh Chooser: How It Displays Names

Revised: 1/28/91  
Security: Everyone

Macintosh Chooser: How It Displays Names

=====

Article Created: 13 December 1990  
Article Last Reviewed: 30 July 1992  
Article Last Updated: 30 July 1992

TOPIC -----

I am designing some AppleTalk-based services and need to know how the Chooser "sorts" these items:

- 1) For a network "object" (like LaserWriter or AppleShare), the display of network resources accessible to you.
- 2) For a specific AppleShare server, the display of Volumes accessible to a user.

It appears that none of these lists is alphabetical (though life would be simpler for network designers if they were). I'm hoping that by better understanding how it DOES work, we can choose our assortment of network and volume names more intelligently so the appearance to users is more consistent.

DISCUSSION -----

- 1) For System 6 and earlier, the Chooser does not sort the names at all; they are displayed in the order that they are received by the NBP lookup request. Under System 7, the list is alphabetical.
- 2) At the server, devices are displayed in Finder order: startup volume first, followed by SCSI drives in descending order of SCSI address, followed by devices connected via the drive port in the order returned by the getVolInfo call. At the workstation, the devices are displayed in exactly the opposite order, with the startup volume at the bottom of the list.

## Macintosh Serial Port Voltage (12/95)

Revised: 12/2/95  
Security: Everyone

Macintosh Serial Port Voltage (12/95)

=====  
Macintosh Serial Port Voltage (12/95)  
Article Created: 13 December 1990  
Article Reviewed/Updated: 2 December 1995

TOPIC -----

I want to connect equipment to the serial port on a Macintosh IICx, but my product leaves a signal that's 15 volts high.

Is that too much? What is the maximum voltage that the modem or printer port can handle on the "receiving data" pin?

DISCUSSION -----

Engineering (and the manuals describing the receivers) indicates that the serial ports should be able to handle voltage ranges of +/- 25V.

The Quad Differential Line Receiver used on the Power Macintosh 6100, 7100, 8100, 9150 and the Quadra 630 family is rated to a maximum of +/- 25V on any differential input.

## Macintosh Portable: PDS Manual Correction

Revised: 11/30/92  
Security: Everyone

Macintosh Portable: PDS Manual Correction

Article Created: 1 February 1991

### Article Change History

10/29/92 - REVIEWED

- To indicate that problem has been corrected in the manual

### TOPIC -----

Is there a problem with figure 13-5 (a diagram of the Macintosh Portable 68000 Direct Slot) on page 280 of "Designing Cards and Drivers for the Macintosh Family"? In a real Macintosh Portable, the PDS connector is soldered on the board rotated 180 degrees.

I've heard the connector should be soldered as described in the book, which is the official way. Which one is correct, the book or the Macintosh?

### DISCUSSION -----

The manuals ("Guide to the Macintosh Family Hardware", second and third editions, and "Designing Cards and Drivers for the Macintosh Family", second edition) are in error. The signals and signal descriptions are correct, but the key for the slot is off by 180 degrees (that is, columns A and C should be swapped, as should be rows 1 and 32).

The manual "Designing Cards and Drivers for the Macintosh Family", third edition, has been updated and the Macintosh Portable PDS diagram has been corrected.

## HyperCard: HFSCopy External

Revised: 2/10/93  
Security: Everyone

HyperCard: HFSCopy External

=====

Article Created: 13 December 1990

### Article Change History

-----

09/01/92 - REVIEWED

- For technical accuracy

### TOPIC -----

I am developing a HyperCard front end for software distribution via AppleShare servers and using the HFSCopy XFCN to copy files from servers to users' hard drives. I have also made stacks that do validation and audit trails (including MS Mail API) and log the user onto the server, based on certain access privileges. After logging on the user has to drag down the folders from the server manually. This may have to be the solution if the stack can automate the "copy."

HFSCopy works great the first time, but the next time it is executed, it won't work with a duplicate folder name on the user's hard disk. Is there a simple solution to this? Or do I have to verify the user's folders every time and/or rename the existing folder to "<folder name> old" or something like that?

How can I use HFSCopy without knowing the name of the destination hard drive? I don't want to require users to enter the name of their hard drive or the script to search for the volume name. A wildcard does not seem to work. I would like HyperCard to do the HFS Copy to the HyperCard launch volume. HyperCard knows where it is being launched from, so I need to tell the script this information. How can I access this information?

### DISCUSSION -----

You're right: the HFSCopy XFCN does not replace a folder with the same name. It does, however, return an error that you can check, as a way to work around

this. Error -48 indicates a duplicate filename. You could write a script that uses a few XFCNs to index through the folder that you want to replace, deleting each of the files in the folder until the folder is empty, and then deleting the folder. Once this is done, you could then call the HFSCopy XFCN again, asking for the original folder. Because the folder no longer exists on your local disk, it will be copied successfully.

There are two XFCNs beyond HFSCopy that would help: FolderContents and DeleteFile.

The FolderContents XFCN returns the files and/or folders contained in a specified folder. Its syntax is:

```
FolderContents(Pathname, «,"Files"|"Folders"|"Both"» «"noDialog:"errorGlobal»)
```

where Pathname is a path to a folder to examine and parameter 2 is the literal string "Files", "Folders", or "Both".

This XFCN returns a carriage return delimited list (one file/folder per line) of all files, folders, or both files and folders (as per parameter 2) within the specified directory. The names of all folders will end in ":". The default is to list "both" files and folders. (The next version will be A/UX compatible.)

The third XFCN is DeleteFile, which deletes the file you specify. Specify the full pathname, as with the other two XFCNs. To delete a folder, that folder must be empty and you must trick the XCFN into thinking that the folder is a file. Therefore, delete everything in the folder, then call this XCFN once more using the folder name as a file name. In other words, where you would usually specify a folder name like "Hard Disk:folder1:", in this case, you omit the last colon and pass the parameter "Hard Disk:folder1". Thus, DeleteFile will think the folder is a file, and--as long as the folder is empty--will delete it. Remember that if there are folders within folders you must work your way from the deepest folder out, deleting files and folders as you go.

To get HyperCard's full pathname, use the HyperCard command "the long name of stack home". From the result, you can derive the information you need.

## A/UX: X Window System, MacX Performance Help (4/95)

Revised: 4/3/95  
Security: Everyone

A/UX: X Window System, MacX Performance Help (4/95)

=====

Article Created: 17 October 1990  
Article Reviewed/Updated: 03 April 1995

TOPIC -----

I am running some performance benchmarks on the A/UX implementation of the native X Window System and MacX. I cannot reproduce some favorable benchmarks that I read about in "Digital Review." I need some specific, concrete steps that I can take to optimize A/UX for running native X Window System applications as a client and server.

I'm running A/UX on a Macintosh IIfx with 8MB RAM on a Hammer 330MB drive (formatted with LaCie's Silverlining).

Also, is there anything I can do other than increase the memory or select "faster bitmap graphics" for the MacX performance benchmarks?

DISCUSSION -----

First, make sure that you are running the current release of "X Window System for A/UX". It includes "MacX for A/UX" and "Native X11 Window System for A/UX".

This software comes standard with A/UX 3.0. Here are some notes about these two products:

For "MacX for A/UX", the display server and the included "xcalc" client application are based on X11R3.

For "Native X11 Window System for A/UX", the display server and the "xstdcmap" client application are based on X11R4. The Xlib, the Xtoolkit, and other client applications are based on X11R3.

Because the Native X11 server for A/UX is based on X11R4, the performance behavior on the display server should be much improved over the X11R3 server.

To run X Window System with A/UX efficiently, some kernel parameters need to be adjusted, because of the number of processes and amount of memory space required

by both the display server and client applications in a network environment.

Use the command "kconfig -av" to display the current kernel parameters, and adjust these parameters, if necessary:

NBUF  
NFILE  
NINODE  
NPROC  
MAXUP  
NMBUFS

For an A/UX with 8MB RAM, the suggested values for these parameters are:

NBUF=1000  
NINODE=600  
NFILE=400  
NPROC=100  
MAXUP=100  
NMBUFS=1000

NMBUFS is allocated buffers for the network. You can adjust them, if necessary. The above can be done via the "kconfig -n /unix" command. Then use "sync;sync;sync;reboot" to effect the change.

For MacX, other than increasing the memory size of the MacX application (default is 1500K), we are not aware any other way to improve the performance. The suggested memory size of MacX is 2500K. Use "Get Info" to change the size under A/UX Finder.

If physical memory is your concern, you can use the "TBMEMORY" environment variable to increase your virtual memory under A/UX. For instance, to make a 16MB virtual memory, put these two lines in your .profile file, then logout and login to effect the change:

TBMEMORY=16m  
export TBMEMORY

## LaserWriter and LaserWriter II: How to Minimize Smudging

Revised: 2/5/91  
Security: Everyone

LaserWriter and LaserWriter II: How to Minimize Smudging

=====

This article last reviewed: 14 December 1990

TOPIC -----

I am seeing a lot of smudging with the LaserWriter and LaserWriter II printers in our office. What's wrong? What can I do to minimize this?

DISCUSSION -----

In most cases, smudging is due to the operation of the printer below the stated minimum 20 percent relative humidity. This often occurs in the winter when dry, cool air is brought inside and warmed up. Because of the latent humidity in the printer, paper, and toner cartridge, it takes approximately 24 hours for a change in humidity to reflect in the results. The condition of the printer, paper, and toner can all have a significant impact on the print quality. Changing parts or modules has no effect on a humidity-related problem.

Here are some suggestions for minimizing smudging:

- Use a humidifier in the vicinity of the printer and its paper. Try to maintain the humidity at a level of 40 to 70 percent.
- Place a moist sponge with the paper supply in a closed container (like sealed cabinet.) This does not control the humidity level within the printer or toner. This method, therefore, has limited effectiveness.
- Before inserting paper into the paper cassette, use a static-dissipating spray (e.g., Static Guard™.)
- Clean the printer regularly to reduce toner deposits in accordance with the "Owner's Guide" recommendations.

In conclusion, the best solution is to operate the printer within its specified humidity range.

## Using Shiva NetSerials to Manage Shared Serial Ports

Revised: 2/5/91  
Security: Everyone

Using Shiva NetSerials to Manage Shared Serial Ports

=====

This article last reviewed: 14 December 1990

TOPIC -----

I have a decent-sized AppleTalk network (40 workstations, two servers, bridge, and so on). I need to add about 10 share-able serial ports to bridge into an existing Wang system. Ideally, I'd like to find some device like a com-port server, something with up to ten ports, that would manage the allocation of the ports. I have considered using ten Shiva NetSerials, but I don't like the "trial and error" method of finding an available NetSerial. Does anyone make a device like this?

DISCUSSION -----

From your description it sounds as if you want a network communication "hunt group"-like service, that will automatically hunt for the next available communication server when the first communication server is busy. You can do this now with the Shiva NetSerials.

Just choose all of NetSerials you want in your "hunt group" through the Chooser and your call will be routed through whichever NetSerial is available. Because the NetSerial is an independent (after initial configuration) network device, you won't need to dedicate a computer to manage it.

For more details, search the Technical Info library under "Shiva."

## DBF Files: Accessing from Macintosh

Revised: 2/5/91  
Security: Everyone

DBF Files: Accessing from Macintosh

=====

This article last reviewed: 20 November 1990

TOPIC -----

Several people in my department are interested in using their dBASEIII+ or Clipper data files in the normal DBF file format by both MS-DOS users and Macintosh users. I'm thinking of solutions like FoxBASE+/Mac, dBFast/Mac, or 4th Dimension with dB\_Interface from CT-DATA.

Could you summarize all the possible solutions that we could implement? Some of these people are looking for solutions with the DBF files on a file server somewhere in the network. Others just want to take the DBF files and transfer them from a PC to a Macintosh. One of them is specifically interested in a HyperCard solution.

Are there any HyperCard externals available that make direct access to DBF files possible? Is there a similar feature like the dB\_Interface with 4th Dimension, for Omnis 5 from Blyth Software?

DISCUSSION -----

We have a number of suggestions on how to access DBF files from a Macintosh.

The first solution is, as you mentioned, FoxBASE+/Mac. FoxBASE+/Mac Multi-User works together FoxBASE+/LAN to allow concurrent operation on a network that supports both MS-DOS and Macintosh users. Data on the network is available to both machines at the same time, and access and manipulation operations are done identically. If you want to transfer DBF files from a DOS machine to a Macintosh, conversion is required. The index files for FoxBASE+/Mac are different, however. The first time you use an index in FoxBASE+/Mac on a DBF file from a DOS machine, a new index file will be created.

HyperCard can also be used as a front end to DBF files. Nittany Development Group has a product called DBF-Access Tools for HyperCard. This is a set of XCMDs for HyperCard used to import and export data in a variety of different

ways to and from DBF files. This is not multi-user, nor does it update any of the DBF index files. If data was exported from HyperCard to the DBF file, and you wanted to use dBASEIII PLUS with this DBF file again, you would need to reindex the database. Using DBF-Access Tools for HyperCard, the data in a DBF file could easily be read into HyperCard and manipulated.

Another HyperCard approach is a product called DashBoard from Symmetry. With DashBoard you can again read and write to DBF files. It updates the indexes of dBASE III files. Other applications, like FoxBASE or Clipper, will not have their indexes updated. This product is currently in beta form.

4th Dimension can access DBF files by using dBinterface Rapid from CTDATA. This is a set of externals for 4th Dimension that does high-speed, data conversion. Use it to move data between DBF files and 4th Dimension and the dBASE format. CTDATA also has a product called dBinterface Interactive. This gives you index support for DBF files and record-by-record access. It supports shared access via any AFP-compatible network, though the dBASE-compatible database must support multi-user access.

DbFast/Mac from Bumblebee Software will also read DBF files. This is a dBASE language development environment. It is a single-user database.

Finally, you can use Omnis 5 from Blyth Software. Omnis can import and export data from DBF files. The DBF files cannot be accessed by more than one user at a time, though. You can create a transaction where you import data, manipulate it, and then export the data back out to the DBF file. When exporting data from Omnis to the DBF files, the indexes are not updated.

People looking for multi-user solutions using DOS machines and Macintoshes at the same time should look into FoxBASE+/Mac and 4th Dimension using dB\_Interface from CTDATA. Converting data from DBF files on a DOS machine to a Macintosh is much easier, and you have quite a few options to choose from. The deciding point seems to be what application you want to run on the Macintosh.

## 80MB Hard Drive: External to Internal Conversion

Revised: 4/11/91  
Security: Everyone

80MB Hard Drive: External to Internal Conversion

=====

This article last reviewed: 11 October 1990

TOPIC -----

My 80MB external hard drive worked fine upon arrival. However, after I took it out of its case and made it an internal drive, it won't boot.

DISCUSSION -----

The modified drive is probably not terminated automatically. To see if this is the problem, put a SCSI system cable with a SCSI Terminator on the external SCSI port. If it boots with the external terminator, then you need to have the jumpers on the bottom of the drive set to terminate it. Contact your authorized Apple service provider for this.

A/UX: How to Share a LaserWriter with an Apollo Workstation

=====

This article last reviewed: 12 October 1990

TOPIC -----

I have a Macintosh II, Apollo workstation (with Interleaf), and a LaserWriter. What do I need to print Apollo files on the printer?

Also, what can you tell me about Information Technologies' UShare software for networking Macintoshes and Apollos?

DISCUSSION -----

One way to print Apollo files is to transfer the files to the Macintosh and then print from the Macintosh. To transfer files, make a direct, serial connection and then use Kermit or EtherNet and NCSA Telnet. The transferred files could then be printed.

UShare makes an AppleTalk board for the Apollo. With this board and Apollo host software, the Apollo becomes a host. Add print server software and you can spool files. You need the AppleTalk board for Apollo, UShare host software, and UShare print-server software. There is also an option for a mail program, if you need it.

## A/UX: How to Make an NFS File System Mount Automatically (9/94)

Revised: 9/7/94  
Security: Everyone

A/UX: How to Make an NFS File System Mount Automatically (9/94)

=====

Article Created: 15 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

My NFS file systems aren't mounting automatically.

DISCUSSION -----

Usually, one of two things cause this. The first is that the NFS entry in /etc/fstab is incorrect. To check this, follow these steps:

- 1) Log on as "root".
- 2) Edit the file /etc/fstab. This file lists all of the partitions which should be automatically mounted when the system is booted into multi-user mode.
- 3) As needed, add an entry for each NFS partition that you would like mounted automatically. The format needed is displayed in /etc/fstab:

```
rhost_1:/filename /mnt          ignore    rw        0 0
```

rhost\_1 is the name of the repote host. "filename" is the file system to be mounted. /mnt is the mount point, the directory to which the file system will be attached.

The other reason is that NFS file systems are mounted at startup only if the appropriate line has been altered in /etc/inittab. To see if yours is correct, follow these steps:

- 1) Log on as "root".
- 2) Enter the command:

```
grep mount /etc/inittab
```

You should see:

```
nfs8:2:once:/etc/mount -at nfs > /dev/syscon 2>&1
```

If this is not displayed, do these steps:

1) Edit the file /etc/inittab

2) Change the line

```
nfs8:2:off:/etc/mount -at nfs > /dev/syscon 2>&1
```

to

```
nfs8:2:once:/etc/mount -at nfs > /dev/syscon 2>&1
```

3) Save the file and quit the editor.

4) Shut the system down into single-user mode.

5) Bring the system back up into multi-user mode. The system will display the names of the local and NFS partitions as they are mounted.

The other reason that this happens is because you are in single-user mode. To find your run level, type

```
who -r
```

This should be displayed:

```
run-level 2 Apr 14 09:59 2 0 S
```

The number in the second column of the output should be a "2".

If it is an "S", your system is in single-user mode and must be booted into multi-user mode. To boot into multi-user mode:

1) Enter the command:

```
init 2
```

This will start the system booting into multi-user mode. During the booting process, it will ask if you'd like "the rest of the partitions" checked by fsck.

2) Press "Y" and Return.

When the system is up in multi-user mode:

1) Log on as "root".

2) Enter the command: df

The output will list all currently-mounted partitions, both local and remote.

## A/UX: Reasons Why NFS File Systems Don't Mount (9/94)

Revised: 9/7/94  
Security: Everyone

A/UX: Reasons Why NFS File Systems Don't Mount (9/94)

=====  
Article Created: 15 October 1990  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

My /etc/inittab, /etc/fstab are configured correctly, and I'm in multi-user mode, but my NFS file systems still don't mount.

DISCUSSION -----

There are two common reasons for this. The first is that the file /usr/etc/rpc.mountd is missing or corrupted. To check, enter the line:

```
ls /usr/etc/rpc.mountd
```

It should display:

```
/usr/etc/rpc.mountd
```

If it doesn't, the file /usr/etc/rpc.mountd must be restored from your backups or the A/UX CD-ROM.

A second reason is an incorrect entry in /etc/servers. To check this,

1) Log on as "root".

2) Enter the line:

```
grep mount /etc/servers
```

You should see:

```
rpc  udp  /usr/etc/rpc.mountd  100005  1
```

If you don't, follow these steps:

1) Edit the file /etc/servers by adding this line:

```
rpc    udp    /usr/etc/rpc.mountd    100005    1
```

2) Save the file and exit the editor.

3) Shut the system down into single-user mode.

4) Boot into multi-user mode. The names of the local and NFS partitions appear as they are mounted.

Security: Everyone

A/UX: Solution to "RPC\_MAP\_FAILURE" Error

=====

Article Created: 15 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I tried to mount a remote file system and got the error:

```
mount: <hostname> server not responding: RPC_MAP_FAILURE
```

### DISCUSSION -----

There are four, common reasons for this. First, check that you do not have an incomplete or marginal Ethernet connection. Follow these steps:

- 1) Are cables correctly seated on connectors?
- 2) Are cable in good condition physically? There should not be crimps or bends in the cable.
- 3) Check that all cables attached; make sure that none has been accidentally disconnected.

A second reason is that the remote host from which you are mounting a file partition may be down. Check with the administrator of the system. You will not be able to mount any file system from that system until the remote host is up and running.

A third reason is that the /etc/portmap daemon may not be running. Check this by following these steps:

1) Enter the line:

```
ps -ef | grep portmap
```

The output displayed should look like this:

```
root  90  1 0  Apr 25 ?          0:04 /etc/portmap
```

The numbers in the output may differ on your system. If you do not receive this output, do these steps:

1) Log onto the system as "root".

2) Enter the line:

```
grep portmap /etc/inittab
```

The output should look like this:

```
nfs0:2:wait:/etc/portmap
```

If it doesn't, edit the file /etc/inittab and modify it to look this way.

3) Shut the system down into single-user mode; run-level S.

4) Reboot the system into multi-user mode; run-level 2.

A fourth reason is that the /etc/portmap daemon on the remote host isn't running. To check this, follow these steps:

1) Log onto the system as "root".

2) Enter the command

```
rpcinfo -p
```

followed by a space and the name of the hostname you wish to check. You should get a list of registered program numbers. If you don't:

3) Shut the system down into single-user mode; run-level S.

4) Bring the system back up into multi-user mode; run-level 2.

## PLI's CD-ROM Drive Works with Macintosh and PCs

Revised: 2/11/91  
Security: Everyone

PLI's CD-ROM Drive Works with Macintosh and PCs

=====

This article last reviewed: 20 December 1990

TOPIC -----

Do you know of a CD-ROM drive that can connect to both a stand-alone PC and Macintosh?

DISCUSSION -----

Although computer-oriented CD-ROM periodicals list many such solutions, we haven't had ready access to most of them. We have tested the PLI CD-ROM drive and it worked as advertised:

"The PLI CD-ROM Drive is both compatible with the Macintosh and PCs; it reads CD-ROMs in all standard formats and plays audio CDs too. Headphone, analog, and digital audio output as well as external termination and SCSI ID switching are standard."

Check with computer dealers near you and read appropriate magazines for other products.

Macintosh IIsi/LC: Sound CDEV Problem and Fix

=====

Article Created: 20 December 1990  
Article Last Reviewed: 15 July 1992  
Article Last Updated:

TOPIC -----

If I open the Control Panel and select the Sound CDEV, then move the Control Panel window to the edge of the screen (either left or right), then click the "Add..." button to record a sound, the modal dialog window that opens is almost entirely off the screen. Because I'm unable to click a button to make this dialog go away, I'm stuck.

DISCUSSION -----

There is a problem with the Sound CDEV. The only configurations affected are:

Macintosh LC or Macintosh IIsi, running System 6.0.7 and MultiFinder  
(there is no problem under Finder).

Press Command-Period and you will return to the sound CDEV.

## Texas Instruments 928 Emulates VT320, VT220, VT52

Revised: 2/11/91  
Security: Everyone

Texas Instruments 928 Emulates VT320, VT220, VT52

=====

This article last reviewed: 20 December 1990

TOPIC -----

For a Macintosh user, is there a substitute for the Texas Instruments TI928 terminal?

DISCUSSION -----

The Texas Instruments TI928 terminal emulates VT320, VT220, and VT52 terminal types. It has RS-232-C and RS-423 capability and includes a printer port for a direct-connect printer.

Any Macintosh terminal emulation package capable of supporting the above terminal types should be a viable substitute for this terminal.

## Personal LaserWriter SC: Scaling Options Not User-Adjustable

Revised: 2/11/91  
Security: Everyone

Personal LaserWriter SC: Scaling Options Not User-Adjustable

=====

This article last reviewed: 20 December 1990

TOPIC -----

In the Personal LaserWriter SC print dialog, scaling options are presented as radio buttons in 25% increments. How can I choose some other scale, say 89%? Can I use someone else's drivers?

DISCUSSION -----

The scaling options provided by the Personal LaserWriter SC driver are hard-coded.

We don't know of any compatible third-party drivers for the Personal LaserWriter SC. Current drivers from other LaserWriters will not work; the Personal LaserWriter SC is not software-compatible with third-party printers.

Internet Router & 6.0.7: "Coprocessor not installed" error

=====

Article Created: 20 December 1990  
Article Last Reviewed: 8 October 1991  
Article Last Updated: 8 October 1991

TOPIC -----

I'm having a problem with System Software 6.0.7 and the AppleTalk Internet Router software 2.0. When installed on a Macintosh IIsi with a NuBus Adapter and a TokenTalk card (TokenTalk version 2.0 Arose Prep version 1.1) I receive a system error "Coprocessor not installed". When I install the Internet Router software on a Macintosh IICx, the system does not recognize the router software.

DISCUSSION -----

We tested the same configuration on a Macintosh IIsi acting as a router, and had no trouble installing or running the software.

We've heard complaints about the "Coprocessor not installed" message in varied situations with several different applications. Please see an article titled "Macintosh System Software 6.0.7: Troubleshooting (1 of 3) for more information on this error.

If you can't get the router software to run on the Macintosh IICx, there may be a problem with the way you're installing or configuring it. We recommend you start the installation from scratch using the correct system installer disks to install System software, and the Apple Networks Product installer disk to install the network drivers and the router software. The router should load successfully after re-installation in a clean system.

## LaserWriter 6.0.1: Defaults to Black and White (11/94)

Revised: 11/28/94  
Security: Everyone

LaserWriter 6.0.1: Defaults to Black and White (11/94)

=====

Article Created: 20 December 1990  
Article Reviewed/Updated: 28 November 1994

TOPIC -----

I want to change the default setting in LaserWriter 6.0.1 to black and white printing, because a customer does all of his printing is black and white. Can you help?

DISCUSSION -----

Without going into the code of the print driver, it is not possible to alter the default setting. Subsequent versions of the driver now default to Black and White. If you require this for your default, it is recommended that you upgrade to a later version of the driver.

## Chooser: Zone List Time-Out Values

Revised: 12/18/91  
Security: Everyone

Chooser: Zone List Time-Out Values

=====

Article Created: 4 January 1991  
Article Last Reviewed: 14 May 1991  
Article Last Updated:

TOPIC -----

I have 53 zones on the Northern Telecom Internet. It appears that the Chooser zone list display times out after approximately 40 zones have been displayed, when a single user is connected to the network at 2400 baud. (This timeout doesn't occur at 19,200 baud.) The site has a pair of Shiva TeleBridges and a pair of Hayes V Series 9600 V.42 modems on the network.

Can we use ResEdit to modify the Chooser's zone list time-out values?

DISCUSSION -----

Here is some information about the Chooser that may be of help.

When the Macintosh Chooser is opened, several things happen.

The Macintosh first sends a ZIP GetZoneList request to whatever AppleTalk router it has stored as its "A-ROUTER" value (the last router this Macintosh received an RTMP packet from).

The GetZoneList command is sent to the router with the zone list index set to 1. This tells the router to return the zone list to the requesting workstation, starting with the first entry.

The ZIP GetZoneList command is sent using the ATP at-least-once (ALO) protocol.

The time-out value used for the ATP request is set to 1 second; the number of retries for this transaction is set to 5.

The Macintosh sends out the GetZoneList command and expects to hear back

from a router within one second. This is reasonable, because the router is usually connected directly to the same cable that the requesting Macintosh is attached to.

The router replies to the GetZoneList command by sending a ZIP GetZoneList reply with the current zone list. If the zone list does not fit in one ZIP reply packet, the router indicates that there are more zones by setting a flag in the reply packet. The Macintosh requesting the zone list would then send another GetZoneList request to the router with the zone list index set to the number of the last zone name in the current reply packet plus one. This tells the router to then send the next chunk of zone names starting at index number X. A ZIP GetZoneList reply packet can usually hold around 40 zone names, but the exact number of zone names you will get into a single ZIP reply packet varies, depending on the length of the zone names themselves.

This may offer an explanation to why you have seen the symptoms you described.

The user opens the Chooser:

```
ZIP GetZoneList(index=1)      ----->    router
      wait 1 second
re-transmit 2nd attempt
ZIP GetZoneList(index=1)      ----->    router
      wait 1 second
re-transmit 3rd attempt
ZIP GetZoneList(index=1)      ----->    router
      wait 1 second
re-transmit 4th attempt
ZIP GetZoneList(index=1)      ----->    router
      wait 1 second
re-transmit 5th and last attempt
ZIP GetZoneList(index=1)      ----->    router

                                <-----    router responds with a GetZoneList()
                                with the more to come flag set.

ZIP GetZoneList(index=40)     ----->    router
      wait 1 second
                                no response
ZIP GetZoneList(index=40)     ----->    router
      wait 1 second
                                no response
ZIP GetZoneList(index=40)     ----->    router
      wait 1 second
                                no response
ZIP GetZoneList(index=40)     ----->    router
      wait 1 second
                                no response
ZIP GetZoneList(index=40)     ----->    router
      wait 1 second
                                no response
```

No response, so we give up and display the zones we've received so far in

the Chooser. The user ends up seeing only 39 zones.

In summary, if the router does not respond back to the first GetZoneList request within one second, we re-send the request. If, at the end of five requests, we still haven't received a reply, we give up and display no zone list in the Chooser window. If we receive the initial zone list, and the router has marked the "more to come" flag, we will request the next set of zone names with the same time-out and retry values as used previously (1 and 5). This is how you can end up with partial zone lists.

There is no easy way to change the retry or time-out values associated with this ZIP transaction. The AppleTalk protocol suite was developed to be used on a local area network where high reliability and low round-trip delays are prevalent. Apple has no plans to change or adopt the protocol to suit every physical data link on which AppleTalk may be implemented. Several third-party companies have developed products that push the AppleTalk protocol to its limits when used with their asynchronous or wide-area network products.

## A/UX: The network unreachable Remote Mount Error (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: The "network unreachable" Remote Mount Error (8/94)

=====

Article Created: 29 October 1990  
Article Reviewed/Updated: 25 August 1994

TOPIC -----

I tried to mount a remote file system and got the error:

network unreachable

DISCUSSION -----

This could be because the Ethernet card or cable connection is not working correctly. Here are four troubleshooting steps:

- 1) Make sure that the Ethernet cable from the Ethernet card to the rest of the network is connected and seated properly and snugly.
- 2) Check that there is not a broken connection in the main network cable itself.
- 3) Check that cables do not show any physical signs of damage. Ethernet cables should not be crimped, bent, or squished.
- 4) Replaced all cables that show excessive wear.

## A/UX: Diagnostics for a ping Error

Revised: 10/2/92  
Security: Everyone

A/UX: Diagnostics for a "ping" Error

=====

Article Created: 29 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

After executing ping on a remote Sun system, I got the error

```
ping:send to: network is down
```

and was logged off. I had all correct daemons running. When I run ruptime, it shows no systems up.

### DISCUSSION -----

Assuming that the systems were indeed up and running, do these diagnostic steps:

- 1) Reboot the system.
- 2) Check that cabling is correct.
- 3) Try another system to see if other systems can be seen.
- 4) Check that terminating resistors are in place.
- 5) Try reseating the Ethernet board. If that doesn't work, try a new board.
- 6) Check your IP address to see if it's valid.
- 7) Also, check your domain name.

## A/UX: Telnet and ftp in Problem Solved

Revised: 9/25/92  
Security: Everyone

A/UX: Telnet and "ftp in" Problem Solved

Article Created: 29 October 1990

### Article Change History

-----  
08/31/92 - REVIEWED  
o For technical accuracy.

### TOPIC -----

I have a Macintosh IIX and an EtherTalk board. Telnet and "ftp out" work fine. Telnet and "ftp in" cause the following messages on the screen:

```
ae0: overflow NIC reset failed
ae6_intr: receive overflow warning
```

### DISCUSSION -----

Don't worry about it. It appears only on very high-traffic networks and won't crash the system. You can reduce the frequency of messages by doing some network tuning. If you want, you can increase the number of NMBUFS in the kernel with

```
kconfig -n /unix.
```

You can list your kernel parameters with

```
kconfig -avn /unix.
```

--- WARNING ---

Whenever changing kernel parameters, be sure to save a known-good working /unix file to another name. You can then use this kernel as a backup in case you create a non-functioning kernel.

Security: Everyone

A/UX 2.0: What "who" Returns

=====

Article Created: 11 February 1991

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

When I do a who, it always says I am on console and on /dev/ttyp0.

### DISCUSSION -----

When you are using term (or Command Shell in 2.0), the multi-window terminal emulator, whoever launched term (or Command Shell in 2.0) is logged in on the console. The login windows generated by term (or Command Shell in 2.0) each have their own pttty (pseudo tty) port. That is why the who command shows two active login sessions even though only one person is actually using the system.

A/UX: When "kterm" Command Doesn't Connect

=====

Article Created: 29 October 1990

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

The "kterm" command doesn't connect on a particular Macintosh II through a serial line. This same Macintosh has faster displays than our other machines. The same software worked okay on other machines.

### DISCUSSION -----

Here are some general diagnostic steps:

- 1) Try clearing PRAM and then reset the serial ports (turn them off and then on again).
- 2) Try different ports on the network.
- 3) Check hardware and see if the motherboard has a problem.

## Two Mirrored Backup Products

Revised: 4/11/91  
Security: Everyone

Two Mirrored Backup Products

=====

This article last reviewed: 7 January 1991

TOPIC -----

Is there a mirrored backup capability for the Macintosh in the Reflections software from Profyle Computers, Ltd in Oxon, England.

DISCUSSION -----

Yes. For contact information, see the listing under "Profyle" in the Technical Info library. A similar type of backup utility was recently announced. Natural Intelligence publishes a product called Shadow that does automatic backup. They state that:

Shadow periodically copies the documents that have changed since they were last backed up. Shadow can backup onto any floppy disk, hard disk, removable disk, network server, or Finder-mountable tape drive.

Also, Golden Triangle has DiskTwin, a fault-tolerant, disk storage device for Macintosh II family computers. Golden Triangle states:

"DiskTwin is a Macintosh software package, facilitated by a proprietary NuBus add-in card, that automatically and transparently uses a second SCSI bus to make a real time copy of the contents of a primary hard drive onto a secondary hard drive. Technically, this operation is known as disk duplexing."

To the question "What is disk duplexing?", Golden Triangle responds:

"Disk duplexing is a technology today widely used in the mainframe and minicomputer world and in large microcomputer networks to ensure continuous operation. It is vital where end users simply cannot afford to lose any data or afford for a system to be down any amount of time. Now Golden Triangle uses proprietary software and hardware to bring this technology within economic reach of even a single Macintosh user."

Golden Triangle answers "How does DiskTwin work?" as follows:

"Drop the DiskTwin control panel device (CDEV) into your System Folder. Place the DiskTwin NuBus card into your Macintosh II. Attach a drive of the same kind as your primary disk onto the DiskTwin card. For example, if you have an Apple Quantum 80 internal, connect an Apple Quantum 80 external to the DiskTwin card. Restart your computer, and select the drive you want to twin. The twin is invisible to the Macintosh DeskTop, so it can't be used accidentally. When you do need it, you can immediately mount the twin onto the DeskTop from the DiskTwin CDEV. You won't even notice DiskTwin is working, so you can forget about it.

"But DiskTwin doesn't forget about you. DiskTwin runs continuously, creating a twin of your primary disk as often as you save to disk. Unlike software-only mirroring solutions, DiskTwin won't slow your system to a crawl. When your hard disk fails, mount the twin and you're back in business. Should the Macintosh SCSI hardware fail, your DiskTwin SCSI port remains operational."

## HyperCard: Dragging Over Text with Command Key Down

Revised: 2/12/91  
Security: Everyone

HyperCard: Dragging Over Text with Command Key Down

=====

Article Created: 08 January 1991  
Article Last Reviewed: 4 June 1992  
Article Last Updated:

TOPIC -----

In HyperCard, when I hold down the command key while the pointer is over a text field (it doesn't matter whether the field is locked), the pointer changes from an insertion point to a hand. If I then drag this hand pointer over the field (still holding down the command key), up to one entire line of text is immediately copied into the message box. What is this feature called and what is it for?

DISCUSSION -----

This feature has been a part of HyperCard for some time, but is not documented. Here's one way to take advantage of it:

You can write a handler that builds a find command in the message box, then "types" return to execute the command. For example, here's a handler that finds the next occurrence of whatever text has just been copied into the message box:

```
on mouseUp
  put "find whole"&&quote&message&quote into message
  repeat 2
    -- The first find will be the text you just copied into the message box;
    -- the second find will be the next one, if any.
    type return
  end repeat
end mouseUp
```

Each time you then press the return key (without changing the content of the message box), you'll go to the next occurrence of the same search string.

## HyperCard 2.0: Bypassing Dialog Boxes

Revised: 2/12/91  
Security: Everyone

HyperCard 2.0: Bypassing Dialog Boxes

=====

This article last reviewed: 08 January 1991

TOPIC -----

When I use certain HyperCard 2.0 commands, either from the menu bar or from a script, I get a dialog box that must be responded to. Examples:

| command         | dialog box              |
|-----------------|-------------------------|
| -----           | -----                   |
| Import Paint... | Import Paint from...    |
| Export Paint... | Save Paint document as: |

Is it possible to execute these commands from scripts, or from the message box, without having to respond to the dialog boxes? And is it possible to open a stack in new window from a HyperTalk script, also without dealing with a dialog box?

DISCUSSION -----

Here are some commands that do what you want. In the examples, "stackname" represents either a stack name, or the path to a given stack.

The first one imports a bitmap from the specified MacPaint file to the card picture. It starts with the top-left corner of the MacPaint file, and clips to HyperCard's current card size. It requires that one of HyperCard's paint tools (such as the line tool) is first chosen.

```
choose line tool
import paint from file "stackname"
```

The next one creates a new MacPaint file, to which it exports the card image. This is the equivalent of doing a screen dump from HyperCard, but you get to choose the name of the output file in advance.

```
choose line tool
export paint to file "stackname"
```

Here's a command that opens a specified stack in a new window:

```
go "stackname" in new window
```

And one that creates a new stack and gives it a name:

```
create stack "stackname" <with backgroundname> <in new window>
```

The card size of the current stack becomes the card size of the new stack. If no background is specified, the new stack is created with a blank background. Otherwise, a copy of the specified background becomes the background of the new stack. If "new window" is specified, the new stack is created in a new window -- in other words, the old card window remains on-screen.

This one saves a copy of the specified stack under the new name you specify in advance:

```
save stack "stackname1" as "stackname2"
```

## Apple IIe Card: Hardware Specifications (7/93)

Revised: 7/12/93  
Security: Everyone

Apple IIe Card: Hardware Specifications (7/93)

Article Created: 7 March 1991

### Article Change History

-----  
07/12/93 - REVISED  
    • To include Performa  
06/08/92 - REVIEWED  
    • For technical accuracy

### TOPIC -----

This article gives the specifications for the Apple IIe Card for the Macintosh LC and Performa 400, 405, 430, and 450 computers. For a description of the Apple IIe Card software, search under "Apple IIe Card" and "software".

### DISCUSSION -----

#### OVERVIEW

-----  
The Apple IIe Card lets the Apple Macintosh LC computer and Performa 400 series run the more than 10,000 Apple IIe programs. To assure compatibility with virtually all Apple IIe applications, the Apple IIe Card contains a 65C02 microprocessor -- the same one that's built in to the Apple IIe personal computer. The card comes with 128K RAM standard and can use up to 1MB of Macintosh LC RAM. A floppy-drive controller and connector ports for a 5.25-inch floppy disk drive and an Apple Joystick II are also included.

The Apple IIe Card takes full advantage of the Macintosh LC Performa 400 series' components, including the monitor, keyboard, mouse, and internal disk drives. With the superior resolution offered by Macintosh monitors, text and graphics generated by Apple IIe applications appear crisp and clear in all Apple IIe video modes. Regardless of the video mode, Apple IIe applications run at normal Apple IIe speeds -- or, using an optional mode of

the Apple IIe Card, they can be run up to twice as fast.

## SPECIFICATIONS

### Central Processing Unit

- Processor: 65C02
- Clock Speed: 1.02MHz or 1.9MHz
- Address Bus: 16 bits
- Address Range: 2 banks of 65,536 bytes (128K total)
- Data Bus: 8 bits - Registers: Accumulator, two index registers, stack pointer, processor status, and program counter

### Memory

- 256K of RAM (Apple IIe uses 128K of this RAM) on Apple IIe Card
- Ability to access up to 1MB of Macintosh LC RAM
- Apple IIe ROM in write-protected portions of Apple IIe Card memory

### Text Display Modes

- 80 columns, 24 lines, 5x7 dot matrix
- 40 columns, 24 lines, 5x7 dot matrix
- All text can appear on the screen as normal, inverse, or MouseText characters

### Graphics Display Modes

- Low-resolution color: 16 colors, 40x48
- High-resolution color: 6 colors, 280x192
- Double high-resolution color: 16 colors, 140x192
- Double high-resolution monochrome: 560x192

### Compatible Operating Systems

- ProDOS
- DOS 3.3
- Pascal

### Drives Supported

- Two Apple 5.25 Drives (Platinum 5.25 Drive is the only 5.25-inch drive supported)
- One UniDisk 3.5 Drive (White 3.5-inch external)
- Internal SuperDrive

### Monitors Supported

All Macintosh LC monitors are supported (12- and 13-inch)

## A/UX: How to Copy Eschatology Partition

Revised: 11/9/92  
Security: Everyone

A/UX: How to Copy Eschatology Partition

Article Created: 12 February 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I need to copy an A/UX system from one drive to another, but I have a problem with the A/UX Eschatology partition. I set up the partitions on the new drive as on the first drive, except for some free space, which I have configured as usr space. I did a dd copy of the root partition.

I then hoped that by doing an eupdate I would be able to update the Eschatology partition. When I try this (I am able to boot from the new drive without any problem), I get messages about the inability to mount s3 and attempt to unmount slice 3. (I have not defined any slice 3.) Further messages refer to typewriter problems and the like.

What is the problem? Why is eupdate attempting to mount a slice that doesn't exist?

### DISCUSSION -----

From what you described above, you copied only the root file system. You did not copy the Eschatology partition to the new drive. To copy the Eschatology partition, do the following (assuming X is the source disk SCSI ID and Y is the target disk SCSI ID), and assign slice 3 for the Eschatology partition:

```
# pname -cX -s3 "Eschatology 1"
==> /dev/dsk/cXd0s3
# pname -cY -s3 "Eschatology 1"
==> /dev/dsk/cYd0s3
```

```
# dd if=/dev/dsk/cXd0s3 of=/dev/dsk/cYd0s3 bs=20k
# pname -u /dev/dsk/cXd0s3
# pname -u /dev/dsk/cYd0s3
```

Then, you can issue the "eupdate" command, which updates /unix and network files like /etc/HOSTNAME, /etc/NETADDRES, ... for Eschatology partition. Make sure that before doing "eupdate" that the Eschatology partition is not pnamed or mounted, because the "eu" program automatically does all the "pname", "pname -u", "mount", and "umount" on the Eschatology partition.

You might have got the error message from "eupdate", because the Eschatology partition was still pnamed or mounted. "umount" and "pname -u" the Eschatology partition and do "eupdate" again. Other similar error message like

```
Can't mount...:No space left on device
```

might occur if the Eschatology file system is almost full. In that case, remove some of the files like /mnt/unix from the Eschatology file system and do "eupdate" again.

To remove file(s) from the Eschatology partition, you have to "pname" and "mount" the Eschatology partition first. For example, to remove "unix" from Eschatology partition then "eupdate":

```
# pname -cY -s3 "Eschatology 1"
==> /dev/dsk/cYd0s3
# mount /dev/dsk/cYd0s3 /mnt
# rm /mnt/unix
# umount /dev/dsk/cYd0s3
# pname -u /dev/dsk/cYd0s3
# eupdate
```

## A/UX 2.0 ftime() and open()

Revised: 9/16/92  
Security: Everyone

A/UX 2.0 ftime() and open()

Article Created: 7 January 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I am doing some A/UX 2.0 benchmarks and am having problems in two areas that involve C code. First, I need the equivalent of the ftime function on a Sun for timing execution time. The second is how to do a synchronous write to disk. The usual "write (o\_sync)" command doesn't seem to be working.

### DISCUSSION -----

- 1) As far as we can tell, the ftime() function call that appears in most BSD UNIX systems (including Sun UNIX) is obsolete and now replaced by the gettimeofday() function call. A/UX has gettimeofday() but not ftime().

From the structure returned by ftime() and the new structures used by gettimeofday(), it should not be difficult to use the new gettimeofday() instead of the obsoleted ftime(). The structure returned by ftime() is defined in <sys/timeb.h> of BSD UNIX as:

```
struct timeb
{
    time_t      time;
    unsigned short millitm;
    short       timezone;
    short       dstflag;
};
```

The structures used by gettimeofday() are defined in <sys/time.h> as:

```
struct timeval {
    long    tv_sec;      /* seconds since Jan. 1, 1970 */
    long    tv_usec;     /* and microseconds */
};

struct timezone {
    int     tz_minuteswest; /* Greenwich */
    int     tz_dsttime;     /* type of dst correct to apply */
};
```

2) To do a synchronous write to DISK, the fsync (2) system call should be used after the write(2) or writev (2) system call. The fsync (2) system call causes all in-core copies of buffers for the associated file to be written to a DISK. See fsync (2) manual page for more information.

Note that the use of the O\_NDELAY and O\_NONBLOCK flags in the open() system call for controlling I/O applies only to FIFOs and communication lines like tty's. See open (2) manual pages for more information.

## Macintosh and CD-I Development (11/94)

Revised: 11/7/94  
Security: Everyone

Macintosh and CD-I Development (11/94)

Article Created: 12 February 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I am interested in using the Macintosh to develop CD-I (compact disc interactive) applications. What can and cannot be done in this field?

- Is there a CD-I compatible player for the Macintosh?
- How would one develop an animation on the Macintosh and then transfer it to CD-I?
- Can sounds be created and manipulated on the Macintosh and then used on the CD-I?

DISCUSSION -----

Currently, Macintosh is being used as a front-end device for assembling certain elements of CD-I. This is about the extent of what can be done with the Macintosh. Since the CD-I system is an alternative computer system to the Macintosh, we cannot duplicate a CD-I system exactly without accommodating the OS9 operating system.

The video portion of CD-I is compressed from analog video sources. Thus, preparing Macintosh animations for this format is the same as preparing animations for videotape. Using a program like MacroMind Director and an NTSC output video NuBus card, and recording the output onto videotape, would be the simplest way to provide video.

The quality of the compressed video coming from the CD-I compression methods is low compared to VHS tape. Generally, the playback of the video is around 12 frames per second for one quarter screen. The proposal provides for only 30,000 colors in the video image--far short of the Macintosh 24-bit capability.

Because CD-I uses digital audio, digital audio products from companies like

Digidesign and New England Digital can be used for mastering the audio portion of the CD-I system. However, this master audio would then need to be sent through the CD-I compression method.

## ADB Detection of TTL Signals for Network Shutdown (1/95)

Revised: 1/6/95  
Security: Everyone

ADB Detection of TTL Signals for Network Shutdown (1/95)

=====

Article Created: 12 February 1991  
Article Reviewed/Updated: 6 January 1995

TOPIC -----

I'm looking for an ADB device that lets me monitor at least three TTL signals and control one TTL signal. I want to implement a Macintosh program that will handle a number of uninterruptible power supplies (UPSs). The intention is that the program can shut down a Macintosh network gracefully.

Using an ADB device will free a serial port from being dedicated to monitoring a few lines for a change of state. Is there a device able to handle the above TTL signals?

DISCUSSION -----

We have not been able to find an ADB-based product that has these abilities. The Apple Desktop Bus is typically used for products such as keyboards, trackballs, mice, and so on, and it isn't likely that someone has worked on something of this nature.

TOPIC -----

Can the Macintosh Portable be charged from a 12-volt battery?

DISCUSSION -----

Yes. One product that makes this possible is the Automobile Power Adapter from Lind Electronic Design. As we understand it, with the Adaptor, you can operate a Macintosh Portable while charging its battery from the 12-volt DC battery in an automobile, van, or boat. The adapter unit contains a voltage regulator and current-limit circuits that ensure safe computer operation and battery charging from a mobile power source. Lind includes cords for an automobile cigarette lighter and for the computer's power adapter jack with the adapter.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## AppleShare PC and LaserWriter Drivers

Revised: 2/13/91  
Security: Everyone

AppleShare PC and LaserWriter Drivers

=====

This article last reviewed: 30 November 1990

TOPIC -----

I installed AppleShare PC 2.01 on a PC on a mixed LocalTalk network. The Macintoshes in the workgroup use LaserWriter drivers version 6.0.1. It seems that AppleShare PC is not compatible with these drivers, and we get LaserWriter wars. Is there a fix or workaround?

DISCUSSION -----

While the Macintosh LaserWriter drivers require a PostScript dictionary to be present in the LaserWriter, AppleShare PC does not. Printing from AppleShare PC to a LaserWriter connected as a PostScript device doesn't download anything other than the file being printed.

It does download an Epson emulation dictionary for each Epson job, but this persists only for the length of that job. It does not require or replace md (The Macintosh Laser Prep dictionary), and, therefore, won't cause any LaserWriter wars.

Theoretically, PC application that prints PostScript can wipe out md, or download its own dictionary that conflicts with 6.0.1. This is entirely dependent on the applications being used and could be tested by printing from each in turn until a conflict occurs.

We would first confirm that all of the Macintosh computers have LaserWriter and Laser Prep 6.0.1 installed. If so, check to see if one of the PC applications is causing the problem.

## A/UX: AppleTalk lpr Problem (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: AppleTalk "lpr" Problem (9/94)

=====

Article Created: 13 February 1991  
Article Reviewed/Updated: 8 September 1994

TOPIC -----

At the UNIX prompt, I type: lpr /etc/hosts

The file does not print, and I repeatedly get the following messages on the console:

```
/usr/spool/lpd/AppleTalk/ofilter: pipe: cannot open
/usr/spool/lpd/AppleTalk/ofilter: pipe: cannot create
```

I guess I should add that the lpr command uses the default entry in /etc/printcap file. In the unmodified version (as distributed) it is the AppleTalk entry, which should print on whatever printer is currently selected by the Chooser.

DISCUSSION -----

To let the AppleTalk printing service run correctly under the A/UX BSD printer spooler (/usr/lib/lpd, lpr, ...), the following files under each printer directory (for example /usr/spool/lpd/AppleTalk) should be owned by user "daemon" and group "daemon":

|            |   |        |        |         |
|------------|---|--------|--------|---------|
| drwxrwxr-x | 2 | daemon | daemon | .       |
| drwxrwxr-x | 7 | daemon | daemon | ..      |
| -rwxr-xr-x | 3 | daemon | daemon | ifilter |
| -rwxr-xr-x | 3 | daemon | daemon | ofilter |
| -rwxr-xr-x | 3 | daemon | daemon | nfilter |
| prw-rw---- | 1 | daemon | daemon | pipe    |

The error message "...: pipe: cannot open" most likely indicates that the ownership or groupship of any of the above files might have been incorrectly set. Check yours, correct them, then restart the "lpr" command.

Because "lp" is the default printer in the BSD printer spooler system, the "lp|at|AppleTalk" entry in /etc/printcap is chosen by the printer daemon (/usr/lib/lpd). /usr/lib/lpd then passes all input file(s) to be printed to a remote PAP (Printer Access Protocol) server for printing. This is done by the input/output filter programs (ifilter, ofilter) provided under individual printer directory (/usr/spool/lpd/AppleTalk), which is in turn invoked by the "atprint" program which directly copies data to a remote PAP server.

Under "lpr", the destination PAP server is chosen as follows:

If the -Pprinter option of "lpr" command or the environment variable PRINTER is used or set, then the output goes to a specific printer. Otherwise, the system-wide default printer, the "lp" entry in /etc/printcap, is chosen, which is also the AppleTalk printer. The default AppleTalk printer is then chosen via the Chooser, from the Control Panel, or through the at\_cho\_prn utility.

We assume that you have correctly configured and set the AppleTalk in A/UX kernel.

## A/UX 2.0.1: General Information

Revised: 2/11/93  
Security: Everyone

A/UX 2.0.1: General Information

=====

Article Created: 13 February 1991

### Article Change History

-----

01/15/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

A/UX 2.0.1: General Information

### DISCUSSION -----

A/UX 2.0.1 is an incremental upgrade release to A/UX 2.0. It was produced primarily to add support for the Macintosh IIsi. A/UX 2.0.1 runs on all Macintosh models that support A/UX. There is no CD version of the upgrade, however there is a CD available that contains the full A/UX 2.0.1 release

### Benefits and Features

- 
- Supports the Macintosh IIsi (with FPU installed)
  - Supports multiple monitors on one Macintosh via the "Monitors" CDEV
  - Supports adjustable mouse tracking via the "Mouse" CDEV
  - Includes MacX 1.1
  - Includes new version of the awk programming language
  - Includes new version of the Korn shell, ksh-88
  - Supports Macintosh System Software 6.0.7
  - Is IEEE standard POSIX 1003.1-1990-compliant
  - Includes version 5.65 of sendmail
  - Includes changes to the A/UX header files, which provide function prototypes and ANSI symbol definitions for third-party ANSI C compilers
  - Has asynchronous serial support

- Supports the use of function keys in CommandShell
- Mounts Macintosh HFS CD-ROM volumes to the desktop while logged in

#### CD-ROM Note

-----

To properly operate an AppleCD SC, the Apple CD-ROM INIT must be installed in the System Folder of the Macintosh startup volume, and the AppleCD SC must be powered on at startup.

## Macintosh Classic Disk Errors May Be WDEF Virus

Revised: 6/18/92  
Security: Everyone

Macintosh Classic Disk Errors May Be WDEF Virus

=====

Article Created: 21 January 1991  
Article Last Reviewed: 22 July 1992  
Article Last Updated:

TOPIC -----

We have seen some strange error messages when inserting 800K diskettes, which have been formatted in a Macintosh SE or Macintosh Plus, into a Macintosh Classic. When the disk icon appears on the desktop, and the user double-clicks on it, errors like "this is not a Macintosh Disk", "Error reading this diskette", and "Address error" appear.

DISCUSSION -----

We have had reports of a variety of problems when users double-click on icons. The only situation that has been reproducible was traced back to the WDEF virus. Apparently, the WDEF virus causes this problem with System 6.0.7. (In earlier version of the system software, WDEF could be in the system, yet not create any major problems.)

Our suggestion is to use Disinfectant 2.4 or higher, or any of the other virus protection programs on the market, to check the Macintosh Classic for WDEF and eliminate the virus.

## A/UX and 5.25-Inch Floppy Drives (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX and 5.25-Inch Floppy Drives (8/94)

=====

Article Created: 21 January 1991  
Article Reviewed/Updated: 25 August 1994

TOPIC -----

Is there a 5.25-inch UNIX floppy drive that can be used with A/UX? A customer, who is interested in A/UX, must be able to read floppies from a 386 SCO/UNIX machine with 5.25-inch floppy drives.

DISCUSSION -----

We know of no 5.25-inch UNIX floppy drives for A/UX.

Dayna Communication has a 5.25-inch floppy drive for the Macintosh OS that recognizes MS-DOS format only.

The 5.25-inch floppy drive in HFSI's (Honeywell Federal Systems Inc.) WIS A/UX workstation, works only under A/UX 1.1.

## Apple Pascal 1.3: Startup Slot

Revised: 2/13/91  
Security: Everyone

Apple Pascal 1.3: Startup Slot

=====

This article last reviewed: 21 January 1991

TOPIC -----

What is the memory location for the slot number of the drive that Apple Pascal starts up from? How can I change that information or location so the computer will think it was booted from the RAM disk (to which I've already copied the appropriate system files)?

DISCUSSION -----

The internals of Apple II Pascal are proprietary and confidential and we cannot divulge such information.

However, it is possible to completely load Apple II Pascal into an Apple II RAM Expansion card and start up from it. Here's how:

- 1) Once you have started Apple Pascal and you are at the command line, type F(ile.
- 2) At the second command line, type V(ols. Write down the volume number with 2048 blocks. This is your RAM Expansion Card volume number.
- 3) Format the RAM Expansion Card. Type Q(uit and then X(ecute. This will prompt you for a file name. Type "Formatter" and press Return. Formatter will ask you for a volume to format: type the volume number you wrote down in step 2, and press Return.
- 4) Do a wild card copy of all the files on Volume 4 to the volume number of your RAM Expansion Card. Type F(ile then T(rans. When you're asked "Transfer What File?", type "#4:=" and press Return. At the "to where?" prompt, type your RAM Expansion Card volume number followed by ":= " and press Return.
- 5) When the copying is finished, make your RAM Expansion Card the startup

## ..TIL06596-Apple\_Pascal\_1-3-Startup\_Slot\_(TA45092).pdf

volume. Type Q(uit followed by another Q and Y. Finally, type Control-Reset.

- 6) At the Applesoft BASIC prompt, type "PR#" followed by the slot number of your RAM Expansion Card. Pascal should start up.

Apple Pascal supports a maximum of 128K RAM for system memory use, and the remaining RAM may be used as a RAM disk only.

## Macintosh IIsi/IIci/LC Built-in Video: No NTSC Output (11/94)

Revised: 11/7/94  
Security: Everyone

Macintosh IIsi/IIci/LC Built-in Video: No NTSC Output (11/94)

=====

Article Created: 12 February 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

Can I display the Macintosh LC's output on an NTSC monitor? I looked into RGB-to-NTSC converters and found that the RasterOps Video Expander only works off a NuBus display card. My guess is that ComputerVideo's Video NTSC Encoder works the same way.

I know you can make a cable to pull black and white NTSC off Macintosh display cards. Given that, is there a way to pull NTSC off the built-in video on a Macintosh?

DISCUSSION -----

While you can generate an RS-170 signal by shorting together pins on Apple's NuBus video cards, an NTSC compatible (not NTSC standard) signal cannot be generated by the built-in video ports of the Macintosh IIci, Macintosh IIsi, or Macintosh LC.

Lapis Technology produced a video adapter to allow the Macintosh LC to generate NTSC compatible video. Contact them for further information on pricing and availability.

## Videotaping Apple RGB Monitor in PAL

Revised: 2/13/91  
Security: Everyone

Videotaping Apple RGB Monitor in PAL

=====

This article last reviewed: 22 January 1991

TOPIC -----

Is it possible to videotape the Apple RGB monitor using a professional PAL video camera and VideoSync?

DISCUSSION -----

Here's one solution:

- 1) Use VideoSync, and set it to stable scan rate.
- 2) Tape with a Sony BVP-7 professional Betacam SP PAL video camera.
- 3) Set the camera's built-in shutter to 1/100.

The picture should be quite stable. The only drawback is a very slight loss of exposure due to the shorter exposure time using the shutter.

## VMS ENQLM Quota Requirement for DAL/VAX/Rdb

Revised: 6/29/92  
Security: Everyone

VMS ENQLM Quota Requirement for DAL/VAX/Rdb

=====

Article Created: 26 February 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

### TOPIC -----

I have problems while trying to use DAL with VAX/Rdb. I'm using DAL 1.2 (from DEC LanWORKS for Macintosh) with VAX/Rdb 3.1 under VMS 5.3. My connection (and associated processes) were killed when I try to use the IDAL utility with an account different than SYSTEM (or a copy of it). Some commands worked, (like DESCRIBE DATABASES) and some others (like SELECT) ended up with the connection terminated. I experimented and found that the solution was to set the ENQLM parameter for the user to a minimum value of 250.

I did not find any information about this in my documentation, and I know it's not a VAX/Rdb problem, because I can use VAX/Rdb SQL\$ utility with the same ENQLM value without any problem. I have been able to reproduce the same problem on two CPUs, one MicroVAX 2000, and one 3300.

### DISCUSSION -----

As you might already know, on VMS, the Enqueue Quota (ENQLM) limits the number of locks a process (and its subprocesses) can own. VAX/Rdb uses RMS, which in turn uses the Lock Management Facility, to synchronize shared file access. One lock is used for every shared file, local buffer, global buffer section, and outstanding record lock. Users doing large amounts of file sharing should set the ENQLM to a large value. Typically, this number is recommended at 200. The DEFAULT account ENQLM is set at 100, so all accounts begin with a limit of 100 unless explicitly changed.

It is understandable why you need to increase ENQLM when selecting a large number of records from a database. Commands like DESCRIBE DATABASE do not require many locks and, therefore, worked with the low ENQLM. We don't

know why Rdb SQL\$ utility worked except for the speculation that IDAL might add the extra locking.

DAL support engineering told us that although they do not specify account quota requirements, in the documentation, they recommend changing user accounts quota to the VAX/Rdb requirements. The following are from VAX Rdb/VMS Installation Manual:

BYTLM (Byte Limit): at least 18,000 bytes  
FILLM (Open File Quota): around 50 is an acceptable value  
ENQLM (Enqueue Limit): at least 600 locks

The account should also have TMPMBX privilege.

## A/UX: cpio Does Not Support Symbolic Link Backups (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: "cpio" Does Not Support Symbolic Link Backups (8/94)

=====

Article Created: 10 January 1991  
Article Reviewed/Updated: 25 August 1994

TOPIC -----

I have a question about cpio. I'm trying to back up the Macintosh System Folder under A/UX and the following command will back up only the unique files in the folder. The main problem is that an symbolic links in that folder do not get backed up.

Here is the command I'm using from the Command Shell:

```
cd /mac/sys/"System Folder"  
ls -a | cpio -ovF > /dev/rfloppy0
```

This command installs the unique files on two successive floppies, but ignores the others. How can I get these files to be recognized by the cpio command?

DISCUSSION -----

Symbolic links are analogous to aliases in the Macintosh OS. Neither the "cpio" nor "tar" commands under A/UX back up symbolic links. Rather, they copy only the symbolic names, not the actual data files.

In this case, you also need to copy the directories (/mac/lib/SystemFiles, for example) that contain the actual data files.

## MacX and X Window System for A/UX Are ICCCM Compliant (9/94)

Revised: 9/22/94  
Security: Everyone

MacX and X Window System for A/UX Are ICCCM Compliant (9/94)

Article Created: 10 January 1991  
Article Reviewed/Updated: 22 September 1994

TOPIC -----

Is the MacX v1.0 server and X Windows for A/UX ICCCM compliant?

DISCUSSION -----

ICCCM stands for "Inter-Client Communication Conventions Manual." Yes, MacX and X Window for A/UX are both ICCCM compliant. Most of X11R3 and later client applications and Window Managers are designed to meet the ICCCM conventions. The ICCCM really has nothing to do with the X server; the convention is to make sure that all applications running X cooperate properly with the Window Manager and share the system resources politely.

Although MacX is a server, it has a built-in Window Manager, the functionality of which is designed to conform to the ICCCM conventions.

Macintosh IIsi: Use Excel 2.2a or Later

=====

Article Created: 10 January 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated:

TOPIC -----

The Macintosh IIsi bombs when trying to use Excel 2.2. Does System 6.07 fix the problem? Is there a way to trick the Macintosh IIsi so that it doesn't assume it has a math coprocessor and lets you run Excel?

DISCUSSION -----

There are known problems with Excel versions prior to 2.2a running on the Macintosh IIsi. Microsoft knows of the problem and suggests that affected customers upgrade to 2.2a or higher.

System 6.0.7 does not fix the problem with Excel, but is required for the Macintosh IIsi anyway. Be sure that you are using System 6.0.7 before troubleshooting further.

There is a way to make older versions of Excel ignore the FPU, or in the case of the Macintosh IIsi, not look for what isn't there. Hold down the Command, Shift, and Option keys at launch time (when double-clicking the Excel icon).

## Teradata Database Does Not Support DAL Access

Revised: 6/30/92  
Security: Everyone

Teradata Database Does Not Support DAL Access

=====

Article Created: 26 February 1991  
Article Last Reviewed: 30 June 1992  
Article Last Updated: 30 June 1992

TOPIC -----

I have a Teradata Database Server (Model 1012) attached to an IBM Host Environment running VM/CMS.

I've been involved in a few VAX VMS DAL installations, but never one on the IBM side. What pieces are needed for the Macintoshes to be able to access the Teradata DBMS through the IBM Host?

My guess is:

- A Macintosh Client DAL Application or DA (ClearAccess, WingZ, HyperCard, and so on).
- On the Host, DAL for VM/CMS.
- A product called EQT.
- 3270 support on the workstation (IRMA, Avatar, Tri-Data, and so on).
- Correct 3270 API to support the hardware used.

That's where I am confused. EQT lets you do SQL queries through DAL on an IBM Host. Because Teradata is not one of the "supported" databases (Ingres, Informix, Sybase, and so on), it requires its own adapter. Is this correct?

If I go with the EQT Product, do I even need DAL on the Host? If EQT supports DAL, can I use products like WingZ to access?

DISCUSSION -----

Before we answer your questions, let's look at what EQT does:

EQT (Executive Query Tool) is a Query Tool developed by Red Brick Systems. It provides point-and-click access to relational databases, regardless of workstation platform, the database server, or the server hardware. It runs on Macintosh and DOS Windows. Future releases will run on OS/2 Presentation Manager, and on UNIX workstations. It can retrieve data from Teradata, Oracle, Ingres, Sybase, DB2, Informix, and Rdb databases.

EQT for CL/1 is an old name for an announced product called Claris Query Tool which uses three mechanism to access databases: Data Access Language (DAL from Network Innovations), DB Library (Sybase), and SQL-Net (Oracle). Claris Query Tool will be shipped in 1991 but will not be able to access Teradata database machines. For more information about Claris Query Tool, contact Claris.

Red Brick Systems retains the right to market and support EQT for the Teradata Systems. For more information, contact Red Brick.

Claris Query Tool uses DAL as one of its mechanism to access databases. You have to use the EQT version from Red Brick Systems to access the Teradata databases. Red Brick uses Teradata's access mechanism.

EQT is a Query Tool to access databases. To our knowledge, you cannot use WingZ to access the Teradata database directly, because Teradata does not support the DAL access. You can, however, access the database using Red Brick's EQT and import the data (cut and paste) into the spreadsheet.

As of release 1.3 DAL supported access to Teradata's DBC/1012 DBMS but only under an MVS operating system.

## Worldwide Network: Missing Servers Problem (8/93)

Revised: 8/26/93  
Security: Everyone

Worldwide Network: Missing Servers Problem (8/93)

Article Created: 26 February 1991  
Article Reviewed/Updated: 25 August 1993

TOPIC -----

I have questions regarding the performance of a worldwide Liaison network. Servers are dropping off the network, and it seems to be a result of the network configuration.

I need to know what happens when I do a read of a file on an AppleShare server in a remote location over a slow link. In brief, I have a program in Toronto, London, Madrid, Zurich, Frankfurt, and Paris that reads a file from an AppleShare server in New York.

Sometimes the link (Liaison over an asynchronous line into the Tymnet packet Switched network) "breaks" and other times, we seem to "lose" the server. When we try to reconnect to the server, the branch locations sometimes do not "see" the server in the Chooser window for a long enough period to select the server physically. We cannot, therefore, restart the application. Their observation has been 15 seconds of availability. This does not always happen, but it happens too often to not lodge a complaint.

The application checks on and reports all sorts of errors on a read, and it does know when it cannot open a file, because a server is unavailable. I am doing PBHOpenDeny opens and PBRead calls. We have asked the Tymnet network people to look into this, and they have asked the following questions:

- 1) When you open the Chooser window and select a zone, how do the lists of servers appear?

How long does it take to get the list up?

Why do some servers come into and disappear from the list?

Why do some servers never appear in the Chooser window? Is this because

the servers' response time is very slow, and, therefore, the response is ignored until the next request is broadcast? If so, how long is this window? (What is the maximum round-trip delay from the branch Macintosh to the AppleShare server and back?)

- 2) On a read, when a read request is sent to the remote AppleShare file server (from branch to New York) what is the timeout period before the packet is determined to be lost, and is thus retransmitted?
- 3) On a normal AppleShare read, if a data packet times out, how many retries are made before AppleShare decides that the link to the server is dead? Or, how long does AppleShare continue trying before it gives up?
- 4) If I do a read, should I always get back a response, or is it possible that if the Macintosh has lost the file server, AppleShare will be unable to respond, and that the reading application will appear to hang? This seems to happen sometimes, from what the branch people say. Sometimes, if we lose the link to New York, the whole Macintosh hangs and must be restarted.

#### DISCUSSION -----

What version of Liaison are you using? Versions before 3.0 are no longer supported. Farallon purchased the product from InfoSphere and is offering support only for version 3.0 and later (3.0.5 is compatible with System 7.1), which fixed several bugs and added support for AppleTalk phase 2.

One problem in versions before 3.0 was the inability of Liaison to display zone lists when the zone list transverses more than one ZIP packet (around 40 zones depending on the size of the name). We would also suggest a call to Farallon to discuss the current problems the account is experiencing with the product. We cannot control how third-parties choose to implement routers and other such products based around AppleTalk. This can cause problems if the product was implemented in a way that the protocols were never designed to accommodate.

Because the AppleTalk protocols were never designed to work over slow asynchronous links or over wide-area networks, there are several issues that need to be addressed before AppleTalk can become a valid protocol for use in these types of environments.

Here are direct answers to your questions:

- 1) This is how it really works in a nutshell:

The Chooser sends out a Name Binding Protocol (NBP) packet looking for all devices of type XXXXXX, for example, type LaserWriter. It sets up a buffer of 512 bytes for the responses. The responses look like:

|                    |                |                        |
|--------------------|----------------|------------------------|
| device name length | 1 byte         |                        |
| device name        | variable bytes | e.g. MyLaser-Hands off |
| type name length   | 1 byte         |                        |

|                   |                |                  |
|-------------------|----------------|------------------|
| type name         | variable bytes | e.g. LaserWriter |
| zone field length | 1 byte         |                  |
| zone name field   | variable bytes | probably *       |

The Chooser gets a packet back for each device, i.e., each LaserWriter. When the 512-byte buffer is full of these packets, it stops looking for device names to display. This means that some LaserWriters might not be displayed immediately. If you leave the Chooser window open, however, the Chooser will continue to send out NBP lookups every 1.47 seconds. Different LaserWriters could respond more quickly each time. In this case, you may see the Chooser show and hide various devices.

You can see from this that the number of devices Chooser can show depends on how long the type name is (like "LaserWriter") and how long the device names are. The number 18 is an average number, based on the device type being about 13 or 14 characters long and the device name being about 10 or 11 characters long. In System 7.0, the buffer size the Chooser will use will be increased to 1024. This means, on average, the Chooser can display about 36 devices.

- 2) This depends on the direction of the transfer. Workstation to Server copy takes 6 seconds and server to Workstation copy about 2 seconds.
- 3) Retries are set to infinite. The session timer for the connection is set to 2 minutes. This is really what dictates how long the reads are attempted before the transaction is aborted. The session timer is restarted each time a tickle packet is received by either the workstation or the server. Tickle packets are sent out every 60 seconds by both the server and the workstation to allow a way of detecting if the other end of the connection has gone down.
- 4) No, you aren't guaranteed a response, but the session timer should expire after 2 minutes and pop up a dialog telling you that the server has unexpectedly quit.

## LaserWriter Driver 6.0.2: Resource for Printing Envelopes

Revised: 2/26/91  
Security: Everyone

LaserWriter Driver 6.0.2: Resource for Printing Envelopes

=====

This article last reviewed: 10 January 1991

TOPIC -----

What are the advantages of LaserWriter driver 6.0.2 over LaserWriter driver 6.0.1?

DISCUSSION -----

LaserWriter driver 6.0.2 is included with System Software 6.0.7, in the Apple Color folder on the Printing Tools disk. The only difference between LaserWriter driver 6.0.1 and LaserWriter driver 6.0.2 is that LaserWriter driver 6.0.2 has an added resource for printing envelopes.

In Page Setup, you now have the options of either printing envelopes from the edge or from the center. This was done for the Personal LaserWriter.

Manual feed on a LaserWriter II has two paper guides which move in and out together, allowing you to print from the center. Manual feed on the Personal LaserWriter has only one paper guide, which moves from the edge out. You would, therefore, want to put the envelope all the way over to the edge. LaserWriter driver 6.0.2 gives you the option to do this.

## AppleShare PC: No Support For Digital's DEC Network Card LC

Revised: 2/26/91  
Security: Everyone

AppleShare PC: No Support For Digital's DEC Network Card LC

=====

This article last reviewed: 10 January 1991

TOPIC -----

Does Apple support Digital's DEC Etherworks LC card for the PC with AppleShare PC 2.0?

DISCUSSION -----

AppleShare PC can work with any network card that has an ODI (Open Data-Link Interface) compliant MLID. However, the only MLIDs we know of are those supplied with AppleShare PC. We haven't heard of anyone writing one for a DEC Ethernet card, although it could be done.

If you know of someone interested in developing an MLID for a specific card, information is available from APDA in the form of the Open Data-Link Interface Developer's Guide, part number M0355LL/A. This document details the specification, and provides example source code for a working driver. For more details, search the Technical Info library under "APDA."

## How to Remove AppleShare PC Code from PC Memory

Revised: 2/26/91  
Security: Everyone

How to Remove AppleShare PC Code from PC Memory

=====

This article last reviewed: 10 January 1991

TOPIC -----

I am running AppleShare PC (2.01). Currently, WordPerfect runs on the PC (with 512K RAM) until I start AppleShare using ABOTH. After checking E-mail, which is the main reason I use AppleShare PC, I type AOFF to kill AppleShare, but WordPerfect no longer has enough room to fully execute. Only a warm reboot with Control-Alt-Del frees up the memory. Is there any way (short of rebooting) I can free ALL memory after typing AOFF?

DISCUSSION -----

There is a way to remove all AppleShare PC code without rebooting. It requires the use of mark/release utilities. This kind of program is used to mark a position in memory so that TSR programs and drivers loaded later, like AppleShare PC, can be removed with the companion release program.

## Macintosh: Viewing CCITT Group IV Images

Revised: 6/1/92  
Security: Everyone

Macintosh: Viewing CCITT Group IV Images

=====  
Article Created: 26 February 1991  
Article Last Reviewed: 22 May 1992  
Article Last Updated:

TOPIC -----

I understand that one or more vendors have products that let CCITT Group IV images be decompressed and viewed (pan, zoom, scan, and so on) on the Macintosh. What are the supporting products and companies?

The images we have are large 2-bit images of engineering drawings. They conform to the DOD CALS raster Specification, which is essentially 200 DPI CCITT G4.

DISCUSSION -----

We found the following information concerning Creative Solutions' Compression, Expression and Rotation Board.

"A NuBus board that provides compression, expansion and rotation on image data.

"The Compression/Expansion/Rotation board performs all of the above functions on image data. The board features: compression or expansion throughput in excess of 16 million pixel elements per second; ROM with standard half duplex Macintosh device drivers that are installed automatically at startup; CCITT input driver reads data to a supplied buffer and returns the actual count read; conversion modes set via control calls to either input or output drivers; and accelerated hardware rotation of 32 by 32 pixel tiles."

For more vendor information, search under "Creative Solutions."

## Macintosh IIsi and NuBus Card Power Draw

Revised: 7/16/92  
Security: Everyone

Macintosh IIsi and NuBus Card Power Draw

=====  
Article Created: 11 January 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated:

TOPIC -----

Apple data sheets state that the Macintosh IIsi NuBus cards should not draw more than 13.3 watts of power. I'm interested in putting some Macintosh IIsi computers into a Token Ring environment where the TokenTalk NB Card draws 15 watts. Has this combination been tested, and if so what was the result?

DISCUSSION -----

Because of the low-power design of many Macintosh IIsi components, the computer should be able to handle cards requiring up to 20 watts. Although this exceeds the normal, single-slot, NuBus specification, there is adequate power available in Apple supplied configurations. However, if you use third-party internal hard drives or other components that draw additional power, the power available to the NuBus card may be lower.

All Macintosh IIsi configurations we ship can handle the 15-Watt requirement of a TokenTalk NB Card. It has been tested, and is fully supported with the Macintosh IIsi.

## LaserWriter ROMs: PostScript Versions Explained

Revised: 5/20/91  
Security: Everyone

LaserWriter ROMs: PostScript Versions Explained

Article Created: 11 January 1991  
Article Last Reviewed: 26 April 1991  
Article Last Updated: 26 April 1991

TOPIC -----

I have some technical questions about different versions of PostScript:

- 1) I thought that LaserWriter ROM versions 1.0, 2.0, and 3.0 correspond to versions 23, 38, and 47 of PostScript. However, in LaserWriter Plus printers the ROM contains 42.2. What happened to 47.0?
- 2) Also, when extracting information from a printer, CE Software's Widgets reports version 47.0 (1) for a LaserWriter IINT and a LaserWriter IINT which was upgraded to a LaserWriter IINTX. It also reports 51.8 (3) for a LaserWriter IINTX. What do the numbers in parentheses really stand for?
- 3) What is the difference between 47.0 and 51.8?

Adobe Technical Support said that these versions are functionally identical, which doesn't really answer my question.

DISCUSSION -----

- 1) There is a an error in the LaserWriter Plus ROMs that gives the version number 42.2 if read from PostScript, even though the ROMs contain Version 47 of PostScript.

PostScript version 47 is different than PostScript version 38 in the following ways:

- It is slightly faster.
- It contained miscellaneous bug fixes.

- It added code to support SCSI hard disks (as in the LaserWriter IINTX).

The Rev 47, PostScript-code-equipped LaserWriters can function up to 25 percent faster when printing text or up to 40 percent faster printing bit-mapped graphics. PostScript version 38 is functionally equivalent to PostScript version 47 except for the above details.

2) CE Software's Widgets 3.0.4 issues two PostScript commands to get the "51.8(3)" from the LaserWriter IINTX with the latest ROMs. The first is the "version" command. This command returns a string that identifies the version of the PostScript language and interpreter being used. The second is the "revision" command. This command returns an integer designating the current revision level of the machine-dependent portion of the PostScript interpreter.

3) PostScript version 51.8 allows for the following enhancements:

- The entire font list is no longer searched when looking for a font. The search stops as soon as the font is found. This can save a lot of time if there is a hard disk attached and the font is a ROM font.
- Full support of software switching between emulations and ports. It is now possible to both switch into and out of an emulation mode via software.
- Improved support of multiple SCSI disks. You can now connect up to 8 SCSI hard disk drives to the LaserWriter IINTX SCSI port. Up to 80 percent of the hard disk with the lowest SCSI ID is used for font caching with the remainder of that disk and all of any other connected hard disks used for downloaded fonts. Each hard disk is now formatted as a separate volume, which lets a user move a disk (other than the startup disk) between systems without needing to reformat.
- Additional characters in the HP Laser Jet+ emulation. Four characters have been added that had been left out of the original implementation of HP Laser Jet+ emulation.
- Improved default settings for HP Laser Jet+ bit map printing. Previously, bitmaps in HP Laser Jet+ mode were interpreted at 7-bit, thus ignoring a significant bit. The new ROMs default to 8-bit serial communications.

Note: These new ROMs are in all LaserWriter IINTX printers with a part number ending in 6004/A.

## HyperCard 2.0: LaserWriter Driver 5.2 Print Problem (11/94)

Revised: 11/7/94  
Security: Everyone

HyperCard 2.0: LaserWriter Driver 5.2 Print Problem (11/94)

=====

Article Created: 01 March 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I have been trying to resolve a HyperCard 2.0 printing problem. My system includes System 6.0.5, Finder 6.1.5, LaserWriter Version 5.2, AppleTalk driver version 53, and no INITs.

I'm unable to print cards from a stack that I have developed. When I try to "Print Card" from the File menu, I get a message "Processing Job" that stays on the screen indefinitely. The printer still thinks it is connected to this job, even after I cancel printing, so I have to restart the printer.

Oddly enough, this stack does print to a QMS PS2200 Laser Printer.

DISCUSSION -----

We were able to reproduce the problem with the stack you sent. However, using LaserWriter driver version 6.x the card printed fine. Try upgrading to newer drivers; that may well solve the problem.

## DeskWriter Printer & Macintosh: Service Notice from Apple, H-P

Revised: 5/23/95  
Security: Everyone

DeskWriter Printer & Macintosh: Service Notice from Apple, H-P

Article Created: 1 March 1991  
Article Reviewed/Updated: 23 May 1995

TOPIC -----

This article contains an Apple Service Notice and its Hewlett-Packard counterpart sent out to Hewlett-Packard service providers on November 1, 1990.

DISCUSSION -----

APPLE SERVICE NOTICE

Some Macintosh Serial Ports Affect Hewlett-Packard DeskWriter Printer Operation

Overview

=====

It has come to Apple's attention that some customers have been experiencing print problems when using a Hewlett-Packard DeskWriter printer and a Macintosh computer. Typically, the customer has purchased the computer and the printer at the same time. The customer connects the DeskWriter to the Macintosh printer port and configures the printer for serial mode. Usually the system works properly for several weeks or even several months; suddenly the printer will not print the selected text. When the DeskWriter will not print the selected text, the printer lights will flash, and the printer sometimes prints "Error Trap 10864".

If the cable is moved from the Macintosh printer port to the modem port, the DeskWriter prints properly; however, it may fail in a similar manner after a few weeks of use.

It is important to note that the Macintosh printer port may still be operational and may pass a diagnostic test or work normally with other print devices.

Customers have reported this when using a Macintosh II, Macintosh IIfx, Macintosh IICx, Macintosh IIcx, Macintosh IIfx, or Macintosh SE computer. The problem appears to be limited to a small number of these systems.

## Solution

=====

Both Apple and Hewlett-Packard have conducted separate investigations and have isolated the cause to a component failure on the Macintosh logic board. When this failure occurs the sensing circuit in the DeskWriter causes the printer to switch to AppleTalk mode, thereby prohibiting further communication with the computer in serial mode.

To correct the problem Service Providers should replace the logic board on the Macintosh system. Systems within the warranty or AppleCare period should be repaired under these programs. For systems outside the warranty or AppleCare period contact Technical Operations for further instructions.

## HEWLETT-PACKARD ANNOUNCEMENT

-----

### Some Macintosh Serial Ports Affect DeskWriter Printer Operation

For the past few months, Hewlett-Packard has been receiving a small number of customer reports that DeskWriter printers won't print on Macintosh computers. Typically, the customer has purchased both computer and printer at the same time. The customer connects the DeskWriter to the Macintoshes Printer port and configures it for serial mode. The system works properly for a few weeks or even a few months; then the printer does not print the selected text. The DeskWriter's lights flash, and the printer sometimes prints "Error Trap 10864." If the cable is moved to the Macintoshes Modem port, the DeskWriter works properly; however, it may fail in a similar manner after a few weeks have passed. This has occurred on Macintosh II, Macintosh IIci, Macintosh IICx, Macintosh IIfx, and Macintosh SE computers.

Both Apple and Hewlett-Packard have conducted separate investigations and have isolated the cause to a component failure on the Macintosh logic board. We have determined that on a small number of Macintosh computers the resistances of the I/O lines degrade over time and eventually fall below the RS-422 specification. When this occurs, the sensing circuit in the DeskWriter causes the printer to switch to AppleTalk mode, thereby prohibiting further communication with the computer in serial mode.

It is important to note that the Macintoshes Printer Port may still be operational and may pass a diagnostic test or work normally with some other print devices. Hewlett-Packard's and Apple's joint recommendation is that any DeskWriter user who experiences this problem should return the Macintosh to an Apple- authorized service provider for repair, according to Apple's recommended procedures.

Apple will soon be issuing a statement (Apple's Statement is above) that further describes this problem, along with their technical recommendations. Until that time, service providers should contact their Apple Service Representative for instructions. In closing, Hewlett-Packard would like to thank Apple for their cooperation and prompt response in this matter and express our regret for the inconvenience this has caused our mutual customers.

IMPORTANT NOTES (5/95)

=====

This problem is limited to the Macintosh models listed above. If you have another model other than the one's listed above, your problem is not necessarily a hardware failure. In most cases, when you get an error message generated by the DeskWriter software mentioning that the serial port is in use, it is caused by using the serial DeskWriter printer driver, and having AppleTalk turned on.

In order to print using the serial DeskWriter printer driver, you must have AppleTalk turned off. If you need to use AppleTalk, use the AppleTalk DeskWriter printer driver.

## AppleShare PC and Memory Allocation

Revised: 3/1/91  
Security: Everyone

AppleShare PC and Memory Allocation

=====

This article last reviewed: 21 January 1991

TOPIC -----

I am using AppleShare PC and when I "convert printer" (F2), the memory is not being allocated. I'm running a PS/2 with DOS 3.3 and a Digital DayStar LT200 LocalTalk card.

DISCUSSION -----

It sounds like you need to increase the AppleShare PC memory pool. At boot time, AppleShare PC sets aside an amount of memory for protocol stacks and connections to file and print servers. Each printer connection consumes 7K, so it is easy to exceed the default memory-pool size if you make more than one connection.

The amount of memory that AppleShare PC allocates is defined in the NET.CFG file, generally located in the directory with the other AppleShare PC files. The important line will be near the top of the file and should look something like this:

```
MEMPOOL 23K
```

Use EDLIN, or (preferably) a text editor you like, to increase the number. First, try making it 7K larger than its current setting. Save the changed file and reboot. The extra memory allocated should let you make the printer connection. Note that this additional memory will be taken from your available conventional memory, so it should not be larger than needed.

You may want to make sure you're not making unnecessary connections to printers that aren't being used. A leftover automatic connection may be using up your default memory pool when you don't need it. If possible, use the DA to "Review Auto-Connections" and remove those you don't use.

AppleShare PC and Zone Limits

=====

This article last reviewed: 21 January 1991

TOPIC -----

Does AppleShare PC have a 100-zone limit?

DISCUSSION -----

AppleShare PC's only limit with respect to the number of zones it can work with involves the memory available in its memory pool when DA is run. This only affects making network connections using DA, and has no effect once those connections are made. Even then, the connections could still be made using manual ANET commands, even with thousands of zones. We use default installations of AppleShare PC here at Apple, where there are over 140 zones, and have no trouble using DA to make connections.

Problems can occur if the AppleShare PC memory pool is almost full. This is the memory that AppleShare PC allocates at startup and is configurable by changing the MEMPOOL setting in the NET.CFG file. If you are experiencing the "Not Enough Memory" message, increase this number by 1 or 2K and the problem should be eliminated. Because the NET.CFG file is read when AppleShare PC loads, the user must edit the file and then reboot the PC before the change can take effect.

Current versions of AppleShare PC actually require Phase 2 networks. This is frequently a problem when people upgrade from an old version (pre 2.0) and haven't upgraded all their services to be Phase-2-compliant. The AppleShare PC node cannot see Phase 1 services like AppleShare File servers running EtherTalk 1.x.

## MacX25: Problem Reports and Enhancement Request

Revised: 3/1/91  
Security: Everyone

MacX25: Problem Reports and Enhancement Request

=====

This article last reviewed: 11 January 1991

TOPIC -----

We've noted the following problems with MacX25:

- 1) To use MacPAD, MacTerminal needs more than 512K of RAM free.
- 2) If you have a session open, and have disabled the PAD command mode, typing a Control-P seems to indicate that your session is closed, yet the MacPAD status still shows you as connected. Nothing could be found that would let the session be re-used again without doing an Open Connection.
- 3) MacX25 apparently cannot insert a calling address. At least, we can't find any option for this setting. We had to patch our network to make this work, as we validate the calling nua before the call is directed to its destination. We need the ability to trace a call for accounting purposes and for troubleshooting problems.

Its implementation should be based on the user ID and assigning each user an nua or sub-address (i.e., unique address). The sub-address would be easier to maintain, because the administrator would have to type only two digits instead of the whole nua. When using the sub-address scheme, the server would be assigned an nua like 10498001%%, where %% is replaced by the sub-address from the user ID.

- 4) MacTerminal seems to hang quite frequently, at least on a Macintosh IIci, when trying to change the PAD command mode while a connection is open (actually a "stuck" connection as described in question 2).
- 5) The installation of MacTerminal puts an INIT in the System file that seems incompatible with other INITs, namely with INITPicker (when using override). This INIT should be a separate file from the System file, so the user can control when and if the INIT should run.

DISCUSSION -----

- 1) The minimum suggested memory size for MacPAD (MacTerminal or CommToolBox) is 1MB, though 2MB is recommended. The MultiFinder "Suggested Memory Size" is 560K for MacTerminal itself.
- 2) Questions 2 and 4 are related:

The "MacX25 User's Manual" (page 110) suggests you can go into the PAD command mode by entering Control-P. That means if you checked "enabled PAD command mode" (see "Connection Settings" on page 97), you can escape from data transfer (page 99), then enter any of your CCITT PAD commands from the keyboard. When you have checked "enabled MacPAD command mode", you can "escape" into MacPAD command mode by entering Control-P or by choosing Command Mode from the MacPAD menu.

However, if you have NOT checked "enable MacPAD command mode", you cannot enter a PAD command mode with the Escape key sequence or menu to escape to data transfer mode after starting a session. The host will interpret anything you enter through the keyboard as data. If you try to escape to command mode with a Control-P (Command Mode in the MacPAD menu is not available), the system may appear to hang. If you check Status in the MacPAD menu, it will show that you still have a live session. If you are patient, some hosts will time out (the ones we tested did so after 1 minute) and resume the data transfer.

During this time, the session menu gives you the option to open a connection, but doing so will hang your system. If your host never times you out, we recommend you quit MacTerminal, reboot, and restart your session.

- 3) We passed this enhancement request along. Thanks.
- 4) See the second item above.
- 5) We haven't had any conflicts with INITPicker 2.0 (or other INITs) and the INIT that the Communications Toolbox installs into the System file. We have used this combination on various systems including a Macintosh Portable, Macintosh IIci, Macintosh IICx, and Macintosh IIX, running various versions of System Software including 6.0.4, 6.0.5, and 6.0.7. It is true, however, that INITPicker 2.0 cannot control the state of the INIT when it is installed in the System Folder. However, it is one less variable a user must monitor to conduct a successful communication session.

## A/UX: YP and MacTCP Tool Problem (9/94)

Revised: 9/2/94  
Security: Everyone

A/UX: YP and MacTCP Tool Problem (9/94)

Article Created: 11 January 1991  
Article Reviewed/Updated: 2 September 1994

TOPIC -----

I am using A/UX with Yellow Pages in an all-Sun environment to maintain my home directory on a remote Sun server. When I launch MacX, I get the message that "Connection Tool Cannot be Found". Thinking that the connection tool needs to be in the Extensions Folder within the Macintosh System Folder on the Home directory (on the remote Sun server), I ran "Systemfolder" from the command line. Upon logging off and back on, I was unable to complete the YPbind process.

I conclude that Macintosh System Folders are illegal on a Sun file system, or that YPbind cannot reconcile the Macintosh system resources with the home directory. In any case, I cannot think of any way to have MacX use the communications tool (MacTCP) from Root, or from any other local users.

DISCUSSION -----

When executing a "systemfolder" command to create a personal System Folder under the user's home directory, it creates a "System Folder" under the user's home directory, copies files from /mac/lib/SystemFiles directory but not from the default /mac/sys/'System Folder' directory. The communication tools, which were stored in the /mac/sys/'System Folder'/Extensions directory, are not copied to the user's newly-created Extensions folder.

For users with their home directory on the remote YP and/or NFS server to launch MacX successfully, the MacTCP Tool must be manually copied into their own Communication Folder under the user's \$home/'System Folder' directory. Otherwise, MacX complains with the following message:

An unexpected error has occurred: The Macintosh Communication Toolbox could not be initialized because there are no communication tools installed.

We have tested launching MacX in one A/UX without any problem from an account whose home directory resides (via nfs mount) in another A/UX YP and NFS server. We do not think there is a problem between Macintosh System Folders and Sun YP and NFS file system.

Regarding being unable to complete the YPbind process, was there any message indicating that you were unable to complete the YPbind process? Was the YPserv (YP server) running before YPbind (YP client) was started? We do not think that your problem (launching MacX) has anything to do with the YPbind or YPserver, unless the YP server and client were not up and running.

Try to copy the MacTCP Tool manually into the user's System Folder/Extensions folder, logout and login, then launch MacX again.

## HyperCard 2.0: Using HyperDialer (8/95)

Revised: 8/24/95  
Security: Everyone

HyperCard 2.0: Using HyperDialer (8/95)

Article Created: 1 March 1991  
Article Reviewed/Updated: 24 August 1995

TOPIC -----

I have a stack that was designed to use the HyperDialer as part of our office mail system. I recently began using HyperCard 2.0 and found that when HyperCard dials the tones to the speaker, they are either too fast or corrupted. This causes the dialing procedure to fail.

Is there a reason for this? If so, are there provisions in HyperCard 2.0 for greater control over dialing through the speaker?

DISCUSSION -----

DataDesk International, manufacturer of HyperDialer, was unaware of any inconsistencies between HyperCard 2.0 and their product. They did say that if the numbers are dialed too quickly, the phone system will interpret them as trash and not dial appropriately.

While there are no new controls for HyperCard's "dial" command, we found that dialing each number in a separate command caused approximately a 10 percent delay in the dialed string.

Begin\_Table

| Fast | 10% Slower |
|------|------------|
|------|------------|

|                   |            |
|-------------------|------------|
| on mouseUp        | on mouseUp |
| dial "1234567890" | dial "1"   |
| end mouseUp       | dial "2"   |
|                   | dial "3"   |
|                   | dial "4"   |
|                   | dial "5"   |
|                   | dial "6"   |
|                   | dial "7"   |

```
dial "8"  
dial "9"  
dial "0"  
end mouseUp
```

End\_Table

You can further slow the dialed string by placing commas or semicolons between the numbers. A comma causes a one-second pause; a semicolon results in a ten-second pause.

```
on mouseUp  
dial "1,2,3,4,5,6,7,8,9,0"  
end mouseUp
```

For more information on HyperDialer, contact DataDesk International. For more details, search the Technical Info library under "DataDesk."

## Personal LaserWriter: Printing Envelopes

Revised: 2/12/93  
Security: Everyone

Personal LaserWriter: Printing Envelopes

=====

Article Created: 1 March 1991

### Article Change History

-----

02/12/93 - REVIEWED

- Vendor information.

### TOPIC -----

I'm trying to print envelopes with a Personal LaserWriter, but can't get a clean feed when using envelopes.

### DISCUSSION -----

The Personal LaserWriter models have a somewhat more complex paper path than that of the LaserWriter II models. We have heard reports of problems with some envelopes, especially those made from a heavy stock.

Handling can be improved by using envelopes that are approved for use in laser printers and copiers, and by feeding to the face-up delivery tray. The recommended envelopes are No. 10 (standard business envelopes) or those specially made to withstand use in laser printers and copiers. Two manufacturers of such envelopes are James River Corporation (Groveton Division) and Avery. Check with your local office supply dealer or with the manufacturer.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## LaserWriter IINTX: RAM Allocation

Revised: 3/1/91  
Security: Everyone

LaserWriter IINTX: RAM Allocation

=====

This article last reviewed: 21 January 1991

TOPIC -----

How much RAM is needed to get a second page buffer with legal-size paper on LaserWriter IINTX?

DISCUSSION -----

Additional RAM does not provide space for a "second page buffer" in the LaserWriter IINTX. We found the following information on page 122 of the "LaserWriter IINT/NTX Owner's Guide" (ROM revision 3.0 version):

### Memory Upgrades

You can install up to 12MB of RAM in the LaserWriter IINTX. You can also add a font expansion card. These memory upgrades are not possible on the LaserWriter IINT.

RAM upgrades for the LaserWriter IINTX provide the following benefits:

- the ability to print very complex documents (graphics and CAD documents, for example) that might not print on printers with less memory
- faster performance on complex documents
- faster performance when using downloaded fonts
- faster performance when printing documents that have been scaled down from larger originals (organization charts, maps, flow charts, for example)
- The ability to increase the imageable area of a document (you can use more of a sheet of legal paper, for example)

Adding more RAM provides these benefits in three ways:

- More RAM allows more fonts to be downloaded (sent over the network) to the printer at any one time. The printer is less likely to need to retrieve large font files over busy network cables, saving you time and improving the performance of the entire network.
- More RAM increases the space available for font caching. Before the LaserWriter IINTX can print, it converts the PostScript outline fonts into bitmaps, which it stores (caches) in RAM. When the demand for RAM exceeds the supply, the printer discards the less recently used bitmaps in favor of the newer ones. When the discarded bitmaps are needed again, the printer must rebuild them. With additional RAM, the printer will need to rebuild bitmaps less often.
- Finally, more RAM gives your printer more space to store the calculations it uses to compute large or complex page layouts. This is why you can print more complex documents and use a larger imageable area when you install more RAM.

## A/UX: Installing/Deinstalling AppleTalk (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: Installing/Deinstalling AppleTalk (9/94)

Article Created: 1 March 1991  
Article Last Reviewed: 8 September 1994

TOPIC -----

I have a problem with AppleTalk on A/UX:

- 1) AppleTalk is installed, and if I choose a LaserWriter in the Chooser, all is okay.
- 2) If I de-install AppleTalk with "newconfig appletalk" and then reboot, at the login dialog box, a message appears several times indicating that the system cannot find the LaserWriter I recently chose.

Is there anything else needed to de-install AppleTalk?

DISCUSSION -----

The following are notes for installing and/or de-installing AppleTalk on A/UX:

- The "appletalk" module is configured with the standard A/UX kernel. You don't have to actually do "newconfig appletalk" in the first place. However, if you suspect that some modules of AppleTalk might be corrupted for some reason, you may de-install AppleTalk by doing "newconfig noappletalk", then re-install it by doing "newconfig appletalk".
- You may choose either EtherTalk or LocalTalk for printing on an AppleTalk network. This is controlled by the /etc/appletalkrc file with a line indicating which interface is used. For instance, to use LocalTalk, the following line needs to be specified:  
  
interface = localtalk0
- The default LocalTalk printing port is the printer port (/dev/tty1). This port must be set to getty "off" in the /etc/inittab file.

- The following commands should be initiated whenever the interface is changed:

```
appletalk -d          # bring AppleTalk down
modify the /etc/appletalkrc  # choose AppleTalk interface
appletalk -u          # bring AppleTalk up
```

- The "appletalk -s" command is useful to see if the AppleTalk interface is active, and to display LAP and DDP statistics.
- You may use "Chooser" from the Apple menu or use the "at\_cho\_prn" command from A/UX CommandShell window to choose your favorite printer.
- Two printer spoolers, Berkeley printer spooler (lpd) and AT&T System V printer spooler (lp), are available under A/UX. The default is "lpd".

For more information, refer to Chapter 3 "Connecting to an AppleTalk Network" in the A/UX Network System Administration documentation.

For the error messages appearing on the Login Dialog, you might check if both LaserWriter and Laser Prep are installed in A/UX or the Personal System Folder, and if it is compatible with the one currently used by that LaserWriter.

## MacX and Extended Keyboard Mapping (5/95)

Revised: 5/1/95  
Security: Everyone

MacX and Extended Keyboard Mapping (5/95)

Article Created: 21 January 1991  
Article Reviewed/Updated: 1 May 1995

TOPIC -----

Can you give me some information about MacX and extended keyboard mapping?

DISCUSSION -----

Unfortunately, there is no information on extended keyboard mapping in the "MacX User's Guide." However, according to MacX engineering, the PATHWORKS "MacX User's Guide" shows such a map in Chapter 1, Section "Mouse and Keyboard Differences". For example, the "Page Up" key is used to scroll to the beginning of a text field or to the top of a list.

Also, the user can use "xev", an X11 client to print contents of X events, to determine the keyboard mapping. "xev" is normally found in X11 client distribution. It is available in A/UX X11 Window System. The "xev" program creates a window and then asks the X server to send "events" whenever anything happens to the window. Events may include move, resize window, mouse clicked in, and keyboard typed in, and so forth. These reports can be displayed from the "Command Output" menu of the "Remote" menu in MacX.

## A/UX: AppleTalk Phase 2 and Ethernet Card Compatibility (8/94)

Revised: 8/26/94  
Security: Everyone

A/UX: AppleTalk Phase 2 and Ethernet Card Compatibility (8/94)

=====

Article Created: 21 January 1991  
Article Reviewed/Updated: 26 August 1994

TOPIC -----

My group is having problems with third-party NuBus Ethernet cards and Phase 2 networks running on Macintosh II-class machines with A/UX 2.0. Is there a compatibility list of which cards support Phase 2 AppleTalk protocol? Is Apple's card fully compatible with EtherTalk 2.0 drivers using A/UX 2.0?

DISCUSSION -----

We don't have a compatibility list of third-party Ethernet cards which support or don't support the AppleTalk Phase 2 protocols. Apple has left it to the developers to decide whether to write and implement a Phase 2 complaint driver for their cards. There is no conformity testing for third-party cards. This makes it difficult to compile a list of cards with known compatibility problems.

We would suggest working closely with the manufacturer to ensure that any bugs in their drivers can be discovered and repaired.

The Apple Ethernet NB card is fully compatible with Phase 2 protocols when running under all versions of A/UX.

## A/UX 2.0: Unsupported Status csCode 8 (3/93)

Revised: 3/3/93  
Security: Everyone

A/UX 2.0: Unsupported Status csCode 8 (3/93)

Article Created: 1 March 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
    • For technical accuracy  
03/02/93 - REVISED  
    • Added note about After Dark compatibility with A/UX 3.0.

### TOPIC -----

I am getting the message "unsupported status csCode 8" under the A/UX 2.0 32-bit Finder. Do you have any suggestions?

Here's a copy of the console log:

```
Running on mc68020
mc68881 Floating Point Coprocessor ID 1
Onboard SCC serial driver.
fd:floppy driver ver 1.9; IWM chip, d0 is 800K (2 head)
mc68020 caching enabled
tc:Apple 40SC tape driver ver 1.4
Motherboard LocalTalk
total memory size: 8388608 bytes
available memory: 6033408 bytes
I/O Acceleration: version g21, maxba=7, maxwb=7
unsupported status csCode: 8
```

.  
.  
.

Scroll up in this window to see old console messages.

### DISCUSSION -----

It's been reported that the "unsupported status csCode: 8" error message is caused by applications that try to write a "SCRN 0" resource to the System file.

Further research reveals that the csCode: 8 is not included in the current supported control status code list (video.h) of the A/UX toolbox video driver. The following status codes are supported under A/UX 2.0:

```
#define cscGetMode 2
#define cscGetEntries 3
#define cscGetPages 4
#define cscGetBaseAddr 5
#define cscGetGray 6
#define cscGetVideoDefault 9
```

If any Macintosh application, like "After Dark 2.0", tries to use some video features not supported in the above list, it might have this problem too.

Note: After Dark is compatible with A/UX 3.0 because A/UX 3.0 supports the needed video calls.

## AppleTalk Traffic When Launching Local Application

Revised: 3/1/91  
Security: Everyone

AppleTalk Traffic When Launching Local Application

=====

This article last reviewed: 21 January 1991

TOPIC -----

I have a problem for which I have no explanation. If I have one or more file server volumes mounted (but none of the directory windows are open), and I try to launch a local file with a local application, there is a delay of several seconds during which the AppleTalk traffic indicators blink.

This delay does not always occur and its occurrence does not appear to be tied to any specific condition on the Macintosh. I don't understand why there should be any AppleTalk traffic when launching a local application.

DISCUSSION -----

Any time an application is launched, all of the information about any changes that have taken place on any currently-mounted volumes needs to be written out. This is done by flushing each of the mounted volumes. This operation normally happens very quickly. However, updating volumes over a network can sometimes take time if the network is busy. This is not something that AppleTalk or AppleShare takes care of, but a job that the Finder does.

## MacTCP: BOOTP/RARP Server Priority

Revised: 3/1/91  
Security: Everyone

MacTCP: BOOTP/RARP Server Priority

=====

This article last reviewed: 21 January 1991

TOPIC -----

Can I change the order that MacTCP looks for server addresses? My problem is that MacTCP uses RARP first (which then times out after 8 seconds) before then using the BOOTP protocol. Is there a way I can rearrange the order so that BOOTP comes up first before having an 8-second delay?

DISCUSSION -----

According to MacTCP Engineering, MacTCP remembers what protocol was successful in acquiring its IP address over startups, so that the successful protocol is tried first. In other words, once MacTCP has located and acquired an IP address from a BOOTP server it then uses the BOOTP server before trying the RARP server the next time MacTCP is used. The first time MacTCP is used, the RARP server may be tried first. However, this should not continue once the BOOTP server is located.

There is currently no way to configure MacTCP to select server priority via a control-panel device or by using ResEdit.

## A/UX: UFS Subdirectory Limit (9/94)

Revised: 9/2/94  
Security: Everyone

A/UX: UFS Subdirectory Limit (9/94)

=====

Article Created: 21 January 1991  
Article Reviewed/Updated: 2 September 1994

TOPIC -----

I came across an interesting limitation problem of A/UX 2.0: You can create only 1000 subdirectories within a directory. After that, mkdir won't make any more subdirectories. Instead, you get the message:

```
mkdir: another: Too many links
```

We need to create more than 1000 subdirectories inside one directory because the software we are porting to A/UX creates a directory for each department at the University, and there are more than 1000 departments.

DISCUSSION -----

We have verified that there is a limitation on the number of subdirectories created within a directory under A/UX 2.0 UFS file system. The maximum is 1000. This is defined in the /usr/include/sys/param.h file with a line:

```
#define MAXLINK 1000 /* max links */
```

The maximum number of subdirectories under A/UX 3.0 is 32,767.

## A/UX: uucp and Mail Questions (9/94)

Revised: 9/14/94  
Security: Everyone

A/UX: uucp and Mail Questions (9/94)

Article Created: 21 January 1991  
Article Reviewed/Updated: 13 September 1994

TOPIC -----

I am trying to write a script for an L.sys file that will let me connect to a 3B2/1000 machine via ISN using uucp. The beginning of the script looks like this:

```
" ATD555-1212,\015 expect nothing send dial string
2400 \r\r expect 2400 send two carriage returns
```

This is where the confusion starts. The carriage returns must be sent to set the line characteristics (autobaud). When I manually use cu to connect, the two carriage returns typed are not echoed, but a 4- or 5-line banner is sent back.

When I call with the line

```
uucico -r1 -sLAB -x9
```

the chat dialog cranks up and the number is dialed. However, when the modem answers, the 2400 is picked up by the script. The modem then flashes the TX light. I assume this means the carriage returns are being sent. However, the RX light never flashes and uucico hangs and eventually times out.

I don't believe the Welcome header is being sent. I have tried

```
\r,,\r
```

and several variations, i.e., more carriage returns and a variety of commas in various positions. I have a feeling that only one carriage return is being sent. This carriage return does not echo, and the program waits forever, because the header will not be sent.

- 1) Does uucico send characters one at a time and wait for the echo before sending the next one? This would account for the hang, because the first two carriage returns are munched by the autobaud mechanism.
- 2) If the answer to the above is yes, is there any workaround? I tried `\e\r\r` but got the same results.
- 3) Assuming I can finally get the carriage returns processed and cause the header to be sent, do I have to process each line of the header with an "expect-send" pair, or can I simply "expect" the tail of the last line of the header?

I solved the problem of the autobaud not echoing characters. Recall that I have to send several carriage returns to get the attention of the system after I get the connect message from the modem. Instead of sending `\r\r\r` (only one of the carriage returns evidently get sent), I now send

```
\r\c "" \r\c "" \r\c
```

It looks like the above line sends one carriage return and expects nothing, sends another carriage return and expects nothing, and sends one more carriage return.

This seems to do the trick. The header comes flying by and I can then negotiate into the nuucp login. Because I can send files to the machine without any problem, uucp seems to work okay. However, mail does not seem to work. I have tried:

```
mail name!user and
mailx name!user and
rmail name!user
```

After I exit the mail programs, nothing happens. There are no log files created in the spool area, and the phone never goes off hook. It seems like the letter drops into a black hole! If uucp works, why doesn't mail work? (I am using ksh.)

#### DISCUSSION -----

Usually, people play trial-and-error on the "expect" and "send" strings in the L.sys to find communication line (modem or other device) characteristics, like "Connect", "Online", and other message outputs from the modem. uucico sends the "expect-send" pair of strings to the remote uucp host via the communication line. It depends on how the underlying communication device behaves itself. For example, does it require a carriage return or a new line or a couple of delays while in conversation mode? Below are special characters often used in the "expect-send" string:

```
\r    CARRIAGE RETURN
\d    DELAY for one second
\c    NO NL (No New Line)
```

A delay (`\d`) is sometimes needed for uucico to wait for the communication

line to complete its task before process the next string.

The "expected" and "send" string pairs are processed in that order. Yes, you may grab the last line of the display message as the "expected" string. For autobaud to work, you can try the "" \r\c "" \r\c "expect-send" sequences.

If uucp works, it does not necessarily mean that the "mail" should work. It depends on how the "sendmail" system is set up and configured. Is the "sendmail" program up and running on both machines?

The /usr/spool/mqueue/syslog file should record the reason for the mail problem. However, the /etc/syslogd daemon must be running to show the sendmail activity.

## MacX: Adding X Fonts (5/95)

Revised: 5/1/95  
Security: Everyone

MacX: Adding X Fonts (5/95)

=====

Article Created: 24 January 1991  
Article Reviewed/Updated: 1 May 1995

TOPIC -----

How and in what form are additional fonts added to MacX under A/UX and the Mac OS?

DISCUSSION -----

The procedure is identical for adding X fonts for both A/UX and Mac OS to the MacX Font Director list. The Font Director is built in MacX, which can be invoked by selecting "Fonts..." from the Edit menu. The Font Director lets you view, add, and remove existing Macintosh fonts to and from the font directory list. It also compiles fonts from the BDF (Bitmap Distribution Format) files.

To add "X fonts" into the MacX Font Directory list, the X font must be converted into a BDF file, so that it can be compiled by the Font Director and added into the font directory list.

The public domain software called "snftobdf" converts a SNF font file into a BDF font file.

## A/UX 2.0: Screen Dimmer Enhancement Request (6/92)

Revised: 8/13/93  
Security: Everyone

A/UX 2.0: Screen Dimmer Enhancement Request (6/92)

=====

Article Created: 24 January 1991  
Article Review/Updated: 31 June 1992

TOPIC -----

I am looking for A/UX-compatible screen-dimming software. I want it to be active once logged in and while at the login screen. For that to take place, will the application have to reside in multiple System folders?

DISCUSSION -----

We know of some screen dimmers, like "Blackout v1.21" and "Pyro 4.0", that work under A/UX 2.0. "AfterDark" seems to have a problem with "unsupported status csCode ..." if the SCRn resource is not removed.

"Blackout v1.21" seems to work under both "before" Login screen and "after" Login screen. For "Blackout v1.21" to work on both "before" and "after" Login dialog screens, the "Blackout v1.21" puts both folders (/mac/sys/'Login System Folder' and the /mac/sys/'System Folder') in the System folder.

## A/UX 2.0: 3270 Terminal Emulation

Revised: 11/10/92  
Security: Everyone

A/UX 2.0: 3270 Terminal Emulation

Article Created: 24 January 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

1) I am working on a Macintosh IIX with A/UX 2.0 and a Kinetics EtherPort II. The company where I work has lots of Sun systems, DOS machines, and IBM mainframes (even a few Crays). TCP/IP is the prevalent Comm protocol.

Using Telnet, we have no problem logging into IBM mainframes running TCP/IP. A/UX does not seem to have a 3270 terminal entry, so the 3270 screens don't appear as they should. Is there a 3270 type of term entry that will let the screens appear correctly under CommandShell?

2) I tried to use Intercon's TCP Connect II. This package does provide 3270 terminal types via Telnet. Running from A/UX, the program lets you log into a local Sun, but I can't seem to get across the router. The Intercon tech support engineer didn't have an answer other than running under Macintosh OS and setting the gateway address in the "Admin TCP" CDEV. Looking at the "MacTCP" CDEV under A/UX, the gateway field is 0.0.0.0 even though the route command has been run. Do you know why I can't get past the router from TCP Connect while running under A/UX?

### DISCUSSION -----

1) There is currently no 3270 termcap entry for a 3270 session in A/UX 2.0 /etc/termcap file.

However, there is a software package called tn3270, which, we believe, came with

the 4.3BSD distribution. It provides a solution for talking to IBM hosts running VM/CMS with the University of Wisconsin who developed TCP/IP codes. The tn3270 also includes a file called "map3270", which contains mapping between characters entered from the keyboard and 3270 keys used by the "tn3270" program doing 3270 emulation from UNIX. Tn3270 requires the 4.3BSD curses to run.

Porting 4.3BSD tn3270 to A/UX or using the third-party tn3270 product would be the ideal solution.

"Admin TCP" is not needed by A/UX 2.0 MacTCP since TCP/IP is configured by A/UX "ifconfig" and other network services, like Domain nameserver and/or gateway. You only need "MacTCP" in the System Folder.

2) We have no experience with the TCP/Connect II software. Is there any control file provided by TCP/Connect II to specify the gateway and/or the domain name server to be used? Like in NCSA Telnet 2.3, the "config.tel" file may contain information on gateways and name servers. We have tested the NCSA Telnet 2.3 with MacTCP in A/UX 2.0 to a remote host via a gateway (router) without any problem. The gateway information is generated by the A/UX "/usr/etc/route" or the /etc/in.routed" process as all information in A/UX MacTCP is disabled and can't be changed.

## AppleTalk: Configuring under A/UX (8/94)

Revised: 8/26/94  
Security: Everyone

AppleTalk: Configuring under A/UX (8/94)

=====

Article Created: 24 January 1991  
Article Reviewed/Updated: 26 August 1994

TOPIC -----

To configure AppleTalk under A/UX, must bnet be configured? If yes, is it a bug or are the protocols stacks linked?

DISCUSSION -----

Yes, to run AppleTalk you should have the "bnet" configured in the A/UX kernel. That means before doing "newconfig appletalk", the A/UX kernel must have been configured with "bnet". The reason is that AppleTalk modules link some modules from "bnet". The linked bnet modules include "m\_get", "m\_freem", and so on. In short, AppleTalk uses B-Net socket system calls to do inter-process communication for AppleTalk printing service. Note that the default A/UX 3.0 distribution is configured with "bnet" and "appletalk" driver modules.

It is not a bug; as you stated, the protocol stacks are linked.

## AppleShare Workstation Server Limit

Revised: 11/7/91  
Security: Everyone

AppleShare Workstation Server Limit

=====

Article Created: 1 March 1991  
Article Last Reviewed: 7 November 1991  
Article Last Updated: 7 November 1991

TOPIC -----

I have a program that automatically backs up our server volumes from a workstation. The problem is that I need all the volumes to be mounted on the workstation for the automatic back up to work. I want to run the software on a 2.5MB Macintosh Plus with an 80MB hard drive running System 6.0.3. I am trying to mount 8 volumes. When I try to mount the fourth volume, I get a message about not being able to open any more volumes.

What is the limitation? RAM? System software? Would a different computer help: Macintosh SE, Macintosh II? How many volumes should a workstation be able to mount?

DISCUSSION -----

There is a limitation in the number of servers that a given Macintosh computer can be logged on to at one time. The number of servers by machine is as follows:

| Computer           | Number of Servers |
|--------------------|-------------------|
| -----              | -----             |
| Macintosh Plus     | 3                 |
| Macintosh SE       | 8                 |
| Macintosh Classic  | 8                 |
| Macintosh Portable | 8                 |
| Macintosh LC       | 18                |
| Macintosh SE/30    | 18                |
| Macintosh II       | 18                |
| Macintosh IIX      | 18                |
| Macintosh IICx     | 18                |
| Macintosh IISi     | 18                |

|                         |    |
|-------------------------|----|
| Macintosh IIci          | 18 |
| Macintosh IIfx          | 18 |
| Macintosh PowerBook 100 | 18 |
| Macintosh PowerBook 140 | 18 |
| Macintosh PowerBook 170 | 18 |
| Macintosh Quadra 700    | 18 |
| Macintosh Quadra 900    | 18 |
| Macintosh Classic II    | 18 |

There is also a limit in the number of volumes you can have mounted. When a volume is mounted, information about that volume is loaded into System and Finder memory. The amount of memory needed to mount a volume is dependent on the size of and the number of files on that volume.

## Monitors: Effect of Variations in Earth's Magnetic Field (11/94)

Revised: 11/7/94  
Security: Everyone

Monitors: Effect of Variations in Earth's Magnetic Field (11/94)

=====

Article Created: 01 March 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I am planning to take a Macintosh monitor to Indonesia. An Apple Sales Representative told me I would have trouble with the monitor, if I took it South of the Equator. Is there any truth to this, and, if so, how could the monitor be readjusted?

DISCUSSION -----

Variations in the Earth's magnetic field will cause some problems when moving a monitor intended for use in the Northern hemisphere to the Southern hemisphere.

If you buy the monitor in the Northern hemisphere, you will probably see rounded corners and curves where straight lines should be. There is no service procedure for re-adjusting the display to correct these problems. Your best bet is to buy or borrow a monitor for use South of the Equator.

DAL 1.0, 1.1: Incompatibility with HyperCard 2.0

=====

Article Created: 4 March 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

I found a bug with HyperCard 2.0 and DAL (formerly called CL/1). Evidently, the cllputval XCMD does not actually return data to HyperCard 2.0. The cllgetlist XCMD does, however. I am running DAL 1.0, because we have a VMS 4.7 system and cannot upgrade for a variety of reasons.

DISCUSSION -----

The DAL Support group told us that there were known incompatibilities between DAL version 1.0 or 1.1 with HyperCard 2.0. Because you cannot upgrade to a later VMS release to run DAL 1.2, we suggest you not use HyperCard 2.0 with DAL 1.0.

## A/UX and Raw Sockets (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX and Raw Sockets (8/94)

Article Created: 24 January 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

I want to use raw sockets in A/UX so that I can set up a TCP/IP address server. I want to use the raw sockets to check dynamically on the availability of a TCP/IP address and load an available address into a particular platform.

DISCUSSION -----

This sounds like a developer programming issue. The "A/UX Network Application Programming" documentation is a good reference for writing sockets which include Stream, Datagram, and Raw sockets. It also includes some sample C code. Section 11 of 4.3BSD "Networking Implementation Notes" describes details on what raw sockets are, what their control block structure is, and how the input and output raw sockets are processed. These notes regarding how raw socket addresses are handled might be of interest:

A raw socket interface is datagram oriented. That is, each send or receive on the socket requires a destination address. This address may be supplied by the user or stored in the control block and automatically installed in the outgoing packet by the output routine. Since it is not possible to determine whether an address is present or not in the control block, two flags, RAW\_LADDR and RAW\_FADDR, indicate if a local and foreign address are present. Routing is expected to be performed by the underlying protocol if necessary.

You should also examine the rules of raw socket input and output processing and see if the rules fit their TCP/IP applications.

The "A/UX Network Applications Programming" document and "A/UX Development Sources" Version 2.0 on CD-ROM are available from APDA. If you need immediate assistance on developing their socket codes, we suggest that, as a developer, you contact MacDTS (Macintosh Developer Technical Support).

Macintosh Classic, Macintosh LC: Power Supply Specs

Article Created: 24 January 1991  
Article Last Reviewed: 23 June 1992  
Article Last Updated:

TOPIC -----

Would you please supply the specifications for the Macintosh Classic and Macintosh LC power supplies, showing the maximum currents which can be drawn from the different voltage sources (+5, +12, etc).

DISCUSSION -----

Here is the information you requested:

### MACINTOSH CLASSIC

| Load Condition | +5 V    | +12 V   | -12 V   |
|----------------|---------|---------|---------|
| -----          | ----    | -----   | -----   |
| Minimum load:  | 0.5 A   | .010 A  | 0.010 A |
| Maximum load:  | 3.489 A | 0.550 A | 0.060 A |
| Peak load:     | 3.717 A | 1.070 A | 0.080 A |

### MACINTOSH LC

| Load Condition | +5 V   | +12 V  | -5 V | Total Power |
|----------------|--------|--------|------|-------------|
| -----          | ----   | -----  | ---- | -----       |
| Minimum load:  | 0.5 A  | 80mA   | 0mA  | 3.46 W      |
| Maximum load:  | 3.25 A | 0.75 A | 75mA | 25.625 W    |

|            |         |          |      |          |
|------------|---------|----------|------|----------|
| Peak load: | 3.50 A* | 1.40 A** | 75mA | 34.675 W |
|------------|---------|----------|------|----------|

\*\* At turn-on: For a period of 5 seconds maximum, Duty cycle to be 10%, the +12 V supply may drop to 11.0 volts during the +12V peak load.

\* During normal operation: For a period of 1 second maximum, duty cycle to be 20%, +5V output to remain within 5.05V +/- 5% during the +5V peak load.

## MacDFT: Problem with Apple 12-Inch RGB Monitor

Revised: 3/4/91  
Security: Everyone

MacDFT: Problem with Apple 12-Inch RGB Monitor

=====

This article last reviewed: 25 January 1991

TOPIC -----

Is MacDFT 1.1.1 compatible with the new Apple 12-inch color monitor?

If I open a dialog like Display or Keyboard, I don't get the whole box in the picture. If I then open and close it repeatedly, the whole text moves upwards, so after a few tries I don't see any text at all.

If I check Resize Fonts, nothing changes. How is that supposed to work? I thought that if I checked that, MacDFT would change the font size, if you changed the window size.

DISCUSSION -----

We found there are some display problems when using MacDFT with an Apple 12-inch RGB monitor, for example the menu items Display and Keyboard aren't fully displayed on the screen. However, we didn't find limitations so severe as to prevent you from using this combination. We reported this problem to Engineering.

When you check the Resize Fonts option, the text on the screen will not change point size as you shrink or enlarge the window. Instead your options are:

Resize font: unselected

-----

If you use this default setting, the window changes to accommodate the rows and columns. The font size remains the same size chosen from the Font size menu. This choice lets you display the full column width associated with each model type, except for Model 5, where you must use the horizontal scroll bar to see all 132 columns.

Resize font: selected

-----

If you select this option, MacDFT changes the font size to fit the terminal model you have selected. If you choose this option, you can see all your columns and rows. In some cases, the window may not be able to display all the rows and columns, and you must use the scroll bars to display some data. The window size also changes to accommodate the extra rows and columns.

Both of these options are described and illustrated in the "MacDFT User's Guide."

SMB: AFE Window Shows Only 8 Entries

=====

Article Created: 24 January 1991  
Article Last Reviewed: 3 April 1991  
Article Last Updated: 3 April 1991

TOPIC -----

Since updating our SMB file server with OS/2 LAN Server software v1.2 we've had a problem with Apple's SMB File Transfer (v1.0). With SMB File Transfer software we can log onto the server, display and transfer files; however, only the first eight entries (files or folders) for a particular directory are displayed.

DISCUSSION -----

What you have described is a known limitation of using SMB File Transfer with OS/2 LAN Server versions 1.2 or later. Alternatives include using third party products on the Macintosh such as MacLAN Connect from Miramar to access the OS/2 LAN Server. Otherwise, at this time you will be required to limit directories to no more than 8 items.

For more information on MacLAN Connect, go to the Tech Info Library and search under "Miramar".

## ImageWriter Emulator: Requires EOF Character

Revised: 3/4/91  
Security: Everyone

ImageWriter Emulator: Requires EOF Character

=====

This article last reviewed: 25 January 1991

TOPIC -----

We are having difficulty printing to a LaserWriter using an Apple IIGS and the ImageWriter emulator.

The school system for which I work is using DB Master Professional from Stone Edge Technologies and is trying to print out reports to an Apple LaserWriter using the ImageWriter Emulator. My original problem was that I could get one copy to print out, but when I tried printing again, all I would get was blank paper.

I think the problem may be is with the EOF character. Does the LaserWriter require an EOF character? If so, does the ImageWriter Emulator supply the EOF character, or is that the responsibility of the software package?

DISCUSSION -----

The LaserWriter requires an EOF character (in this case Form Feed, ASCII 12). The ImageWriter Emulator does not supply this character; it must be supplied by the application doing the printing. Stone Edge should be able to help you configure the software to do this.

## MacPAD: Changing Default Parameters

Revised: 3/4/91  
Security: Everyone

MacPAD: Changing Default Parameters

=====

This article last reviewed: 25 January 1991

TOPIC -----

I need to change the MacPAD parameter 3: "Data Forwarding Character" to "after each character" but the software doesn't offer a menu for this. I'm assuming the defaults are stored somewhere in the resources of MacPAD. I need to know where and how these PAD parameters are stored in the resources, so I can change the default parameters.

DISCUSSION -----

Because of the way the parameters like "Send data on every alpha-numeric character" are stored in MacPAD, they cannot be modified easily with ResEdit. Furthermore, as soon as a connection is established, the other side might use X.29 to modify the parameter anyway.

Macintosh Communications Toolbox applications, like MacTerminal 3.0, can save Settings or MacPAD parameters when you choose "Save Changes". Looking at the "Comm Toolbox Reference" manual, config and oldConfig point to the MacPAD private data block, which is called automatically when you create a connection record (CMNew automatically makes two calls to CMDefault to fill in config and oldConfig). Your program needs to store the contents of config to save the state of the connection tool.

The above assumes you are using MacPAD at all. Perhaps the program writes directly to the X.25 Interface Library? If so, your program then must assume more responsibility in setting up and tearing down the call. Lastly, the CCITT X.28 allows for only certain PAD profiles and to impose other profiles that may violate the specification.

## MacX: Repainting Rooted and Rootless Windows

Revised: 3/4/91  
Security: Everyone

MacX: Repainting Rooted and Rootless Windows

=====

This article last reviewed: 25 January 1991

TOPIC -----

Does our Apple X11 server (MacX) store the window image locally, so the window can be repainted locally if it is clipped, or does the host have to send down the image to repaint the screen?

DISCUSSION -----

There are three possible scenarios involved in this question, depending on the window types you have specified.

If you have rootless windows (in other words, each X-client application is running in a separate Macintosh window), then each window's image is stored locally in an offscreen bitmap. This prevents the necessity of having the client application redraw the information.

The next two scenarios involve rooted windows, which are two different issues.

The first issue is what happens to the entire rooted window when it is forced to update itself. In this case, the currently-displayed rooted window's image is stored in an offscreen bitmap, and the updates are done locally and not by the client applications. This is consistent with the method used by the rootless windows as mentioned above and is necessary, because X client applications are typically not prepared to deal with changes to the root window itself.

The second issue is involved with multiple X-client windows within the single Macintosh root window. In the situation where you have overlapping X windows within the rooted window, and you are switching between the windows, the client applications are responsible for updating the clipped regions just as they should be.

Perhaps the best way to think of this is that the images contained within Macintosh-style windows are stored locally.

Macintosh Classic: Boot ROM Option Is Not a Supported Feature

=====

Article Created: 25 January 1991  
Article Last Reviewed: 16 June 1992  
Article Last Updated:

TOPIC -----

I'm testing some features of the Macintosh Classic; in particular, the Boot ROM option (Command-Option-X-O). It's really fantastic, but we (outside the U.S.) have a problem with the International Resources such as keyboard resources. When booting from ROM, you are automatically in QWERTY mode. It's "normal," but what can be done for people who are using AZERTY or something other than a QWERTY keyboard?

DISCUSSION -----

The Boot ROM option isn't a supported feature in either domestic or international versions of the Macintosh Classic. The code was part of an experiment in future directions and wasn't taken out before the ROMs were finalized.

Because the software in use was not fully tested with the Macintosh Classic, we don't recommend its use in any way.

Macintosh RS-422-to-RS-232-C Adapter

=====  
Article Created: 25 January 1991  
Article Last Reviewed: 10 June 1992  
Article Last Updated: 10 June 1992

### TOPIC -----

I am trying to attach some Macintosh computers to a AT&T ISN network. The ISN requires an RJ-45 connector. We are having two problems.

- 1) According to the article "Macintosh Mini-8-to-RJ-45 Connection", "To do this, you need some kind of adapter." Is there a way to build a RS-422-RJ-45 cable without an RS-232 adapter in the middle?
- 2) Is there a consistent difference between computers in the Macintosh II family and Macintosh SE computers in terms of distance tolerance for RS-422? We get a Macintosh SE to work in situations where a Macintosh IIfx will not. My thought was similar to that in another article on serial port cable length specifications. That is, we were a little over the distance spec and the Macintosh SE seems to be able to handle that. Word on the Internet is that people have to make different cables for the Macintosh II than for the Macintosh SE in these situations.

### DISCUSSION -----

Because the built-in Macintosh serial ports are based on RS-422, which uses differential signals, a simple rule should be followed to assure compatibility with RS-232-C devices. Ground the RD+ line and leave the TD+ line disconnected. This converts the port to RS-423, which is compatible with almost all RS-232-C equipment.

The adapter spoken of in the article you referenced merely adapts the different connector types: RJ-45 to DB-25. The grounding of RD+ was done by the Mini-8 to DB-25 adapter. The following diagram shows the proper cable configuration for connecting a Macintosh serial port to an RS-232 device:

| Macintosh Mini-8 Port |        |     | 25 Pin RS-232 DTE Device |           |                             |
|-----------------------|--------|-----|--------------------------|-----------|-----------------------------|
| Signal Name           | Signal | Pin | Pin*                     | Signal    | Signal Name                 |
| -----                 | -----  | --- | ---                      | -----     | -----                       |
| Handshake Out         | HSKo   | 1   | ----                     | if needed | ----> 6 DSR Data Set Ready  |
| Handshake In          | HSKi   | 2   | <----                    | if needed | ---- 20 DTR Data Term Ready |
| Transmit -            | TD-    | 3   | -----                    | ----->    | 3 RD Receive                |
| Receive -             | RD-    | 5   | <-----                   | -----     | 2 TD Transmit               |
| Transmit +            | TD+    | 6   | Not connected            |           |                             |
| Signal Ground         | SG     | 4   | -----                    | -----     | 7 SG Signal Ground          |
| Receive +             | RD+    | 8   | -----                    |           |                             |

\*Note that the pin assignments shown may be wrong if the RS-232 device is wired as DCE instead of DTE. Since we don't know how the RJ-45 connectors are wired, we can't provide pin assignments for them. However, the signal assignments will be the same, so you can translate pin numbers from the signal names.

Although both Macintosh ports usually work with RS-232-C equipment without the considerations mentioned above, their maximum cable lengths and resistance to noise and interference are reduced. The approximate 50-foot length limitation may be reduced drastically and reliability can be impaired.

We have noticed that the Macintosh SE and earlier models are slightly more tolerant of cable design. While the Macintosh II family serial ports are capable of the 50-foot maximum cable length RS-232-C specification, this requires the cable to be designed as shown above. If RD+ is not grounded, the maximum length will be reduced. The Internet community discussions you mention are probably based on a partial understanding of these factors.

## A/UX: MacX and Native X Performance (9/94)

Revised: 9/20/94  
Security: Everyone

A/UX: MacX and Native X Performance (9/94)

Article Created: 25 January 1991  
Article Reviewed/Updated: 19 September 1994

TOPIC -----

I need to optimize an A/UX system for running X Window System applications in the following environments:

- 1) Running Native X Window System under A/UX on a Macintosh IIfx, running with 16MB or 32MB of physical RAM.
- 2) Running MacX in the Finder under A/UX on Macintosh IIfx, running with 16MB or 32MB of physical RAM.

The applications are X based, using pull-down menus extensively. Of the two, running under MacX is going to be weighed most heavily. I will be using the MacX 1.2 that comes with A/UX.

Does running the same application in a rooted color window versus rootless color window affect performance one way or the other?

I've used the following method to optimize A/UX for Native X Window System under 8MB of memory:

For systems with 8MB, bring A/UX up as single-user, then run these commands:

```
# kconfig -n /unix
NBUF=2500
NINODE=600
NFILE=400
<Control-D>
# sync
# sync
# sync
```

# reboot

When doing this though, MacX performance under A/UX on the same machine crawls slower than before.

#### DISCUSSION -----

Performance should not be affected when selecting a rootless color window or a rooted color window when running the same X client application.

The above kernel parameters, especially NBUF=2500, seems to be too high for an A/UX 8MB system. The "NBUF=2500" itself takes up 5MB (2500 x 2K) of existing memory. When you add the other kernel parameters, there is not much available physical memory left for applications. This will cause more paging activity and, in turn, degrade the performance.

If you have 16MB or 32MB of physical memory on a Macintosh IIx running A/UX 3.0, the same kernel parameters configuration should be feasible to run either X11 Window System or MacX under A/UX.

The system performance will really depend on how many X client applications and other applications, including Macintosh applications and UNIX processes, are running at the same time in A/UX and the underlying network environment in which A/UX resides. The following kernel parameters should be adjusted accordingly to fit your running environment:

NBUF    If NBUF=0, it allocates about 10% of free memory for disk block I/O buffers.

NFILE   is the size for system file-table pool (600 seems fair enough).

NINODE   is the size for system inode-table pool (400 seems fair enough).

NPROC   is the maximum number of processes allowed in the system.

MAXUP   is the maximum number of processes per user allowed in the system.

NMBUFS   is the maximum number of buffers allocated for networking.

Each NMBUFS buffer requires 256 bytes. The more network daemons running, the more mbufs are needed for memory allocation.

Since both MacX and X11 must be run at least in an A/UX B-Net kernel, the NMBUFS must be set fair enough for the network buffering. By default, 500 mbufs are allocated. For an A/UX with NFS and/or YP A/UX kernel, the NMBUFS needs to be increased significantly, say 1000 or 1500.

The "netstat -m" can be used to display the number of mbufs currently in use.

Also, the "pstat -m" command can be used to display information about the current memory allocations, which include the number of I/O buffers (NBUF) allocated, the number of inodes (NINODE), and the file (NFILE) currently active.

## A/UX 2.0: fcnvt May Create Bad MacBinary Header (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX 2.0: "fcnvt" May Create Bad MacBinary Header (8/94)

=====

Article Created: 25 January 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

The 'fcnvt' tool supplied with A/UX 2.0 sometimes creates a MacBinary file with a bad header. Attempts to download this file to a program that receives MacBinaries (like Microphone) fails, in that it does not recognize the file as a MacBinary file. This seems to occur usually when converting a BinHex file (like one downloaded off of USENET) to MacBinary with the following command:

```
fcnvt -i hex -m filename
```

DISCUSSION -----

Look at the MacBinary file that is created, and you'll notice that byte \$4A is non-zero, which is incorrect, according to the MacBinary Standard. Also, byte \$49, which should contain some of the Finder flags, usually seems to contain incorrect information. Setting byte \$4A to zero seems to fix the problem--the file will then successfully download. Note that when creating a MacBinary from an AppleSingle file, these two bytes seem to be okay and the file downloads okay.

Security: Everyone

Applesoft BASIC: Moving a Listing to a Macintosh and Back

=====

Article Created: 25 January 1991  
Article Last Reviewed: 11 August 1992  
Article Last Updated:

TOPIC -----

I would like to use a Macintosh word processor to edit Applesoft BASIC files from the Apple II environment. Is there a translator to take "tokenized" Applesoft BASIC files and have them appear on the Macintosh? The tokens (PRINT, DISPLAY...) don't seem to get translated when files are moved to the Macintosh. The original version of Passport (Apple File Exchange) had that capability.

DISCUSSION -----

We don't know of an AFE Translator for Applesoft BASIC files to Macintosh text files. You can get around this limitation by "printing" the Applesoft program files to a disk file before the AFE conversion. After editing on the Macintosh, transfer the files back to the Apple II. Then, EXEC each file to make it an Applesoft file. To do this, add the following code to the existing Applesoft program:

```
1 D$ = CHR$(4)
2 PRINT D$; "OPEN PGM.LIST"
3 PRINT D$; "LIST"
4 GOTO 32766
.
.
add the existing Applesoft program here
.
.
32766 PRINT D$; "CLOSE PGM.LIST"
```

The entire Applesoft program will be saved in a text file called "PGM.LIST" and can be converted to a Macintosh format for editing.

After editing is complete, transfer the file back to Apple II text format using the file name "EDITED.FILE". Use the EXEC command to turn the text listing into an Applesoft program in memory.

```
] EXEC EDITED.FILE
```

Be sure to SAVE the program to disk or the EXEC step will have to be repeated each time the user wants to run the program.

## MacTCP: Using DDP/IP Gateway to Get Dynamic IP Address

Revised: 3/19/91  
Security: Everyone

MacTCP: Using DDP/IP Gateway to Get Dynamic IP Address

=====

This article last reviewed: 28 January 1991

TOPIC -----

In MacTCP, you can choose to set the addresses dynamically. If you do this, when does the server let go of that address? My problem is that every node that logs on never lets go of an address--so in a short time, all addresses are taken although only a few people are logged on.

DISCUSSION -----

When you choose to have MacTCP use a DDP/IP gateway to get a dynamic IP address, the address assignment is completely controlled by the DDP/IP gateway. Each DDP/IP gateway may work slightly differently in its address allocation and de-allocation schemes.

For example, the Shiva FastPath running KIP will de-allocate an allocated IP address if it cannot contact the AppleTalk based Macintosh for 5 minutes. It keeps an NBP ARP table which contains one AppleTalk net/node number entry for each dynamic IP address for which it has allocated an address. It then uses this list to contact the AppleTalk-based Macintosh once every 2 minutes to find out if it's still alive and active. If it cannot contact the AppleTalk-based Macintosh, it then frees the IP address for reuse.

I'm not sure what DDP/IP gateway you're using, but it should not be acting the way you describe.

## AppleTalk: Worldwide Network Issues

Revised: 3/19/91  
Security: Everyone

AppleTalk: Worldwide Network Issues

=====

This article last reviewed: 28 January 1991

TOPIC -----

I have three questions involving AppleTalk on a worldwide network at a top investment bank:

- 1) Are file accesses across the net controlled by AppleShare, or is something else controlling the file access?
- 2) When the packet-switched network re-routes lines, we can experience delays of 5 minutes or more. The connections re-route, but usually we seem to lose our network file connection. What happens to an AppleShare request when its response is delayed for that long? We saw (using a datascope on the line) that if the request for servers timed out, the response was ignored. Does a similar situation take place in the case of a read?
- 3) Does the modification to the GNRL resource affect only the initial call? If the server becomes available quickly, does that shorten the time-out that AppleShare will use for all server access while the server is mounted?

DISCUSSION -----

- 1) AppleShare (AFP calls) controls all access to the remote files, including the handling any time-out values associated with the function of accessing a file. By "controlled", we assume you mean any function that pertains to successfully opening, reading, or writing to a file stored on an AFP server. There are many AppleTalk protocol functions associated with AFP transactions that are not directly considered a controlling aspect of manipulating a remote file. These functions do not control access to the individual files so much as they control access to the media being using to transport the AFP calls.

If you are using standard file system calls and if the file you're trying to access is located on an AFP server, all local file system calls such as PBOpen, PBRead, FSRead, etc. are filtered out and transformed into equivalent AFP calls.

- 2) The 5-minute delay is going to present a real problem to AppleShare, or to be more precise to the ASP protocol. The session timer for an AppleShare file server connection is set to 2 minutes. Once this timer expires, the session will terminate, and you will lose your server connection. The retry count for the read request is set to infinite, so a read request never really times out.

The session timer is restarted each time a tickle packet is received by either the workstation or the server. Tickle packets are sent out every 60 seconds by both the server and the workstation as part of the ASP protocol, to allow a way of detecting that the other end of the connection has gone down. There is no easy way to reset this timer value.

- 3) If you modify the GNRL resource in the AppleShare chooser document, it will affect every NBP lookup that is done from the Chooser. The Chooser uses these values to determine the NBP lookup interval and retry values for the current NBP transaction. The default of 0705 tells the chooser to send 5 NBP lookup requests at an interval of 7/8 second. This process is repeated in an infinite loop until the user closes the Chooser.

#### Chooser Event Flow Example:

User opens chooser and selects the AppleShare CDEV  
GNRL resource -4096 loaded = (5002)  
NBP look up mechanism started

#### NBP Loop:

Get NBP ID for this transaction  
(Note: All NBP request and replies for this loop will use this ID)

Send first look up (NBP ID = "New")  
Collect and display responses from the NBP look up ID "New"  
Wait 10.6 seconds

Send second look up (NBP ID still = "New")  
Collect and display responses from the NBP look up ID "New"  
Wait 10.6 seconds

Discard all buffers and data associated with NBP ID "New"  
(Note: If a response is received for NBP lookup ID = "New" after this point the reply data would be discarded and the device would not be added to the list in the Chooser.)  
Do some other misc. cleanup (approximate time, 1 second)

goto NBP Loop

End NBP Loop:

With the retry timer set to such a large value, the multiple retry count is really not necessary. On the other hand, it doesn't hurt anything either, and it effectively increases the time you'll wait for NBP replies to over 20 seconds for the current transaction. The idea behind the retry count is to send several lookup requests in quick succession (default is less than 1 second) in case there are devices which cannot respond, because they are busy or because the previous packet never reached them.

The reason that increasing the interval timer helps in the case of remote servers is directly tied to the way the NBP mechanism works. The chooser maintains only 1 NBP lookup request at a time, tracking all replies to that request by way of the NBP ID mechanism. Replies that are received that do not match the current request ID are discarded. The request ID is maintained only for the current NBP request; the interval and retry counters for this request can be tuned via the GNRL resource. In other words, if you set the retry counter to 10 and the interval timer to 50, the NBP ID would be maintained for 10 requests at an interval of 10.6 seconds. The GNRL resource is documented in "Inside Macintosh, Volume 4," page 216.

## Font Substitution Disabled with Fractional Widths On

Revised: 3/19/91  
Security: Everyone

Font Substitution Disabled with "Fractional Widths" On

=====

Article Created: 28 January 1991  
Article Last Reviewed: 13 July 1992  
Article Last Updated:

TOPIC -----

My PostScript printer won't print using Font Substitution when printing from a Macintosh Plus. "Fractional Widths" are set to on, thus preventing Font Substitution from occurring.

I need a way to turn off Fractional Widths without using some program like Microsoft Word. Our office uses MacWrite versions 4.5 and 5.0. We want to compose documents in Geneva and print with a PostScript font (Helvetica).

Is there some INIT or small program that turns off Fractional Widths to allow Font Substitution? Alternatively, is there a good, readable, public-domain, bit-mapped Font that will substitute for the bit-mapped Helvetica? With it, can I create documents in this font and print them in Helvetica with Fractional Widths on?

DISCUSSION -----

You raise a couple of issues we'll attempt to address below.

You mention a problem that your print job won't "print" when you use Font Substitution. During our experimentation, we encountered an intermittent bug with MacWrite. Text imported to it via the Clipboard (copy and paste) didn't always print, regardless of whether font substitution is on or off.

The print job would appear to download to the printer OK, but the job would flush without printing (blank paper comes out of the printer). This is a problem Claris is aware of, and they recommend saving the document to a text format from whatever application you are using, then opening the file from within MacWrite.

You state that when Fractional Widths is enabled, font substitution will not occur. This is a correct response. Font substitution is disabled in all cases where fractional pixel widths are enabled. The default for Fractional Widths is disabled. It is the domain of the application to enable it if desired.

We don't recall ever seeing a utility that will toggle SetFractEnable on and off, but such a program doesn't make a lot of sense to us, as each program needs to call SetFractEnable in the Macintosh ROM. One application's setting will have no effect on another program's setting.

We don't think substituting a bitmapped LaserWriter font will help here. Aside from the printing problem you report, one possible workaround is to select Helvetica as a screen font, so no font substitution will be required at all when printing. To this end, Claris made Helvetica the default font in MacWrite II. MacWrite has no provision for turning off fractional widths. However, MacWrite II does have this ability. Upgrading to MacWrite II may be another option.

Another alternative is to change the document's font to Helvetica prior to printing, perhaps using a program like QuicKeys to streamline the operation if desired.

## AppleShare: Product to Limit Concurrent Launches

Revised: 8/13/91  
Security: Everyone

AppleShare: Product to Limit Concurrent Launches

=====

Article Created: 28 January 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a question about shared applications on an AppleShare server. I want the ability to restrict the number of concurrent launches of an application to the number licensed from the application's vendor. We know that AppleShare doesn't do this now, and the Macintosh OS doesn't necessarily support this function either.

OS/2 LAN Manager has this capability, and people are using this function to save money and reduce support costs by having only one copy of the application to update for all of its DOS users on the network.

Do you know of any third-party utilities that will restrict the number of concurrent launches to an application on a server? Granted, application vendors don't normally license their software this way. However, I could still purchase x number of copies of an application and then impose the limit of x concurrent launches of the application and still save money on the support costs and the reduce the total number of copies that would be needed.

DISCUSSION -----

You are correct that AppleShare doesn't now limit the concurrent number of times an application is launched.

AppleShare Product Management brought to our attention a product described in the following article (by Eric J. Adams) from the March 13, 1990, issue of MacWEEK:

"Hanover, N.H.--A Dartmouth College math professor has developed a network-based software-management program that solves several problems

associated with distribution and piracy prevention.

"The program, called KeyServer, is now in use at Dartmouth, and its developer, Dr. Denis Devlin, hopes to begin commercial marketing later this year.

"KeyServer's installation program lets administrators modify popular applications, based on the provisions of their site license, so they will run only after receiving a "launch enable" message over the network. To launch copies of modified programs from a local hard disk, each user must have a "network pass," which is installed as a Startup document (INIT) in the user's system folder.

"If the maximum number of users allowed by the site license is using the program simultaneously, KeyServer will not give access to a prospective user. Instead, it passes a message that "All licensed copies are currently in use." When the program is freed, KeyServer returns a pop-up message to the prospective user, indicating that a launch is possible.

"KeyServer also allows network administrators to monitor current software access and generates a usage log, which can be used to negotiate or renegotiate site licenses with vendors, Devlin said. Several large vendors have expressed interest in the program, he added.

"It allows us to make a wide variety of software available without having to put a lot of money down for a site license on a bet that the program will be used," said Larry Levine, director of user services for the more than 5,000 Macintoshes on-line at Dartmouth. "We can freely distribute copies of programs without giving away control of their use."

"KeyServer differs from other Macintosh software management programs because "Only the command to launch comes over the network," Devlin said. "The programs reside on the user's hard disk, cutting down on network traffic tremendously."

"KeyServer also allows the administrator to turn access to a program on or off for any length of time or to shut off access to old versions of software. The program does not require a dedicated server.

"Devlin is currently beta testing KeyServer at industry sites and negotiating licensing agreements with vendors. Through his company, Sassafras, Devlin hopes to have shrink-wrapped versions ready by summer. Though pricing has not been set, Devlin said it will be tied to the number of nodes per network."

## Display Card 8•24GC Works with the 12-Inch RGB Monitor

Revised: 5/1/95  
Security: Everyone

Display Card 8•24GC Works with the 12-Inch RGB Monitor

=====

Article Created: 10 January 1991  
Article Reviewed/Updated: 1 May 1995

TOPIC -----

Does the 8•24GC card support the 12-inch RGB monitor?

DISCUSSION -----

The 12-inch RGB monitor and the 8•24GC card work very well together.

For several weeks now, we have used the Macintosh 12-inch RGB Display with both the 8•24 and the 8•24GC cards. We have had no difficulty in using either card with this monitor. I have tried different 12-inch RGB Displays, all with complete success.

## DAL 1.2: Working with VAX Rdb/VMS Run-Time Version

Revised: 6/29/92  
Security: Everyone

DAL 1.2: Working with VAX Rdb/VMS Run-Time Version

=====

This article last reviewed: 29 June 1992

TOPIC -----

Will DAL (Data Access Language) 1.2 work with a run-time version of VAX Rdb/VMS? Or does it require the full development version?

DISCUSSION -----

Data Access Language 1.2 should work with either version of VAX Rdb/VMS, whether run-time or full-development version. The full-development version of VAX Rdb/VMS lets you design and maintain Rdb databases while the run-time version lets end-users use (query, update) Rdb databases only.

Data Access Language: Union Command Not Supported

=====

Article Created: 19 March 1991  
Article Last Reviewed: 30 June 1992  
Article Last Updated: 30 June 1992

### TOPIC -----

I have found a problem with the DAL "Union" command. A query returns a syntax error, requesting that I enclose the "Union" keyword in semicolons. When I do this, I get another error that the procedure "Union" is not defined. Any suggestions?

### DISCUSSION -----

As of release 1.3.5 of the DAL servers the SQL "Union" statement is supported for all DBMSes which allow it.

## A/UX: Problem Printing to ImageWriter from Mac OS (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: Problem Printing to ImageWriter from Mac OS (9/94)

=====

Article Created: 19 March 1991  
Article Reviewed/Updated: 8 September 1994

### TOPIC -----

I am running A/UX on a Macintosh IIfx. If I switch from A/UX to the Macintosh OS and try to print from a Macintosh application to the ImageWriter (connected via the printer port) the system won't print.

### DISCUSSION -----

If the system prints in A/UX but not in Macintosh OS, make sure that the direct, serial-printer driver for the ImageWriter is installed and configured properly.

If the printer does not print in A/UX either, we know of a problem when the printer is directly connected to the PRINTER port under either mac32 or mac24 environment (print from a Macintosh application). However, there is no problem on the direct connect MODEM port.

## AppleShare PC: How to Print Color

Revised: 3/19/91  
Security: Everyone

AppleShare PC: How to Print Color

=====

This article last reviewed: 1 February 1991

TOPIC -----

Is it possible to print to a color printer through AppleShare PC? I am running a PS/2 with AppleShare PC 2.01, Windows 3.0, and Paintbrush from Windows connected to an NEC Colormate printer. If I configure the Paintbrush from Windows to print black and white, I can get a printout, but it doesn't work in color mode.

DISCUSSION -----

As you know, the two types of printing that AppleShare PC supports are PostScript and Epson LQ2500 emulation. The PostScript mode assumes your application knows how to communicate correctly using PostScript and just passes the data to the printer without modification. This is called pass-through mode.

Epson LQ2500 emulation works a bit differently, in that AppleShare PC must translate the plain text and Epson printer control codes into text and codes for the printer being used; PostScript LaserWriters and ImageWriters are supported.

In the case of LaserWriter Epson emulation, an Epson emulation dictionary is downloaded at the start of each job. Once this is done, the print data is sent to the emulation dictionary for interpretation and printing. Because ImageWriters have essentially no processing abilities, they require AppleShare PC to do all the translation for them. Unfortunately, no color emulation features are provided in either mode.

The only way we can think of to get color printing from AppleShare PC would be to use a color PostScript printer with software that supported it. Since AppleShare PC just passes the PostScript print data to the printer, it will let any PostScript data, color commands included, be sent.

VAX/VMS: How to Set Up Dial-Up Port for DAL

=====  
Article Created: 19 March 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

What is the configuration on MicroVAX 3100 for setting up remote login through a modem?

I need dial into the VAX at my office from a customer site to demo Data Access Language. I have tried to set up terminal TTA2 as remote terminal without success.

DISCUSSION -----

The procedure to set up a dial-up port is the same on VAX/VMS operating system, independent of what processor you have. The difference is the name of the terminal port you are going to use. For the process to work, the terminal port must support modem control.

On the MicroVAX 3100, terminal port TTA2 supports modem control. The following command should work:

```
$ SET TERMINAL/PERMANENT/DEVICE=VT100/MODEM/HANGUP/SPEED=2400 TTA2:
```

You may substitute the device name and the speed to whatever values you are using.

Also, make sure that the cable to the modem has the correct pins wired to support modem signals. One such modem cable is the Digital BC22E-xx where xx is the cable length in feet. It is a round, 16-wire, fully shielded, EIA-232-C/CCITT V.28, male-to-female molded connectors cable for connection of asynchronous modems.

If after trying this solution, it still does not work, you might want to

have Digital Field Service check to see if your terminal port is bad.

## IBM 8209/AppleTalk: Support Alert Information

Revised: 3/19/91  
Security: Everyone

IBM 8209/AppleTalk: Support Alert Information

=====

This article last reviewed: 1 February 1991

TOPIC -----

IBM has a relatively new product, model 8209, that is a media access control (MAC) sub-layer bridge. Most likely encountered in a Token-Ring to Token-Ring bridging configuration, it also can be configured for Token Ring to Ethernet. Do you have any details?

DISCUSSION -----

We recently had the opportunity of observing/troubleshooting such an environment involving an 8209, an IBM mainframe on Token Ring supporting TCP/IP, Macintoshes running both Phase 1 and Phase 2 AppleTalk on Ethernet, Macintoshes on Token Ring, and a variety of TCP/IP hosts on Ethernet. This leads to several interesting discoveries.

IBM 8209 and AppleTalk

-----

Ideally, with the 8209 providing Token-Ring-to-Ethernet bridging services, Macintoshes on both transports would see the bridged network as a single logical network. Unfortunately, for a number of reasons, this is not true.

The first problem stems from the 8209's generosity in forwarding all datalink (MAC) broadcasts and multicasts. If you are running ANY Phase 1 EtherTalk, adding an 8209 into the net automatically generates Phase 1 TokenTalk. This is useless traffic, because the TokenTalk drivers expect Phase 2 protocols. As far as we can tell, it is not dangerous traffic--it is safely ignored by all nodes. But it does take up bandwidth, and if the Phase 1 Ethernet is large and has many routers, there can be significant broadcast traffic forwarded onto the Token Ring.

The answer here would be to filter Phase 1 EtherTalk at the 8209.

Token Ring and Ethernet do not agree on the order of bits. So, the 8209

flips the bits of the (MAC) datalink-level addresses when it forwards the packets. Normally, this affects only the destination and source addresses in the packet header. However, address resolution protocols like TCP/IP ARP and AppleTalk's AARP also carry MAC-level addresses as a part of their data portion of the packet.

The 8209 is specially programmed to look for TCP's ARP and to go down inside the data, flipping the bits of the embedded MAC address. Later, when a Token Ring host wants to talk with an Ethernet node, it uses the flipped version of the MAC address, which, when encountered by the 8209, is flipped back and thus delivered correctly.

The 8209 is NOT specially programmed to assist AARP. Thus, the AARP address is stored in the Token Ring AppleTalk node in its "unflipped" form. Then, should it be used later to address a packet, the 8209 will flip the bits when forwarding back to Ethernet. Now, the packet is incorrectly addressed, and cannot be delivered.

The long and short of this is that when using an IBM 8209 to bridge Token Ring and Ethernet, AppleTalk nodes on the ring and Ethernet cannot communicate, because they can never AARP correctly.

Curiously, if the Token Ring is used only as a backbone, and a Macintosh on Ethernet wants to talk to a Macintosh on another Ethernet, with both Ethernets attached by 8209s, this connection will work. In fact, as long as you go through an even number (2,4,6,8...) of 8209 bridges, connection is possible. When there is an odd number, connection will fail. Note that this makes some extremely bizarre network configurations possible, like a system of alternating Token Rings and Ethernets connected by 8209s, where:

- All the Ethernets would have AppleTalk connectivity.
- All the Token Rings would have AppleTalk connectivity.
- The rings and Enets would have AppleTalk connectivity between them.

You may remember that under AppleTalk Phase 2, Apple uses multicast addressing for all protocol "overhead" packets, like RTMPs, NBPs, and ZIPs. You may also recall that Apple has a range of 254 addresses used in Ethernet and 19 (different) addresses in Token Ring available for multicasts.

The fact that we use different ranges of addresses (in addition to the bit flipping described above) ensures that AppleTalk nodes cannot interoperate across an 8209 bridging Ethernet and Token Ring. Just look at the boot process.

A node begins by AARP'ing for a protocol address (multicast). This AARP is forwarded by the 8209, but because the bits are flipped, a response to the AARP probe would be lost on the return trip. So, the node assumes that its protocol address is unique, and then proceeds to check for a router by multicasting (protocol broadcasting) a ZIP GetNetInfo request. If there is an AppleTalk router present on my cable (whether we are on Ethernet or

Token Ring), we are okay. The router hears my request, provides the needed information about the cable, and I re-AARP if necessary.

However, if the router is on the other side of the 8209, the multicast is forwarded. Even if the bit-flipping wasn't a problem (say, if IBM were to change the 8209 software to support AARP), it will still not make connection with the router, because a TokenTalk router expects multicast addresses in a different range than a EtherTalk node can send, and vice versa.

The only answer is to use an AppleTalk router, which manages protocol and zone multicast addresses for each data link appropriately.

In short, AppleTalk and 8209s don't mix. Don't use bridging strategies between AppleTalk Token Ring and Ethernet networks.

There are additional problems with 8209 and AppleTalk described in a separate article "IBM 8209/MacTCP: Support Alert Information."

## Macintosh IICI, IISI, LC, and LC II: Video Pinouts

Revised: 2/3/93  
Security: Everyone

Macintosh IICI, IISI, LC, and LC II: Video Pinouts

=====

Article Created: 19 March 1991

### Article Change History

-----

02/03/93 - CORRECTED

- The IICI and IISI do support the Apple Portrait Display with built-in video.

02/03/93 - UPDATED

- Added information from article titled "Macintosh IISI, IICI, LC: Monitor Compatibility"

09/15/92 - REVISED

- To clarify what monitors the IICI & IISI video port supports.

### TOPIC -----

What are the differences between the Macintosh IICI on-board video pinouts and signals versus the Macintosh IISI, Macintosh LC, and Macintosh LC II? What pin can I "sense" to see a 13-inch RGB monitor connected when there is none connected (that is, testing a projector connected but with no monitor attached)?

### DISCUSSION -----

#### Pinouts

-----

The Macintosh IICI, Macintosh IISI, Macintosh LC, and Macintosh LC II have the same pinouts for their built-in video ports:

| Pin | Function      |
|-----|---------------|
| --- | -----         |
| 1   | Red Video GND |
| 2   | Red Video     |

|       |                       |
|-------|-----------------------|
| 3     | CSynch                |
| 4     | Mon. ID 1             |
| 5     | Green Video           |
| 6     | Green Video GND       |
| 7     | Mon. ID 2             |
| 8     | N.C.                  |
| 9     | Blue Video            |
| 10    | Mon. ID 3             |
| 11    | CSynch and VSynch GND |
| 12    | VSynch                |
| 13    | Blue Video GND        |
| 14    | HSynch GND            |
| 15    | HSynch                |
| Shell | Shield GND            |

Sense Codes

-----

| 12 | ----- | Vsync                                               | ----- | 14 |
| 14 | ----- | Sync Ground                                         | ----- | 10 |
| 10 | ----- |                                                     |       |    |
| 7  | ----- | Connect 7 and 10 so the sense pin ID will equal VGA |       |    |

A few issues to remember when connecting VGA monitors to the Macintosh LC or LC II:

- VGA monitors may have variances when purchased from different VGA monitor vendors. It is suggested that a particular monitor be tested for compatibility with the Macintosh LC or LC II before making a purchase decision.
- VGA monitors from different vendors have different image quality specifications. There may be significant differences between the Apple logo monitors and the VGA monitors. A side-by-side review of the monitors should be done before deciding which monitor to buy.
- When a VGA monitor is connected as described above, the resolution is 640 x 480. The bit-depth supported depends on the amount of VRAM installed. If the Macintosh LC 256K VRAM SIMM is installed, 4-bit color

(16 colors) is supported. With the Macintosh LC 512K VRAM SIMM installed, 8-bit color (256 colors) is supported.

Security: Everyone

AppleTalk Phase 2: Upgrade Utility

=====  
  
Article Created: 15 March 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

What is the AppleTalk Phase 2 Upgrade Utility? What does it do?

DISCUSSION -----

The AppleTalk Phase 2 Upgrade Utility makes it possible for AppleTalk Phase 1 routers to operate concurrently in an Internet with the AppleTalk Internet Router. The AppleTalk Phase 2 Upgrade Utility is an INIT that is installed in the System Folder of the Macintosh running the AppleTalk Internet Router software.

Why the AppleTalk Phase 2 Upgrade Utility Is Necessary

-----  
The AppleTalk Internet Router sends out AppleTalk Phase 2-style Routing Table Maintenance Protocol (RTMP), Name Binding Protocol (NBP), and Zone Information Protocol (ZIP) packets. AppleTalk Phase 1 routers cannot interpret the data within these packets.

With the AppleTalk Phase 2 Upgrade Utility installed, any RTMP, NBP, or ZIP packet about to be sent out over a cable with an AppleTalk Phase 1 router on it, will be sent as an AppleTalk Phase 2-style packet and will be converted by the AppleTalk Phase 2 Upgrade Utility and sent out as an AppleTalk Phase 1-style packet as well.

Note: Only RTMP, NBP, and ZIP packets are converted to AppleTalk Phase 1-style packets. No other packets types need to be converted.

The AppleTalk Phase 2 Upgrade Utility also makes it possible for the AppleTalk Internet Router to receive AppleTalk Phase 1-style RTMP, NBP, and ZIP packets. When the AppleTalk Phase 2 Upgrade Utility INIT is installed,

it throws a switch in the AppleTalk Internet Router that lets the router accept and process AppleTalk Phase-1-style RTMP, NBP, and ZIP packets. The AppleTalk Phase 2 Upgrade Utility does not convert these packets. The AppleTalk Internet Router has code built into it that lets it interpret these packets properly.

What the AppleTalk Phase 2 Upgrade Utility Does Not Do

-----  
It does not convert all outgoing AppleTalk Phase 2 packets to AppleTalk Phase 1 packets. This is not necessary--only RTMP, NBP, and ZIP packets need to be converted.

The AppleTalk Phase 2 Upgrade Utility does not work with any third-party router; it works only with the AppleTalk Internet Router.

## StyleWriter Printer: Specifications (Discontinued)

Revised: 7/23/96  
Security: Everyone

StyleWriter Printer: Specifications (Discontinued)

=====

Article Created: 14 March 1991  
Article Reviewed/Updated: 12 October 1993

TOPIC -----

This article gives specifications for the Apple StyleWriter printer.

DISCUSSION -----

Marking Engine

-----  
Thermal ink jet

RAM

---  
64KB

Resolution

-----  
- 360 dots per inch  
- 180 dots per inch (in Draft mode)

Interface

-----  
Apple serial

Ink Cartridge

-----  
Cartridge capacity: up to 500 pages, user-replaceable

Font Families

-----  
Times, Helvetica, Courier, and Symbol (TrueType fonts) and any new TrueType fonts developed

Type Styles

-----

Regular, bold, italic, and bold italic

Speed

-----

Normal mode: 1/2 page per minute (average)

Draft mode: 1 page per minute (maximum)

Paper Feed

-----

- Detachable cut-sheet feeder accurately feeds up to 50 sheets automatically
- Rear manual-feed slot ideal for printing on materials like envelopes, labels, transparencies, and heavy paper
- Front manual-feed slot provides easy access for standard paper

Recommended Paper

-----

- 20-lb. cotton bond paper (16- to 28-lb. paper acceptable)
- #10 business envelopes
- 3M brand CG3480 transparency film
- Labels

Printable Surface

-----

- Maximum printable line: 8 inches (203.2mm)
- Minimum top and bottom: 0.25 inch (6.35mm)
- Minimum left and right: 0.25 inch (6.35mm)

Weight and Dimensions

-----

- Height: 12.5 inches (32cm)
- Width: 13.25 inches (33.6cm)
- Depth (with output tray closed): 5.6 inches (14.2cm)
- Weight: 7.5 lbs. (3.4kg)

Environment

-----

- Temperature: 59 to 86 degrees F (15 to 30 degrees C)
- Humidity: 20% to 70%

Power Requirements

-----

- U.S./Japan: 100 to 120Vac, 48 to 62Hz
- Europe/Australia: 220 to 240Vac, 46 to 62Hz

Power Adapter specs

-----

- Minimum Voltage 7.5 VDC
- Nominal Voltage 9.5 VDC
- Maximum Voltage 16.0 VDC

The adapter usually reads around the 9.5 volt DC value but they may read

anywhere between 7.5 and 16 volts DC and be fine.

#### Image Utility

-----  
The Image Utility, included with the StyleWriter, lets you convert 300-dpi half-tone images (PICT format) to 360-dpi printable images.

#### System Requirements

- 
- Macintosh personal computer with at least 1MB RAM
  - System software 6.0.7 or later

#### Article Change History:

23 Jul 1996 - Added System requirements.

12 Oct 1993 - Added voltage specs for the power adapter

## Personal LaserWriter LS: Specifications (Discontinued 5/93)

Revised: 9/27/93  
Security: Everyone

Personal LaserWriter LS: Specifications (Discontinued 5/93)

Article Created: 14 March 1991

TOPIC -----

This article gives specifications for the Apple Personal LaserWriter LS printer.

DISCUSSION -----

Marking Engine

-----  
Canon LPBP-LX laserxerographic

RAM

---  
512KB, upgradeable to 1MB

Controller

-----  
Application-Specific Integrated Circuit (ASIC)  
- 512KB of RAM and RS-422 serial interface

Resolution

-----  
300 dots per inch

Interface

-----  
High-speed RS-422 serial interface, externally clocked (909Kb/sec.)

Font Families

-----  
Times, Helvetica, Courier, and Symbol (TrueType fonts) and any new TrueType fonts developed

Type Styles

-----

Regular, bold, italic, and bold italic

Speed

-----

4 pages per minute (maximum)

Recommended Paper

-----

- 20-lb. photocopy paper or typewriter bond (16- to 28-lb. paper acceptable)
- Envelopes (3.5x7 to 7.4x10.5)
- Medium-weight transparency film
- Labels

Paper Sizes

-----

- U.S. letter
- U.S. legal
- A4
- B5

Paper Feed

-----

- Multipurpose tray, manual or automatic: up to 50 sheets or 5 envelopes
- Optional paper cassette: 250 sheets of 20-lb. paper
- Optional legal cassette: 250 sheets of legal-size paper
- Optional envelope cassette: 15 envelopes

For labels, the multipurpose tray and manual feed must be used.

Printable Surface

-----

- Maximum printable line: 8 inches (203.2mm)
- Minimum top and bottom: 0.25 inch (6.35mm)
- Minimum left and right: 0.25 inch (6.35mm)

Actual printable area may vary depending on the application.

Weight and Dimensions

-----

- Height: 8 inches (20.3cm)
- Width: 15 inches (38cm)
- Depth: 18.3 inches (46.4cm)
- Weight: 31 lbs. (14.5kg)

Environment

-----

- Temperature: 50 to 90 degrees F (10 to 32 degrees C)
- Humidity: 20% to 80%

Power Requirements

-----

- U.S./Japan: 100 to 115Vac, 50 to 60Hz
- Europe/Australia: 220 to 240Vac, 50 to 60Hz

## Apple Access II 1.3.1: Description and Compat (Discontinued)

Revised: 6/24/94  
Security: Everyone

Apple Access II 1.3.1: Description and Compat (Discontinued)

Article Created: 6 February 1991

TOPIC -----

I need a product description for Access II v1.3.1, which differs from version 1.2.

DISCUSSION -----

Here are the specs for Apple Access II, Version 1.3.1 (A2D2013).

Description  
-----

Apple Access II turns an Apple IIc, IIc Plus, IIe, or Apple IIGS personal computer into an intelligent terminal that can communicate with a variety of computers and on-line information services.

You can use Apple Access II with any modem that operates through an RS-232 port or by direct connection to another computer with an asynchronous port.

Features  
-----

The software supports transmission speeds of up to 9600 baud. Other features of Apple Access II include:

- All features of the Apple Modems including automatic dialing
- Automatic login to remote computers
- Emulation of TTY, ANSI VT100(TM), and VT-52(TM) terminals
- Support for special keyboard features of VT100 and VT-52 terminals including the four PF (programmable function) keys
- The ability to upload and download ASCII files to and from other computers

- Support for 40- and 80-column video displays
- Processing of downloaded data from remote systems and working with it off-line, significantly reducing timesharing costs
- Sending or receiving any type of ProDOS file
- Support for XMODEM and Binary II file transfer protocols
- The AppleWorks user interface
- Automatic communications and full disk support, including file transfer
- A command-file, programming language for development of logon scripts
- Preconfigured scripts for the following online information services:
  - Dow Jones
  - CompuServe
  - The Source
  - Delphi
  - Genie
  - Dialog Information Services
- For the IIGS, the ability to capture text directly to the printer and 64K serial buffer

#### Requirements

-----

To use Apple Access II, you need the following components:

- An Apple IIc, IIc Plus, IIe, or IIGS personal computer with at least 64K of RAM (128K recommended)
- For the Apple IIe, an Apple Super Serial Card in Slot 2
- An Apple Modem or another modem with RS-232 interface
- An RS-232 cable
- A compatible video display device
- An external disk drive or hard disk (optional)
- An 80-column card for the IIe (optional)
- A compatible printer (optional).

#### Apple Access II Kit

-----

The Apple Access II kit includes:

- Access II program disks in both 5.25-inch and 3.5-inch formats
- An interactive tutorial disk
- A user's guide.

#### Incompatibilities

-----

Apple Access II does NOT work with the following equipment:

- Apple II or II Plus
- Apple III in Apple II emulation mode
- A modem for the Apple IIe that has its own interface card.

Note: Apple Access II does NOT support split-speed transmissions (sending at one rate and receiving at another).

## A/UX 2.0: Header File Problem/Fix

Revised: 11/10/92  
Security: Everyone

A/UX 2.0: "Header File" Problem/Fix

=====

Article Created: 6 February 1991

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I've encountered a compilation problem recently while porting a program (tcsh, from OSU) to the A/UX 2.0 environment. The problem seems to be that some of the system's header files aren't compiling properly. The sample code below demonstrates the problem I've experienced:

-----

```
/* test file, called tsts.c */

/* these are well-knowns that should work */
#include <sys/errno.h>
#include <stdio.h>

/* these don't work */
#include <sys/stat.h>
#include <sys/times.h>

main()
{

}
```

Now, take a look at what I did. On the first try, I used the command:

```
cc tsts.c
```

Here is the output:

```
"/usr/include/sys/stat.h", line 48: syntax error
"/usr/include/sys/stat.h", line 48: cannot recover from earlier errors:
goodbye!
```

On the second try, I used the command:

```
gcc tst.c
```

Here is the output:

```
In file included from tst.c:7:
/usr/include/sys/stat.h:48: parse error before `dev_t'
/usr/include/sys/stat.h:54: parse error before `dev_t'
/usr/include/sys/stat.h:64: parse error before `time_t'
In file included from tst.c:8:
/usr/include/sys/times.h:29: parse error before `time_t'
```

Is there something amiss? I'm assuming the header files stat.h and times.h are identical to the header files available to you, so I've not copied them here.

DISCUSSION -----

Put the following line before the #include <sys/stat.h> line. It should work, because some of the declarations in <sys/stat.h> were defined in <sys/types.h>.

```
#include <sys/types.h>
```

## Draw PIC Graphics: Translating to Macintosh PICT

Revised: 3/25/91  
Security: Everyone

Draw PIC Graphics: Translating to Macintosh PICT

Article Created: 6 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How can I translate graphical Draw PIC formats from PCs to Macintosh PICT format?

DISCUSSION -----

We do not know of a file-conversion utility that translates Draw PIC formats to Macintosh PICT.

"PICTure This" can translate Lotus PIC formats to Macintosh PICT2 format. It can also translate the following formats to Macintosh PICT2:

|       |      |              |         |            |
|-------|------|--------------|---------|------------|
| Targa | TIFF | Sun Raster   | Gem IMG | PixelPaint |
| CGM   | RIFF | X11 Bitmap   | GIF     | Lotus PIC  |
| PCX   | IFF  | Dr. Halo CUT | RLE     | Lotus BIT  |

A possible solution would be to check if the application that produces the Draw PIC format can save the documents to any of the above formats, and then use "PICTure This" to translate it to the Macintosh. Alternatively, any other PC application that can read Draw PIC formats and can write out the document in one of the above formats will work.

The company that wrote the application that produces Draw PIC formats may also be able to provide some information above what the Draw PIC format is, and how to translate it to some other format.

## Macintosh Portable: Dialing an Internal Modem

Revised: 3/25/91  
Security: Everyone

Macintosh Portable: Dialing an Internal Modem

=====

Article Created: 6 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am having problems using the Communications Toolbox, the Apple Modem Tool, and MacTerminal 3.0 on a Macintosh Portable. I am unable to establish connection to the Macintosh Portable's internal modem when I select "Open Connection" from the menu. However, when I leave the phone number field blank in the Apple Modem Tool's connection dialog box, I have no problems establishing a connection with the internal modem.

DISCUSSION -----

We suspect that your problem is caused by an improper setting in the connection dialog box of the Apple Modem Tool. Be sure you've selected the Macintosh Portable Data Modem 2400 in the "Modem:" popup menu at the bottom of the "Connection Settings" dialog box. When we chose a different modem type under this popup menu, we duplicated the problem you describe.

## BAD 1.1 INIT Is Shareware

Revised: 3/25/91  
Security: Everyone

BAD 1.1 INIT Is Shareware

=====

This article last reviewed: 6 February 1991

TOPIC -----

Logging onto AppleLink (with "reseller privileges") I notice the INIT BAD 1.1 is located under the User Groups icon (path: Product Questions and Answers/ Macintosh/ System Software). I have done a fairly detailed analysis of this INIT and I believe it could be useful to some of my customers.

Can I freely distribute this INIT to my resellers? Can my resellers freely distribute this to their end-users? I assume the answer is "Yes." Otherwise, I would not expect it under the User Group icon.

DISCUSSION -----

BAD 1.1 is not an Apple product. Rather, it is a shareware program by Giuseppe Carnevale from Italy. As such, it can be freely copied and distributed, but should not be distributed as an Apple-supported program. If you do distribute it, it must be made clear that the author expects payment for each station where it is actively used.

More information can be obtained from the program's documentation, or by opening the program's "About" window. This is done as follows:

- 1) With BAD active, select an already-formatted disk.
- 2) Select Erase Disk from the Finder's Special menu. Instead of the normal initialization dialog, you should be presented with BAD's own "The disk '<name>' is already initialized." dialog.
- 3) Click the BAD disk icon at the left of the dialog window and the author's address will appear.

## Macintosh: Printing to DEC ScriptPrinter LN03R

Revised: 3/27/91  
Security: Everyone

Macintosh: Printing to DEC ScriptPrinter LN03R

=====

This article last reviewed: 6 February 1991

TOPIC -----

Do you know of a way to print from a Macintosh to a LN03R? I have a driver that supports modem communication, but I need something that supports a direct serial connection.

DISCUSSION -----

To our knowledge, there is no driver that lets a Macintosh print directly to the Digital ScriptPrinter LN03R. One alternative is to print to a disk file from the application and then send the file to the printer using a terminal emulation program. With the correct cable, you can communicate to the printer using a terminal emulation program like MacTerminal over the serial port. Needless to say, this is not very convenient.

Another alternative is to use the printer on the network:

- DEC LanWORKS for Macintosh offers this capability. The service is called VAXshare Print Server, and it supports Digital's LPS20, LPS40, ScriptPrinter LN03R, and Apple's LaserWriter, LaserWriter Plus, LaserWriter IINT, and LaserWriter IINTX.
- With Alisa Digital Printer Support System (ADP), an option for AlisaTalk for VAX/VMS, Macintosh users can print to Digital PostScript devices like the LN03R ScriptPrinter and the PrintServer 40. The Digital PostScript device looks like an Apple LaserWriter to the Macintosh user.

ADP makes use of VMS system queuing and printing. Features include forms and paper type control, optional job flag and trailer pages for job identification, paper tray selection, and support for the Adobe system typeface pack. Once VMS receiver process handles all Macintosh users, a new process for each job is not necessary. The software uses

standard Digital Print symbionts and automatically loads the Laser Prep dictionary at the front of each Macintosh job that is submitted.

- PacerPrint from Pacer Software, Inc., offers similar features. For more information on Alisa Digital Printer support system or PacerPrint, search the Technical Info Library using keyword "Alisa" or "PACER."

## Novell Token Ring Network: Access from Macintosh

Revised: 3/26/91  
Security: Everyone

Novell Token Ring Network: Access from Macintosh

=====

Article Created: 6 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can I access Novell Token Ring network and its server using the existing Apple Token Ring card and also Netware for Macintosh?

DISCUSSION -----

The Novell TokenTalk support is orderable and was delivered in September 1990. This is a new version of VAP (Value-Added Process) that supports AFP (Apple Filing Protocol) 2.0 and TokenTalk.

All Netware operating systems provide an internal router that lets a Netware server connect to four different networks. No additional software is required. Note that the routing service can also be moved out of the server and into a non-dedicated workstation.

Macintosh, DOS, and OS/2 workstations can share data and resources. Macintosh users should see information stored on the network server as icons. Other workstations on the network (PCs running DOS, OS/2, or Windows/386) should see the folders and file icons from the Macintosh listed as directories and subdirectories in their workstation formats.

DOS, OS/2, and Macintosh users can share Apple LaserWriters and other Apple printers. Using an E-mail package that supports Netware Message Handling Service (MHS), the back-end store-and-forward messaging server, you can send E-mail messages, text, data, and binary files between different LANs and between wide-area networks.

For contact information, search the Technical Info library under "Novell" and the Enhancement Products Division of the Netware Products Division.

## EtherTalk NB and EtherLink NB: Revision Numbers

Revised: 3/26/91  
Security: Everyone

EtherTalk NB and EtherLink NB: Revision Numbers

=====

Article Created: 6 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I understand that AppleTalk Phase 2 and the Macintosh IIci require Rev. J or Rev. K of the EtherTalk NB Card, while the Macintosh IIfx requires the EtherTalk NB Card Rev. L (Rev. L is not merely an upgrade to a Rev. J or Rev. K). If this is the case, why are brand new 3Com EtherLink NB Cards (with 1990 labels on their diskettes) Rev. B?

DISCUSSION -----

3Com uses a different assembly numbering scheme for the Ethernet cards that they sell under their own label, as the 3Com EtherLink NB Card, than it does for the Ethernet cards Apple buys from 3Com and sells under its own (Apple) label as the Apple EtherTalk NB Card. The chart below shows how the 3Com EtherLink NB Cards relate to the Apple EtherTalk NB Cards:

| Apple EtherTalk NB Card<br>Assembly Number | 3Com EtherLink NB Card<br>Assembly Number |
|--------------------------------------------|-------------------------------------------|
| 2680-06 Rev. J                             | 4042-02 Rev. 09                           |
| 2680-07 Rev. K                             | 4042-03 Rev. 0A                           |
| 2680-08 Rev. L                             | 4042-04 Rev. 0A                           |
| 2680-08 Rev. M                             | 4042-04 Rev. 0B                           |

Note: The Rev. M EtherTalk NB Card has no functional modifications or differences from the Rev. L EtherTalk NB Card. The revision from "L" to "M" was made because of a process change in manufacturing and not because of any enhancements to the card. Here is a compatibility list of Macintosh systems and Apple EtherTalk NB Cards:

|                     |                |                            |
|---------------------|----------------|----------------------------|
| Macintosh II or IIX | Macintosh IICx | Macintosh IIfx, IIsi, IIci |
|---------------------|----------------|----------------------------|

## LaserWriter IINTX and Hard Disk Space Available

Revised: 3/26/91  
Security: Everyone

LaserWriter IINTX and Hard Disk "Space Available"

=====

Article Created: 6 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a question concerning hard-drive formatting when an Apple hard drive is attached to a LaserWriter IINTX.

It seems that you never get the same "space available" amount when formatting two same-sized hard drives. This is true even if you reformat the same hard drive more than once. The second time you format the drive, you may get more, or even less, space available. The third time you format it, you may get an entirely different number, sometimes more, sometimes less.

DISCUSSION -----

We tried to duplicate the problem you described on a LaserWriter IINTX with the old 1.0 ROMs and a LaserWriter IINTX with the new 3.0 ROMs. For the LaserWriter with the 1.0 ROMs, we used the "LaserWriter Font Utility 1.0" program. For the LaserWriter with the 3.0 ROMs we used the "LaserWriter Font Utility 2.0" program.

In both cases, the LaserWriter IINTX printers reported that the hard disk had the same amount of total space and the same amount of space available. Could it be that the hard disk may have some problem with it? Try a different hard disk. Also, try a different LaserWriter.

We wrote the following PostScript program that returns information on the total space and the total free space of the hard disk connected to a LaserWriter IINTX:

```
serverdict begin 0 exitserver
/Times-Roman findfont
15 scalefont
```

```
setfont
72 700 moveto
/str 20 string def
/str1 20 string def
(Hard Disk Usage; total space in K: ) show
statusdict begin diskstatus str cvs show
72 670 moveto
(Hard Disk Usage; total free space in K: ) show
str1 cvs show
showpage
```

## Macintosh IIsi, Macintosh LC: Power Limits & Thermal Shutdown

Revised: 7/16/92  
Security: Everyone

Macintosh IIsi, Macintosh LC: Power Limits & Thermal Shutdown

=====

Article Created: 11 February 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 5 August 1991

TOPIC -----

What can you tell me about the Macintosh LC and the Macintosh IIsi concerning their power supplies and power ratings for their slots? At what temperature will the thermal shutdown circuits shut down the power supply?

DISCUSSION -----

The power limit for the NuBus slot in the Macintosh IIsi is 15 watts (the same for any Macintosh II NuBus slot). The power limit for the Direct slot in the Macintosh LC is 4 watts.

Both the Macintosh LC and the Macintosh IIsi have a thermal shutdown circuit which will shut down the power supply in the event of possible overheating from excess power draw. The maximum operating temperature is approximately 105 degrees Fahrenheit.

The Macintosh LC will cycle off-and-on until the temperature reaches a safe operating level (It will make a motorboating sound). At that point, it will resume operation.

In the event of overheating, the Macintosh IIsi acts as if you had chosen Shut Down and will let you power up it up again only when the temperature drops to a safe level. Pressing the keyboard Power On key has no effect in this condition. If the Macintosh IIsi power switch is locked on, it will behave like the Macintosh LC.

If A/UX 2.0 is purely used for NFS purposes only, it might be possible to squeeze the size and fit it on a 40MB disk. However, it might take some time to go through each of the files and/or directories and determine which to keep or to remove.

In general, a lot of files and/or directories like /usr/catman, /usr/games, /usr/dict, /mac/src, may be removed.

The default Swap size in A/UX 2.0 is about 18MB. 14MB was the default swap size used in A/UX 1.1.1 and before. This increase is mainly for A/UX 2.0 MultiFinder activities. If you do not have many Macintosh applications and/or specifically A/UX applications like C language compilations running on the system, it may be reduced to below 10MB. Furthermore, if you have plenty of physical RAM, 16MB or 32MB for example, you may reduce more swap space.

Again, this is still the "It depends..." type of question. We can't give an exact number on the size of Swap area and also, which files/directories should be kept or removed. You probably need to play the "try and error" game to knock the system below 40MB.

PacerLink Support for PC over Token Ring

=====

Article Created: 11 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there any way to access PacerLink terminal services on a VAX from a PC connected on a Token Ring Network? I am running:

|                |      |
|----------------|------|
| PacerLink PC   | 5.3  |
| PacerShare VMS | 5.5  |
| DOS Version    | 3.31 |

DISCUSSION -----

PacerLink does not support terminal services to a VAX over Token Ring. Pacer Software told us that they are considering this option some time in the far future; you won't see the implementation in the next release.

Macintosh IIsi: EtherPort Compatibility Issues

=====

Article Created: 11 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are there any known compatibility problems with the Kinetics/Excelan/Novell EtherPort II cards and the Macintosh IIsi?

Has this card has been tested, and, if so, could you provide the hardware and software versions, and the results of your test? If not, have any other issues surfaced?

DISCUSSION -----

This is what we learned from Novell: Any software incompatibilities would reveal problems between the driver and the operating system. The card itself would not be the cause of a software conflict.

If the driver installer disk has an old System folder, boot from the System Tools disk, then put in the EtherPort Installer disk and run the Installer as you would normally. You'll have to do some disk swapping, but it should work. Past the OS question, there should be no other software problems.

Because the Macintosh IIsi is rather new, we have not been able to verify that there are NO incompatibilities. When Shiva Corporation bought the EtherPort line of Macintosh-to-Ethernet interface boards from Novell, Inc. (in December 1990), they made a commitment to support the EtherPort and driver with all of the appropriate Macintosh computers. So, in the future, they might be able to provide more detailed information on the compatibility issues concerning the newer Macintoshes.

My guess is that Shiva is making a very safe statement saying that because the EtherPort II has not been thoroughly tested with the Macintosh IIsi or the Macintosh LC, they cannot (and neither can we) say the card will work

with those computers. So, at this point customers just have to try the combination to see if it works. Probably they are also saying that if some problem is found, they will release new hardware and/or software to provide solutions.

MacTCP: RFC Conformance

=====

Article Created: 11 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'd like to know what RFCs and MIL-STDs MacTCP follows.

DISCUSSION -----

MacTCP is a complete implementation of the TCP/IP protocol suite and is fully compliant with the appropriate MIL-STDs (1777 and 1778) and RFCs (768, 791, 792, 793, 826, 894, 950, 1034, and 1035) and comprises TCP, UDP, IP, ICMP, DNR and for broadcast networks, ARP. The product will operate with gateways that comply with RFC 1009.

## Internet Router: How to Save Zone Name Changes

Revised: 3/26/91  
Security: Everyone

Internet Router: How to Save Zone Name Changes

=====

Article Created: 11 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I tried to change the name of one our LocalTalk segments. After the change was made, I saved the changes in the Internet router. Then, I re-loaded the router, but the router would not accept the change of name. It kept on referring to the old name of the zone. There were no other routers loaded at the time. The router let me change all the other zone names including EtherTalk and TokenTalk zones. This is a total Phase 2 network.

DISCUSSION -----

There is no reason for the router to exhibit the symptoms you described. When you change a non-extended networks zone name you must follow these steps:

- 1) Set the current status to off.
- 2) Click the Zone name box for the network you want to change.
- 3) Select the zone name from the zone names list, there should be only one for non-extended networks.
- 4) Click the Delete button to remove the zone name from the list.
- 5) Type the new zone name into text box and click on the Add button.
- 6) Save the changes and restart the Macintosh.

It's easy to open the dialog box to change the zone name. Select the old name, change it in the text box and click Done without ever deleting the old zone name from the list. This causes the zone name for the network to

not be updated, and the old zone name would be used the next time the router is loaded.

The only way this could fail is if there is another router that still has the old zone name or a different zone name configured for this network. The newly-configured router would then fail with a conflicting zone name message the next time it loads. It would not fall back to the old zone name, but would fail and ask you to reconfigure and restart.

## HyperCard 2.0: Print Report Procedure

Revised: 3/26/91  
Security: Everyone

HyperCard 2.0: Print Report Procedure

=====

Article Created: 14 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have switched over to HyperCard 2.0. In earlier versions, I used the "column format" in which you could drag the dashed separation lines to print out a report. How do I do this in HyperCard 2.0?

DISCUSSION -----

The Print Report functions of HyperCard 2.0 has many more features than previous version. Unfortunately, laying out a report the first time requires more work than before. One of the main differences that may be confusing you is that you must specify the items to print by using menu items that come up when you select Print Report. These items are no longer in the Print Report's dialog box as in previous versions.

Creating a report template is described in the "HyperCard Reference" manual in the Chapter on Printing (presently chapter 7, page 380).

In brief:

- 1) Choose Print Report.
- 2) Choose New Report from the Reports menu; name your report.
- 3) In the Print Report dialog box, set up the layout for your report. Resize cells, add a header if desired, and set your options.
- 4) Choose Report Items from the Edit menu.
- 5) Choose new Item from the Item menu; while the item is selected, resize and reposition if desired.

- 6) While the item is selected (step 5), choose Item Info from the Items menu (or double-click it).
- 7) Specify the contents of the item, and its characteristics like font and size, alignment, and so on.
- 8) Click OK.
- 9) Repeat steps 5 through 8 if desired.
- 10) When you've added all of the items you want, click OK to return to the Print Report dialog box.
- 11) Click Print.

Many more options are available than what is covered here. However, this should be a reasonable primer on the Print Report function. HyperCard 2.0 lets you create and save up to 16 reports per stack, and is much more capable and versatile than earlier versions.

## Macintosh LC: RAM Configurations and Limits

Revised: 7/23/92  
Security: Everyone

Macintosh LC: RAM Configurations and Limits

Article Created: 14 February 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated: 8 October 1991

### TOPIC -----

What is the maximum amount of memory possible in the Macintosh LC? Is 10MB an absolute limit? Will a future Macintosh LC be able to use 34MB with the addition of two 16MB SIMMs?

### DISCUSSION -----

There is a limit of 10MB of RAM on the Macintosh LC when running under System 7. It will not be possible to use 16M SIMMs to achieve 34MB. This is because the memory map for the Macintosh LC reserves only 10MB of address space for RAM, regardless of if it is in 24-bit mode or 32-bit mode. The memory map is as follows:

| Function<br>----- | 24-bit mode<br>----- | 32-bit mode<br>-----    |
|-------------------|----------------------|-------------------------|
| RAM               | \$00 0000-\$9F FFFF  | \$0000 0000-\$009F FFFF |
| ROM               | \$A0 0000-\$DF FFFF  | \$40A0 0000-\$40DF FFFF |
| Expansion space   | \$E0 0000-\$EF FFFF  | \$FE00 0000-\$FEFF FFFF |
| I/O space         | \$F0 0000-\$FF FFFF  | \$50F0 0000-\$50FF FFFF |
| VRAM              | \$FC 0000-\$FF FFFF  | \$50FC 0000-\$50FF FFFF |

It is also not possible to use 256K or 512K SIMMs. The possible RAM configurations, using 1MB, 2MB, and 4MB SIMMs, for the Macintosh LC are:

- 2MB -- soldered on the motherboard
- 4MB -- add two 1Mbit SIMMs in each of the SIMM connectors
- 6MB -- add two 2Mbit SIMMs in each of the SIMM connectors
- 10MB -- add two 4Mbit SIMMs in each of the SIMM connectors

The Macintosh LC requires 100ns or faster SIMMs.

Apple Scanner: 8-Pin Port Is Non-Functional

=====

Article Created: 14 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I need information regarding the 8-Pin port that is next to SCSI port on the Apple Scanner. What is it for? (The icon indicates LocalTalk.) How can developers find out more about implementing it?

DISCUSSION -----

The port was originally intended to allow the scanner to be connected to the network. This capability was eventually dropped, so the port is essentially connected to nothing. There is no way for developers to use the port.

## 3270 Async Terminal Emulation and File Transfer Needed

Revised: 7/27/93  
Security: Everyone

3270 Async Terminal Emulation and File Transfer Needed

Article Created: 14 February 1991  
Article Reviewed/Updated: 26 July 1993

TOPIC -----

I am looking for a package to duplicate the capabilities of IBM's FT Term. It runs on PCs and includes 3270 terminal emulation running over async lines with support for 5 DFT sessions and file transfer on a single call. Does any package for the Macintosh duplicate this functionality?

DISCUSSION -----

The PC/HOST File Transfer and Terminal Emulator Program (FTTERM) provides 3270, DEC VT100, DEC VT220 and 3101 terminal emulators, along with 3270 and ASCII file transfer capabilities. In addition, FTTERM Version 2.1 expands its connectivity options to let an IBM Personal Computer or Personal System/2 operate on an IBM Token-Ring Network or a Broadband IBM PC Network local area network (LAN).

When operating on the LAN, it uses the Enhanced Bios Interface Programs and communicates through the IBM Local Area Network Asynchronous Connection Server Program (LANACS), to connect to ASCII Hosts, dial Information Providers, and obtain the use of Protocol Converters to allow access to IBM hosts. File transfer is supported to ASCII hosts or IBM Hosts. FTTERM Version 2.1 also supports an asynchronous connection for IBM Professional Office System (PROFS) (TM) Applications Support Feature (PASF) Version 2.2.2 (non-Token-Ring LAN configurations) and GDDM-PCLK 1.1 through the FTHLLAPI (FTTERM High Level Language Application Program Interface) facility.

The actual session management is controlled at the 3174 and not by FTTERM.DFT emulators like Personal Communications/3270 control sessions within the PC. In previous microcode levels, an ASCII display connected to the Async Emulation Adapter (AEA) was able to have only two sessions, although Coax-type CUT terminals were allowed up to 5 sessions. Microcode level B2 has extended that support to ASCII displays and the AEA.

We have not found a similar application with these functions on the Macintosh. Simware offers a multi-session 3270 terminal emulators and file transfer over asynchronous lines, if used in conjunction with their host software Sim3278 VM or VTAM. RELAY provides only file transfer over async lines to a mainframe running RELAY Communications' RELAY/VM or RELAY/TSO. MacBLAST software for IBM mainframe also transfers text or binary files via async ports or protocol converters. DCA (formerly Avatar) MacMainFrame DX provides only single-session terminal emulation and file transfer over asynchronous lines.

To locate a vendor's address and phone numbers, use vendor name as a search string.

Apple II SCSI Card: ROM Upgrade (2/97)

Article Created: 14 February 1991  
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article describes how to obtain the Apple II SCSI Card ROM upgrade.

DISCUSSION -----

There is a repair extension that covers your on this. Contact your dealer about getting the cards upgraded. Here is the information the dealer will need:

SCSI INTERFACE CARD IIE & IIGS ROM UPGRADE--OLC123  
(Announced March 88)

Users who upgrade to Apple IIGS Operating System Version 4.0 or greater must use the latest revisions of both the SCSI Interface Card and the ProFile Interface Card. You can determine the latest version of these interface cards by checking the part number of their ROM. As of March 88, ROM part number 341-0437, Revision A, is the latest version of the SCSI Interface Card. All SCSI and ProFile Interface Cards now shipped by Apple are the latest revisions.

Apple has revised the ROM on the Apple II SCSI Interface Card to make the card compatible with the Apple-CD SC and the Apple IIGS Operating System. When other products requiring the new ROM are introduced, you will be notified by a Service mailing. The ROM on the card can be identified by the new part number, 341-0437. All Service Stock and Finished Goods inventory has been upgraded to the new ROM.

## Some Macintosh Applications Ignore Inserted Diskettes

Revised: 3/26/91  
Security: Everyone

Some Macintosh Applications Ignore Inserted Diskettes

=====

Article Created: 14 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

With Persuasion or PowerPoint (or both of them) open, when I insert a new unformatted diskette, there is no dialog box asking to initialize the diskette. Even after I quit from the application(s), the system does not acknowledge that a diskette has been inserted. One has to eject the diskette and re-insert it before the initialize dialog box pops up.

This anomaly occurs even under System Software 6.0.7. It does not help to clear the System of INITs or to work under Finder instead of MultiFinder. What could be the reason for it?

DISCUSSION -----

This is not really an anomaly. We will try to explain why:

When a disk is inserted into a disk drive, a disk-inserted event is generated by the Event Manager. It is the responsibility of the application (the active application if MultiFinder is running) to respond to this event. Applications don't have to respond to all possible events. Some applications, like Persuasion and PowerPoint, completely ignore disk-inserted events.

The exception to this is when the SFPutFile or SFGetFile dialog is active for saving or retrieving files. Disk-inserted events are automatically handled when these dialogs are active. The only time this is a problem is when the disk inserted is a disk that must be formatted to be recognized by the system.

All it would take to support disk-inserted events (for initializing) in

most applications is code, in the application's event loop, that looked something like this:

```
diskEvt:
  IF HiWrd(myEvent.message) <> noErr THEN
    BEGIN
      SetPt(aPoint, $70, $50);
      theError := DIBadMount(aPoint, myEvent.message);
    END;
```

## A/UX 2.0: Eschatology and dp (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX 2.0: Eschatology and dp (8/94)

=====

Article Created: 14 February 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

Here is my configuration:

- A/UX 2.0
- Macintosh IIfx
- 80MB hard drive
- Macintosh OS 6.0.5

Doing an installation on a SuperMac drive with

XP100  
XP150  
A/UX 2.0

sets up the partition sizes using the 4.1 manager for SuperMac (the size for each partition is stated in the manual). I do the initial installation which is the stand-alone shell, A/UX Startup.

While in the shell, I run the UNIX DP software. I use DP to designate the partitions as Root, User, Swap, and Eschatology. I quit DP and then follow the manual for installation. When the program gets to the Eschatology partition, I get a message that it will skip the Eschatology partition, because it cannot be found.

Doesn't the DP program assign the proper slice number for the Eschatology partition?

DISCUSSION -----

The following are the standard A/UX file-system, partition names and slice numbers assigned when installing A/UX 2.0:

"A/UX Root"      slice 0

```
"Swap"           slice 1
"Eschatology 1"
"Unreserved 1"   slice 3
```

There is no fixed slice number assigned to "Eschatology 1", but it was pnamed when copying essential files into that partition during installation process. "Usr" will be assigned with slice 2, if it was customized as a separate partition from the A/UX Root partition.

The problem is most likely the use of the name and the type of the "Eschatology" partition when you use "dp" to customize the third-party hard drive. The following is the printout for "Eschatology 1" partition from "dp". Pay attention to the name ("Eschatology 1") and type ("EFS").

```
DPM Index: 6
Name: "Eschatology 1", Type: "Apple_UNIX_SVR2"
Physical: 6144 @ 146126, Logical: 6144 @ 0
Status:

Graphtec MP3100: Connection to Macintosh

=====

Article Created: 14 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am trying to connect a Graphtec MP3100 plotter to a Macintosh, but I don't have the right cable. Do you know what this cable should look like (from the 8-pin serial port on the Macintosh to the DB-25 port on the plotter)?

DISCUSSION -----

The Graphtec plotter can be connected to a Macintosh 8-pin serial port using M0199; the Macintosh-to-ImageWriter cable (pn 590-0553).

Security: Everyone

Macintosh LC: VRAM Upgrade Procedure

=====

Article Created: 26 March 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

TOPIC -----

How do you complete the VRAM Upgrade Installation for the Macintosh LC?  
The documentation in the Upgrade Kit says that the technician should consult the Macintosh Technical Procedures for information on how to complete the upgrade installation, yet there isn't anything in the Tech Procedures to cover this installation.

DISCUSSION -----

Before you begin, familiarize yourself with the Take Apart section of Technical Procedures--especially those sections pertaining to safety and Electrostatic Discharge prevention.

When upgrading the Video RAM (VRAM) of the Macintosh LC, it is important to refer to the note on page 1.2 of the Technical Procedures for the Macintosh Family (Volume Two, Macintosh LC tab), which states that the 512K VRAM SIMM replaces rather than augments the 256K VRAM SIMM on the logic board.

For identification of which SIMM is the VRAM SIMM, you are encouraged to refer to the illustration in the same binder on page 1.4 or the illustrated parts list on page IPL.2, item number 21. The VRAM SIMM is located on the logic board immediately next to the system RAM SIMM connectors. The VRAM differs from system RAM by using a physically larger SIMM connector and more and denser signal leads.

The RAM exchange would be identical to the Macintosh Display Card Upgrade procedure (refer to page 2.10 of the Macintosh Family Cards tab in the Macintosh Family Technical Procedures, Volume Four), except that only one VRAM SIMM is required.

## StyleWriter: Using it with the Macintosh Portable

Revised: 7/28/92  
Security: Everyone

StyleWriter: Using it with the Macintosh Portable

=====

Article Created: 3 April 1991  
Article Last Reviewed: 28 July 1992  
Article Last Updated:

TOPIC -----

The Apple StyleWriter and the Macintosh Portable appear to have similar power adapters. Can they be interchanged?

DISCUSSION -----

Extreme care should be taken when using a StyleWriter with the Macintosh Portable.

The Apple StyleWriter and the Macintosh Portable have physically identical power adaptor connectors. However, they are NOT electrically identical. If you connect a StyleWriter power adaptor (while unplugged from a wall outlet) to the Macintosh Portable, the 3.15 amp fuse inside the StyleWriter power adaptor blows.

The problem is that the Portable power adaptor is center positive, 7.5V, and the StyleWriter unit is center negative, 9.5V.

## Apple Computer, Inc. Trademark List 1 of 2 (10/96)

Revised: 10/17/96  
Security: Everyone

Apple Computer, Inc. Trademark List 1 of 2 (10/96)

=====

Apple Computer, Inc. Trademark List Part 1    October 1996

The following is a current list of Apple's trademarks and service marks, as well as trademarks licensed by Apple from third parties.

When using the marks in publications that will be distributed only in the United States, include the appropriate (TM), SM, or (R) symbol on first use. For publications that will be distributed outside the United States, do not include trademark symbols.

The list also includes one or more suggested generic terms for each trademark. For all publications, include an appropriate generic term with the trademark the first time it appears. Thereafter, the generic term should appear frequently with the trademark. (Note: These generic terms are only suggestions, and there may be other words that are equally appropriate.)

Remember that trademarks are adjectives, and cannot be made plural or possessive.

All publications must include a copyright statement and credit lines listing the Apple and licensed third-party trademarks mentioned in the publication. The document "Using Apple Trademarks/Employee" (see below) explains how to compose the copyright statement and credit lines.

For more information on how to use Apple's trademarks, please refer to the Trademark and Copyright Information area on AppleWeb (<http://web.apple.com/Areas/TrademarkInformation>). Download the documents "Trademark Copy Review Instructions" and "Using Apple Trademarks/Employee." The current Apple Trademark List is also posted there. If you don't have access to AppleWeb, contact the Trademark Department at (408) 974-6638.

The absence of a product or service name or logo from this list does not constitute a waiver of Apple's trademark or other intellectual property rights concerning that name or logo.

Japanese Macintosh Products: Support in the U.S.

=====

Article Created: 24 April 1991

### Article Change History

-----

09/22/92 - REVISED

- To include reseller referral phone number.

09/22/92 - UPDATED

- To include information on the Kanji TrueType product.

### TOPIC -----

On April 23, 1991, Apple USA announced a program to sell and support Japanese-language Macintosh System Software in the United States. This is an extension of a program currently being piloted in Hawaii. To find a reseller for this product, call 1-800-882-8856.

### DISCUSSION -----

These Japanese products will be available only through a limited number of Apple-authorized dealers and VARS (Value Added Resellers). These resellers are required to have a Japanese-speaking System Engineer who has attended a special class for Japanese product support and who provides support before and after the sale. Inquires concerning these Japanese products should be directed only to these authorized dealerships.

The following products are being offered:

- The KanjiTalk Upgrade kit, which includes
  - the KanjiTalk operating system version 6.0.7, and
  - HyperCard-J version 2.0J ("lite" HyperCard localized in Japanese).
- Kanji TrueType - A Japanese font extension that allows high quality, low cost printing solution. It includes two complete fonts.

- HyperCard 2.0J, which includes Japanese manuals.
- The extended Kana character-based keyboard.

Price pages for these products will be available only to specially authorized resellers.

#### Service

-----

Only Kanji-authorized resellers will be allowed to service Apple's Japanese systems.

#### Support

-----

A special support program will handle the Japanese products. Customers will be supported by specially trained bilingual dealer System Engineers. These dealer SEs will escalate their questions to a third party vendor, in essence filling in the role of the Apple field Systems Engineer.

TOPIC -----

Could you please give me an overview of Japanese system software that is now available in the United States?

DISCUSSION -----

The text resources and special features of Japanese Macintosh system software have been translated to fit the Japanese dates, sorting system, and so on. Otherwise, the Japanese system software works like Roman-alphabet system software, and troubleshooting is very similar.

On the other hand, Japanese system software must deal with a total of over 6800 characters in four different character sets. An INIT called KanjiTalk manages this large set; it takes keystrokes and converts them into Japanese. Along with this INIT, a variety of input modules, dictionaries, and fonts files are necessary to support KanjiTalk.

Japanese Macintosh 6.0 system software can be used on any Macintosh system with 2MB of RAM (a hard disk is strongly recommended). However, no special hardware is necessary. Although there is a localized version of the keyboard, KanjiTalk can accept input from a U.S. keyboard. In fact, the only difference between the U.S. keyboard and the Kana keyboard is the addition of the Kana characters silk-screened on the key caps.

Macintosh hardware products were originally made specifically for the Japanese market, with Kanji fonts in ROM. These products have been discontinued.

U.S. applications that abide by the Script Manager interface (TeachText, for example) generally work with Japanese Macintosh system software, but there is no guarantee of full functionality. It takes two bytes (not just one) to represent a Kanji character, and applications that don't take this into account typically don't work without some problems.

TOPIC -----

How do I revert to System 6 after installing System 7?

DISCUSSION -----

Before upgrading to System 7, back up your hard disk using any of backup and restore products available for the Macintosh. At a minimum, back up your System folder.

Please do not try to install System 6 over System 7. Instead, follow these steps:

- 1) To remove System 7 from your hard disk, boot from a System 6 "System Tools" floppy disk and drag the System 7 "System Folder" from your hard disk into the Trash can.
- 2) Restore your System 6 "System Folder" from a backup, or install from the System 6 "System Tools" floppy disk.

## System 7: Sharing LaserWriters with System 6 Computers (5/94)

Revised: 5/12/94  
Security: Everyone

System 7: Sharing LaserWriters with System 6 Computers (5/94)

Article Created: 28 February 1991  
Article Reviewed/Updated: 12 May 1994

TOPIC -----

Can users running System 7 and users running System 6 share the same LaserWriter? Does the 6.0 LaserWriter driver work with System 7?

DISCUSSION -----

The System 7 printer drivers operate on Macintosh computers running System 6 and on Macintosh computers running System 7. When all computers printing to the same printer use System 7 printer drivers, they can compatibly share a printer.

Apple recommends that you upgrade System 6 Macintosh computers that are on a network with System 7 Macintosh computers to System 7 printer software. This will allow LaserWriter compatibility between both systems.

Early versions of the LaserWriter Drivers for System 7 were tested with all System 6 versions. Later LaserWriter Driver versions were only tested with System 6.0.8, and is the only System 6.x version now officially supported by Apple.

To install the LaserWriter 7 driver on a System 6 machine, follow the set of steps appropriate to your computer:

From floppy disks, follow these steps:

- 1) Insert the System 7 "Printing" disk (800K and 1.4MB). You do not need to boot from this disk. Place it in the drive of the currently running Macintosh you wish to update. This installation occurs "live" on your current system.
- 2) Double click the "Printer Update" icon.
- 3) Double click "Install". The System 7 printing software is now being

installed on your system

- 4) Choose Quit. Your system has been updated to the System 7 printing software and is immediately ready to print in a System 7 environment.

Over a network, follow these steps:

- 1) Ask your network administrator where the "Printer Update" installer is located on your network and open that folder.
- 2) Locate and double click on the "Printer Update" icon.
- 3) Double Click "Install". The System 7 printing software is now being installed on your system
- 4) Choose Quit. Your system has been updated to the System 7 printing software and is immediately ready to print in a System 7 environment.

After installation, open the Chooser and select the appropriate printer. If a dialog box appears asking if you want to initialize the printer, click "Yes". Make sure that all users on the network using this printer are running either System 7 or have updated their printing software to System 7.

Alternatively, you can simply drag the System 6 LaserWriter driver and the Laser Prep file to the trash. Then drag the System 7 LaserWriter driver to the System Folder.

## System 7: Diagnosing System Bombs

Revised: 5/23/91  
Security: Everyone

System 7: Diagnosing System Bombs

=====

Article Created: 28 February 1991  
Article Last Reviewed: 22 July 1992  
Article Last Updated: 22 July 1992

TOPIC -----

I've installed System 7 and it bombs. What should I do?

DISCUSSION -----

If your system bombs, proceed as follows:

- 1) Restart your Macintosh while holding down the Shift key, and release it when the desktop appears. This action causes most of your system extensions (INITs) and control panels not to load when the system boots. (Note: In System 7, INITs are referred to as "system extensions.") After you have removed your INITs and control panels, take each one, one-by-one, and drag it to the System Folder and restart. If the system bombs again, you will be able to tell which INIT, control panel, or combination of them is causing the crash.
- 2) Open your System folder and remove all of your extensions and control panels by placing them in a separate folder outside the System Folder. Examine the system extensions and verify that you are using the current version. If necessary, contact the product developer to determine which is the current version.

If your Macintosh computer still does not start up, continue to step 3.

- 3) Restart from one of the System 7 floppies. In the System 7 disk suite, the bootable floppy is the "Disk Tools" disk (both 800K and 1.4M).
- 4) Move any fonts, desk accessories, extensions, control panels, and preference files that you want to keep from the System Folder to another folder on your hard disk. Drag the remainder of the System Folder to the

trash and empty the trash.

- 5) Do a "clean" install of the software by following the installation guidelines in your "Macintosh User's Guide."

If your Macintosh computer still does not start up, contact your dealer.

## System 7: Compatibility of Third-Party Hard Disks (4/95)

Revised: 4/3/95  
Security: Everyone

System 7: Compatibility of Third-Party Hard Disks (4/95)

Article Created: 1 March 1991  
Article Reviewed/Updated: 03 April 1995

TOPIC -----

Are third-party hard disks compatible with System 7?

DISCUSSION -----

Yes. Virtually all of the third-party hard disks tested by Apple are compatible with System 7.

However, you may run into problems if your hard disk driver software (also called formatting software) is out of date. Most hard disk vendors revised their formatting software for System 7. Alternatively, you may try a third-party driver utility like Silverlining or Drive 7. Apple's utility, HD SC Setup, works only with Apple hard disks. Version 7.0 of HD SC Setup comes with System 7.

If you have a question about a specific third-party hard disk or driver version, contact the vendor.

### Article Change History

-----

03 Apr 1995 - Corrected wording of Silverlining.  
01 Sep 1992 - Revised to add more detail about drivers.

## System 7: A Multitasking Operating System

Revised: 3/21/91  
Security: Everyone

System 7: A Multitasking Operating System

=====

Article Created: 1 March 1991

### Article Change History

-----

08/25/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Is System 7 a multitasking operating system?

### DISCUSSION -----

Yes. Multitasking (previously known as MultiFinder) has been integrated into the system, so that System 7 is a multitasking operating system. With multitasking, people can work with several programs at the same time and even do some operations concurrently, like working while printing or copying files or recalculating a spreadsheet. With several programs running and available, people get more effective use from the computer.

In System 7, background printing and background copying of files are standard features. Consult your software developer for details on other multitasking capabilities.

At a more technical level, multitasking is the ability to do a number of tasks concurrently. System 7 uses a cooperative multitasking implementation to run several applications concurrently while doing tasks in the background.

## System 7: When an Application from System 6 Won't Open

Revised: 5/23/91  
Security: Everyone

System 7: When an Application from System 6 Won't Open

=====

Article Created: 1 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Why can't I open a document under System 7 that I opened under System 6?

DISCUSSION -----

Because applications share available memory, your application may not have enough memory to open your document. You can easily increase the amount of memory that your application uses with System 7, so that you can open and work with any of your existing documents.

Here is a procedure to increase application memory:

- 1) Quit the application.
- 2) Find and select the application.
- 3) Choose Get Info from the File menu in the Finder.
- 4) At the bottom of the Info box is a field labeled "Application Memory Size." The number in this box is the amount of memory (like 1024K) used by the application when you run it.
- 5) To increase the memory for this application, change the number in the Application Memory Size field. For example, if you are running a Macintosh computer with 4MB of RAM, you might increase the number to as much as about 3000K. Consult your application's manual for specific recommendations.

Of course, you can always add more RAM memory to the computer.

## System 7: Not Enough Memory... Message (10/94)

Revised: 10/11/94  
Security: Everyone

System 7: "Not Enough Memory..." Message (10/94)

Article Created: 1 March 1991  
Article Reviewed/Updated: 10 October 1994

TOPIC -----

When it's difficult to open applications or print, these tips will help you use Macintosh memory more efficiently. For more information about managing memory, see the "Macintosh User's Guide".

DISCUSSION -----

To use System 7, your Macintosh needs at least 2MB of memory (4MB is recommended). If you customarily work with several programs at a time, you may wish to install more memory.

Use the Available Memory  
=====

If you get a message asking if you'd like to open a program using the available memory, click OK, and the program will open. This message appears when the available memory is greater than the minimum memory required to open the program, but less than the recommended amount. In rare cases, you may be unable to use some features of the program.

Quit Some Open Programs  
=====

When you open an application and see the "not enough memory" message, you should quit one or more open programs. Open the Application menu (right end of the menu bar) to see which programs are open. This message appears when the available memory is less than the minimum required to open the program.

Change a Program's Memory Size  
=====

You can often avoid memory problems by reducing or sometimes increasing a

program's current memory size. In rare cases, reducing a program's memory size degrades performance.

Sometimes the "not enough memory" error is telling you that your system may have enough RAM available, but the application's "preferred memory size" is set too low. Check About This Macintosh in the Apple menu for the largest free block size to ensure that you have enough free space; increase the Preferred Size (Step 4 in the following table) to a larger amount (you may need to experiment). Follow these steps to change a program's memory size:

| STEP | ACTION                                                                 |
|------|------------------------------------------------------------------------|
| 1    | Quit the program.                                                      |
| 2    | In the Finder, select the program's icon.                              |
| 3    | Choose Get Info from the File menu. The program's Info window appears. |
| 4    | Reset the memory size in the Preferred Size field.                     |
| 5    | Close the Info window                                                  |
| 6    | Try again to open the program.                                         |

#### Turn Off Background Printing

=====

When background printing is on, you can print while using the computer for other work. If you don't need background printing, you can reduce the amount of memory required to print by turning it off. Follow these steps to turn off background printing:

| STEP | ACTION                                            |
|------|---------------------------------------------------|
| 1    | Choose the Chooser from the Apple menu.           |
| 2    | In the Chooser window, select a LaserWriter icon. |
| 3    | Click the Background Printing: Off button.        |

#### Quit Some Programs Before Printing

=====

When you print, you'll sometimes see the Application menu begin to blink. When this happens, follow these steps to quit a program and make more memory available for printing:

| STEP | ACTION                                                                                       |
|------|----------------------------------------------------------------------------------------------|
| 1    | Choose Finder from the Application menu. You'll see an alert box.                            |
| 2    | Click OK to close the alert box.                                                             |
| 3    | From the Application menu, choose the program you want to close. The program becomes active. |
| 4    | Choose Quit from the File menu.                                                              |

After quitting one or more programs, try printing again.

Set the Disk Cache to the Smallest Size

=====

The disk cache is a portion of the computer's memory set aside to limit how often the computer must read from a disk. This speeds up the computer's performance. By reducing the size of the disk cache, you can make more memory available for application programs. Follow these steps to adjust the disk cache:

| STEP  | ACTION                                                                                                           |
|-------|------------------------------------------------------------------------------------------------------------------|
| ----- | -----                                                                                                            |
| 1     | Choose Control Panels from the Apple menu.                                                                       |
| 2     | Open the Memory control panel (double-click the Memory icon).                                                    |
| 3     | In the Memory control panel, click the down arrow repeatedly until the disk cache is the smallest possible size. |
| 4     | Choose Restart from the Special menu to restart the Macintosh.                                                   |

#### Drag Optional Extensions Out of the Appropriate Folders

=====

Extensions (also known as INITs) compete with application programs for memory. (System extension icons are often displayed in the bottom-left portion of the screen when the computer starts up.) There are three types of extensions:

- Control Panels
- System Extensions
- Chooser Extensions

These extensions may be located in any of these folders:

- Control Panels folder
- System Folder
- Extensions folder

You can conserve memory by removing system extensions that you don't need. For instance, if your Macintosh is not connected to a host database, you can remove the DAL (Data Access Language) system extension. Likewise, if your Macintosh is not connected to a network, you can remove the AppleShare system extension. Follow these steps to remove system extensions:

| STEP  | ACTION                                                                                         |
|-------|------------------------------------------------------------------------------------------------|
| ----- | -----                                                                                          |
| 1     | Open the System Folder.                                                                        |
| 2     | Open the appropriate folders                                                                   |
| 3     | Drag the system extension icon out of the System Folder to another location on your hard disk. |
| 4     | Restart the computer.                                                                          |

#### Turn Off File Sharing

=====

When file sharing is turned on, you can share information on your computer's hard disk with other users on a network. If you don't currently use file sharing, you can conserve memory by turning it off or removing it from the

Extensions folder. Follow these steps to turn off file sharing:

| STEP | ACTION                                                                                                                                                                          |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Choose Control Panels from the Apple menu.                                                                                                                                      |
| 2    | Open the Sharing Setup control panel (double-click the Sharing Setup icon).                                                                                                     |
| 3    | Click Stop in the File Sharing section of the Sharing Setup control panel. A message appears asking how many minutes the computer should wait until file sharing is turned off. |
| 4    | Type a number and click OK.                                                                                                                                                     |

Restart the Computer

=====

If you have opened and closed a number of programs, your Macintosh memory can become fragmented so that you can't open a large program. When this happens, quit all the open programs, and restart the computer and then open the program.

## System 7: Extensions Folder

Revised: 9/13/95  
Security: Everyone

System 7: Extensions Folder

=====

Article Created: 1 March 1991  
Article Reviewed/Updated: 13 September 1995

TOPIC -----

What is the role of the Extensions folder?

DISCUSSION -----

The Extensions folder inside the System 7.x System Folder contains "system extensions" (previously known as "INITs"), and miscellaneous software additions to your Macintosh computer, such as printer drivers and network drivers.

The Extensions folder is the first place that the System looks when loading system extensions at startup.

System 7.x implements a new capability for automatic installation for system resources. When you drag a system extension (INIT), control panel, font, or a desk accessory onto the icon of the System folder, the system automatically determines where the resource should go and places it there. If you drag a system extension (INIT) onto the icon of the System Folder, it gets placed in the Extensions folder.

## System 7: Sharing a Hard Disk with a System 6 Macintosh

Revised: 5/23/91  
Security: Everyone

System 7: Sharing a Hard Disk with a System 6 Macintosh

=====

Article Created: 1 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can I move a hard disk between a Macintosh computer running System 6 and a Macintosh computer running System 7?

DISCUSSION -----

Yes. You can move hard drives between Macintosh computers running System 6 and System 7. When a hard disk is moved from System 6 to System 7, you will see a dialog box when you start stating that "This disk is being updated for new system software". This process does not affect any data on your disk. Rather, it means the system is creating a new System 7 Desktop file on the hard disk. Afterwards, you may use your hard disk as usual.

When a hard disk is moved from System 7 back to System 6, you will notice a few differences under System 6. First, you should rebuild the Desktop of the hard disk by holding down the Command and Option keys, while starting the Finder. If you don't do this, the first time you go back to System 6, some icons may not appear properly.

You may also notice two new folders which appear on your hard disk under System 6 which were not present under System 7. The first of these is the Desktop folder which will contain any items which you placed on the desktop under System 7. The second folder you will see under System 6 is the Trash folder. This folder will contain any items which were dragged to the Trash (but not emptied) under System 7.

Moving a disk between System 6 and System 7 is safe and will not damage any data.

Note: Locked media created under System 7 cannot be mounted under System 6

until they are unlocked.

## System 7: Compatibility of System 6 Desk Accessories

Revised: 9/2/92  
Security: Everyone

System 7: Compatibility of System 6 Desk Accessories

=====

Article Created: 1 March 1991

### Article Change History

-----

09/01/92 - REVIEWED

- For technical accuracy; edited.

### TOPIC -----

Will my System 6 desk accessories work under System 7?

### DISCUSSION -----

Yes. Most all desk accessories (DAs) written for System 6 run under System 7. To use a System 6 desk accessory, you must first take it out of its "suitcase". Follow these steps:

- 1) Locate the desk accessory. It should appear in a file that has a suitcase icon. (Unless it was already part of the System 6 System file - in which case it would be in the System 7 System file.)
- 2) Open the suitcase icon by selecting it and choosing Open from the File menu, or by double-clicking on the suitcase. The suitcase will open into a window and show the desk accessory inside.
- 3) Drag the desk accessory out of the window and onto your hard drive. You can put the desk accessory anywhere on your hard drive. If you want to access the desk accessory from the Apple Menu, put the desk accessory in the Apple Menu Items folder.

Some desk accessories, like spell checkers and art effects, will need special installation procedures to work properly with System 7 (they may need to be installed in the System file, though Apple does not endorse or

recommend this method). Check with the software developer for additional details on using these DAs with System 7.

## System 7: Desk Accessories and the Apple Menu Items Folder

Revised: 9/15/92  
Security: Everyone

System 7: Desk Accessories and the Apple Menu Items Folder

=====

Article Created: 1 March 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Do Desk Accessories have to be in the Apple Menu Items folder?

### DISCUSSION -----

No. You may put and use your desk accessories anywhere on your hard disk (including the desktop or in the Apple Menu Items folder).

### Putting a Desk Accessory into the Apple Menu

-----

If you want to put a desk accessory into the Apple menu, drag the desk accessory onto the System Folder icon. Your desk accessory will automatically get placed in the Apple Menu Items folder.

### Moving a Desk Accessory from The Apple Menu to the Desktop

-----

If you want to remove a desk accessory from the Apple Menu and put it on the desktop instead, follow these steps:

- 1) Open your System folder.
- 2) Locate and open the Apple Menu Items folder.
- 3) Locate the desired desk accessory and drag it out of the Apple Menu Items folder and onto the desktop.

Using a Desk Accessory from System 6

-----  
You may find that older desk accessories appear in desk accessory suitcases. To use such a desk accessory, open the suitcase by double-clicking it. Then, drag the desk accessory out of the suitcase window. You can now use the desk accessory.

## System 7.x: Apple Menu Items Limit (2/95)

Revised: 2/21/95  
Security: Everyone

System 7.x: Apple Menu Items Limit (2/95)

Article Created: 1 March 1991  
Article Reviewed/Updated: 21 February 1995

TOPIC -----

Is there a limit to the number of items in the Apple Menu?

DISCUSSION -----

System 7.x has a defined limit of no more than 52 items displayed in the Apple Menu Items Folder.

The value of 52 was set for performance reasons. Basically, when more than 52 items are in the Apple Menu Items Folder, the amount of available RAM for processing is limited (especially when the menu items has color icons), drastically slowing the display of menus. Thus, a decision was made to take into account what "acceptable" performance was, and the value of approximately 52 menu items was the threshold amount.

You can still place more than 52 items in the Apple Menu Items Folder, but only the first 52 (alphabetically by name) are displayed. Refer to the article titled "System 7.x: Changing Sequence of Apple Menu Items" to ensure the menu items you want are alphabetically in the first 52 menu items.

Here are a couple of workarounds:

- Have folder aliases in the Apple Menu Items Folder.
- Use the hierarchical menus in System 7.5 (or a third-party software that provides hierarchical menus). Hierarchical menus in System 7.5 are controlled through the Apple Menu Options Control Panel.

## System 7: INITs or System Extensions in System 7

Revised: 9/25/92  
Security: Everyone

System 7: INITs or System Extensions in System 7

=====

Article Created: 1 March 1991

### Article Change History

-----

09/25/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

How are INITs loaded in System 7?

### DISCUSSION -----

In System 7, INITs are referred to as "system extensions." The system looks for extensions in three places when loading them at boot time:

- First, it looks in the Extensions folder (located in the System Folder). This is the proper place to put your compatible INITs or system extensions.
- Second, it looks in the Control Panels folder (also inside the System Folder).
- Third, it loads any extensions it finds at the root level of the System Folder itself.

## System 7: How to Disable System Extensions (8/95)

Revised: 8/17/95  
Security: Everyone

System 7: How to Disable System Extensions (8/95)

Article Created: 1 March 1991  
Article Reviewed/Updated: 17 August 1995

TOPIC -----

Can I disable system extensions (previously called INITs) under System 7?

DISCUSSION -----

Yes. If your system crashes when you first turn it on, or if you are experiencing unexpected behavior with an application or in the Finder itself, you may have one or more system extensions (INITs) that are incompatible with System 7 or with each other.

If you suspect that problems you are experiencing with your system are due to extensions loaded in your System Folder, Extensions folder, or Control Panels folder, you can temporarily disable them by holding down the Shift key as you start your computer.

After you have started your Macintosh while holding down the Shift key, you can remove any extensions that may be causing problems. The next time you restart, all of your extensions will load as usual.

Holding down the Shift key when you start the computer turns off all extensions that may cause other things on your system not to work. You should do this only when you think a newly-added extension is the cause of your problems. Some system extensions are needed to do essential things like share files, access file servers, access CD-ROMs, and so on. However, you can continue to print even with the extensions disabled.

## System 7: INIT Does Not Work in the Extensions Folder

Revised: 3/21/91  
Security: Everyone

System 7: INIT Does Not Work in the Extensions Folder

=====

Article Created: 4 March 1991

### Article Change History

-----

08/20/92 - REVISED

- To make more clear; edited.

### TOPIC -----

What should I do if an INIT does not work in the Extensions folder?

### DISCUSSION -----

INITs (called "system extensions" in System 7) that do not work when loaded to the Extensions folder should be moved to the root level of the System folder. Some INITs written for System 6 expect to be at the same folder level as the System file.

To put an INIT into the root level of the System folder without having it automatically routed to the Extensions folder, open the System Folder and drag the INIT into the folder's open window, rather than onto the icon of the System Folder. Automatic routing only occurs when you drop something onto the icon of the System folder.

If the INIT still doesn't work at the root level of the System Folder, check with the source to make sure the INIT is compatible with System 7.

## System 7: How to Find with Multiple Criteria

Revised: 3/21/91  
Security: Everyone

System 7: How to Find with Multiple Criteria

=====

Article Created: 4 March 1991

### Article Change History

-----

08/21/92 - UPDATED

- To add information about "cannot display all items" message.

### TOPIC -----

How can I do a Find with multiple criteria?

### DISCUSSION -----

Do this through the "Find..." dialog in the Finder:

- 1) Click on the "More Options" button.
- 2) Select the first criterion you want to search and check "all at once".
- 3) Click the Find button.
- 4) After all the files meeting the first criterion are found and selected, choose "Find, More Options", enter the second criteria, and select "Search: the selected items".
- 5) Click the Find button.

Only those items that meet both criteria remain selected. You can repeat this procedure to narrow the search as much as you need.

If you get a message that not all items meeting the criteria could be displayed at once, the most likely reason is that some items are at the desktop level and could not be displayed in the window. Try moving those

items from the desktop into the root level window of the volume. The other possible reason for the message is that you have run out of memory due to too large a search result. Try quitting any open applications to free up more memory.

## System 7: How to Install FKEY Resources

Revised: 9/15/92  
Security: Everyone

System 7: How to Install FKEY Resources

=====

Article Created: 4 March 1991

### Article Change History

-----

09/14/92 - REVISED

- To provide more information.

### TOPIC -----

How do I install FKEY resources to be used with System 7?

### DISCUSSION -----

As in System 6, FKEYs must be installed using a "resource moving" utility like ResEdit (version 2.0 or later).

Installing System 7 over a previous system does not remove FKEYs that were already installed in your system.

Note: The screen-capture FKEY (invoked by pressing Command-Shift-3) has been much improved in System 7. When you press Command-Shift-3, the system takes a "snapshot" of your screen and creates a TeachText file of the image. The resulting file contains an accurate image of your screen, even displaying colors and the image from multiple attached monitors.

System 7: The Little Triangle Beside Each Folder

=====

Article Created: 4 March 1991

### Article Change History

-----

08/21/92 - UPDATED

- To include keyboard shortcut.

### TOPIC -----

When I'm in View by Name, Size, or Date, I see a little triangle beside each folder. What does it do?

### DISCUSSION -----

When you are in a list view (View by Name, Size, Kind, Label, Date), notice that each folder has a small triangle just to its left. Clicking this triangle displays the contents of that folder in the same window.

With the icon of a folder selected, Command-right arrow will flip the triangle down and display the contents of the folder just like clicking on the triangle; Command-left arrow will flip the triangle back up and hide the contents of the folder.

If you want to view the contents of that folder in a separate window, double-click the folder icon, or select the icon and choose Open from the File menu.

## System 7: How to Rename File and Folder Icons

Revised: 3/21/91  
Security: Everyone

System 7: How to Rename File and Folder Icons

=====

Article Created: 4 March 1991

### Article Change History

-----

08/21/92 - UPDATED

- With additional tips on renaming.

### TOPIC -----

How do I rename file and folder icons in System 7?

### DISCUSSION -----

In Finder 7.0, renaming icons is slightly different from System 6. To rename an icon you must click directly on the name of the icon and wait for the cursor to change to an I-beam. A box will appear around the name of the icon and you can then edit the name. The speed at which the box appears, making the file or folder name editable, is dependent on the double-click speed in the Mouse control panel.

But if you don't want to wait for the cursor to change to an I-beam, you can click once on the file or folder name and drag the cursor off the name. This will make the name immediately editable. Alternately, click anywhere on the icon and press Return to make the name immediately editable.

    • For accuracy.  
08/24/92 - REVIEWED  
    • For technical accuracy.

### TOPIC -----

Can I customize an icon in System 7?

### DISCUSSION -----

Yes. Here's how to customize an icon in System 7:

- 1) Select the graphic you want to use for an icon. An icon in the Get Info window of any document is a possible source.
- 2) Copy the graphic to the Clipboard by choosing Copy from the Edit menu.
- 3) In the Finder, select the icon you want to change.
- 4) Choose Get Info from the File menu.
- 5) Ensure that the Locked box in the lower-left corner of the Get Info window is not checked. You cannot customize the icon of a locked file.
- 6) Click the icon at the upper left of the Get Info window to select it.
- 7) Choose Paste from the Edit menu.

8) Click the close box to close the Get Info window.

You can change an icon back by clicking the icon in the upper-left corner of the Get Info window and choosing Cut or Clear from the Edit menu.

#### Notes

-----

- If the selected graphic is bigger than the icon in the Get Info window, it automatically shrinks to fit.
- Some icons cannot be customized, including those for locked items, control panels, and other parts of the system software.

System 7: What Happened to the "Set Startup" Menu Item

=====

Article Created: 4 March 1991

### Article Change History

-----

08/24/92 - REVISED

- To give more details.

### TOPIC -----

What happened to the "Set Startup" menu item that was in System 6?

### DISCUSSION -----

"Set Startup" under System 6 lets you switch between the Finder and MultiFinder and set certain applications and desk accessories to open automatically when you turn on your Macintosh.

System 7 has added more flexibility to this feature. Using System 7, you can have applications, documents, control panels, desk accessories, or aliases open automatically when you start you Macintosh.

To do this, just put the items you want opened into the Startup Items folder inside the System folder. If you want an application to open at startup but you don't want to move it from its current location, just make an alias of it and put that into the Startup Items folder.

## System 7.x: PrintMonitor Documents Folder (7/93)

Revised: 7/9/93  
Security: Everyone

System 7.x: PrintMonitor Documents Folder (7/93)

Article Created: 4 March 1991

### Article Change History

07/08/93 - UPDATED

- To mention host computers that use Grayshare for some direct-connect printers.

09/16/92 - UPDATED

- With information about ImageWriter and StyleWriter.

### TOPIC

What does the PrintMonitor Documents folder do?

### DISCUSSION

With System 7, you can print to a LaserWriter or a StyleWriter while you do other work with your Macintosh. For instance, you can print and continue working on a document at the same time. This is called "background printing."

When background printing is turned on for printers in the Chooser, files waiting to be printed are temporarily stored in the PrintMonitor Documents folder until the printer is ready to print them. This is all done in the background.

Direct-connect printers that use Grayshare, such as the Apple Color Printer, the StyleWriter II, the Personal LaserWriter 300, also use the PrintMonitor documents folder. The host computer handles the printer spooling, and temporarily stores files in the PrintMonitor Documents folder.

The ImageWriter does not support background printing.

Security: Everyone

System 7: Views Control Panel

Article Created: 4 March 1991

### Article Change History

09/16/92 - REVISED

- To show additional display tip about putting icons in order.

### TOPIC -----

What does the Views control panel do?

### DISCUSSION -----

The Views control panel in System 7 controls how the files and windows on your desktop are displayed.

You can change the font and font size the Finder uses to display icons, and how icons are arranged when you select Clean Up from the Special menu.

Another option is selecting how information is displayed in various list views (View by Name, Date, Kind, Size, Label). You can also change things like icon size, space available display, and what type of information should appear.

If you want to arrange your files in an icon view but in order of name, date, kind, size or label, first display the files by the view by which you want to sort (using the View menu. Then, change your view to one of the icon views, hold down the Option key, and choose Clean Up by... from the Special menu. Your last chosen view will be the parameter by which the icons are sorted.

Security: Everyone

System 7: The "Some items could not be opened" Message

=====

Article Created: 4 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Why do I get the message "Some items could not be opened" when I start my Macintosh?

DISCUSSION -----

When a Macintosh starts, it looks inside the folder "Startup Items" inside the System folder and tries to open all of the icons it finds in that folder. This is useful when you have applications, documents, desk accessories, and control panels that you want to have opened automatically at startup.

If you see the message "Some items could not be opened" you have probably placed an icon that cannot be opened (like an INIT, system extension, printer driver, and so on) inside your Startup Items folder.

## System 7: File Sharing Performance Compared with AppleShare

Revised: 9/4/92  
Security: Everyone

System 7: File Sharing Performance Compared with AppleShare

=====

Article Created: 4 March 1991

### Article Change History

-----

09/04/92 - REVISED

- To clarify and provide additional information and numbers from other sources.

### TOPIC -----

How does file sharing differ from the AppleShare File Server?

### DISCUSSION -----

AppleShare File Servers are designed to perform much better than Macintosh computers using file sharing when large numbers of users with heavy load requirements are involved. Service from a Macintosh with AppleShare File server software performs approximately 25 percent better than a Macintosh using file sharing for the same configuration.

File sharing lets an individual directly share and control sharing of folders of information with a small group of individuals. An AppleShare file server provides centralized control of sharing by an Administrator for a large group of individuals. File sharing is built around the Macintosh user with the focus and emphasis on personal control of sharing local folders. The distinguishing marks of centralized file service includes issues regarding administration for large workgroups, performance, and central access. System 7's file sharing is a form of distributed file sharing.

Performance and access needs will determine which approach provides the best service. File sharing is best suited for small workgroup focus, with optimal performance for low sharing load situations. Centralized file servers like AppleShare are designed for high traffic with large numbers of

users and are designed for continuous operation with no interruptions.

Using file sharing, up to 10 folders per machine can be shared, each having an unlimited number of enclosed folders. Up to 10 guest users can be connected to a networked hard disk, with up to 50 guest users identified in the Users and Groups file. This contrasts with 120 concurrent users for AppleShare 3.0.

## System 7: Sharing Files with a System 6 Macintosh

Revised: 9/4/92  
Security: Everyone

System 7: Sharing Files with a System 6 Macintosh

=====

Article Created: 5 March 1991

### Article Change History

-----

09/04/92 - EDITED  
• For clarity and technical accuracy.

### TOPIC -----

If I am running System 7, can I share files, documents, or folders with a Macintosh running System 6?

### DISCUSSION -----

Yes. To set up your Macintosh computer to share files, documents, or folders, follow the instructions on setting up file sharing in the Macintosh User's Guide or search for other articles on the subject. You can share folders with any Macintosh (from the 512k enhanced and up), the Apple II, and any MS-DOS computer that uses AppleShare workstation software. Apple II and MS-DOS computers require special software and, in some cases, hardware.

## System 7: How to Use File Sharing

Revised: 9/4/92  
Security: Everyone

System 7: How to Use File Sharing

=====

Article Created: 5 March 1991

### Article Change History

-----

07/25/91 - REVIEWED

09/04/92 - REVISED

- To include additional information from other articles and correct other information.

### TOPIC -----

What is file sharing? How do I turn file sharing on? How can I use file sharing to share files between my portable and my desktop Macintosh?

### DISCUSSION -----

Macintosh file sharing is a powerful feature of Macintosh System 7 that lets you share your folders (and their files) with other people on a network. File sharing operates on any Macintosh that can run System 7 and is connected to an AppleTalk network. With your permission, others can view and even edit documents on your hard drive from their machines. Macintosh file sharing works between two or more Macintosh computers and you don't need to dedicate a Macintosh as a file server. Macintosh file sharing includes powerful security features, so that you may control access to your information through the specification of passwords privileges people have, for example read or write privileges.

Ten users can be connected to a shared volume at one time. You can directly share up to ten folders. Once a folder is shared the folders contained within the shared folder are automatically shared as well, and they do not get counted as part of the ten directly shared folders.

Before you can share files, you must turn on the file sharing capability.

Doing so takes an extra 268K of memory. Once you turn it on, it stays on until you turn it off again, including when you later restart your computer.

## How to Turn on File Sharing

-----

- 1) Choose Control Panels from the Apple menu and double-click the Sharing Setup control panel.
- 2) Make sure that you have identified your computer to the network. You have to give an Owner Name, an Owner Password, and a Macintosh Name.
- 3) Click the Start button. Its label changes to "Cancel" and the status line describes what is happening while file sharing is starting up. It may take a minute or so to complete. When the status line says "File sharing is on" and the button is labeled "Stop," your computer is ready to share files. If you start file sharing when AppleTalk is not active, it will be automatically turned on for you.
- 4) Close the Sharing Setup control panel and the Control Panels folder.

## How to Share a Folder

-----

Follow these steps:

- 1) Select the folder.
- 2) Choose Sharing from the File menu.
- 3) Click Share This Item And Its Contents.
- 4) Close the Privileges Window.
- 5) When asked for confirmation, click Save.

## How to Log on as Owner

-----

As the owner or administrator of two Macintosh systems - a desktop and a portable model for example - file sharing can be even easier. An AppleTalk network can be as small as two Macintosh computers connected together with LocalTalk (or compatible) cabling. Once connected together, either Macintosh computer can turn on file sharing. There is no need to share folders, because the owner can access everything. From the other Macintosh, you can connect with the AppleShare workstation software as the owner. Follow these steps to connect remotely as the owner:

- 1) Open the Chooser.
- 2) Select AppleShare.
- 3) Select your Macintosh computer.

- 4) Type your name, as you typed it in Owner Name field in the Sharing Setup dialog on the Macintosh you are connecting to.
- 5) Type your password, as you typed it in Owner Password field in the Sharing Setup dialog on the Macintosh you are connecting to.

You will see all the disk resources connected to the remote Macintosh as if you are looking directly at its desktop. Make an alias of the volume for even easier future access.

## System 7: How to Disable File Sharing

Revised: 9/4/92  
Security: Everyone

System 7: How to Disable File Sharing

=====

Article Created: 5 March 1991

### Article Change History

-----

09/04/92 - REVISED

- To provide additional information.

### TOPIC -----

Can file sharing be disabled?

### DISCUSSION -----

Yes. File sharing can be disabled in two ways:

- By not enabling the sharing functionality with the Sharing Setup control panel (the button next to File Sharing should say "Start").
- By not installing the file sharing software. Either choose the Custom option in the system software Installer program, or simply drag the File Sharing extension out of the Extensions folder in the System Folder.

Here are the steps for turning off File sharing:

- 1) Open your Control Panel folder.
- 2) Open Sharing Setup Control Panel.
- 3) Click the "Stop" button for file sharing. The button name should change to "Start".

## System 7: Sharing Applications

Revised: 8/24/92  
Security: Everyone

System 7: Sharing Applications

=====

Article Created: 5 March 1991

### Article Change History

-----

08/24/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Can I share applications with System 7?

### DISCUSSION -----

Yes. You can share applications in two ways:

- by sharing the folder that contains the application, so that multiple users can access it; and
- by sharing the program directly for access by remote program linking.

If you share the program by sharing the folder that it is in, then you must be aware of two issues:

- Some applications are not multi-user or AppleShare-aware and so cannot be used by more than one person at a time.
- You must adhere to the software license agreement provided with the application. Most applications only allow one user per copy.

Security: Everyone

System 7: Sharing Files with PCs

=====

Article Created: 5 March 1991

### Article Change History

-----

09/01/92 - UPDATED

- To include search information for Farallon.

### TOPIC -----

Can I use File sharing with PCs?

### DISCUSSION -----

MS-DOS-based computers can access folders and files shared by Macintosh computers by using the AppleShare PC software available from Farallon Computing. This software provides the same capabilities that Macintosh computers have when connecting to shared folders with the AppleShare workstation software.

The Farallon product is PhoneNET Talk software, formerly AppleShare PC. With it, any MS-DOS or Windows personal computer can share networked printers, file servers that support AppleTalk Filing Protocol (AFP), and AppleTalk network applications over an AppleTalk network.

For more information, search for Farallon Computing.

## System 7: File Sharing and Multi-user Access to a Document

Revised: 9/4/92  
Security: Everyone

System 7: File Sharing and Multi-user Access to a Document

=====

Article Created: 5 March 1991

### Article Change History

-----

09/04/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Does File sharing let several people access one document simultaneously?

### DISCUSSION -----

Support for multi-user access to a document depends on the application. All the major Macintosh database programs support multiple-user access to a shared data file and many other Macintosh programs are AppleShare-aware to the point that they also support multi-user access to a single document. Some applications, like Microsoft Word, let a user open a shared document as "read-only." This means that other users can also open the same document as read-only.

System 7: File Sharing and TOPS/Novell/3Com Products

=====

Article Created: 5 March 1991

### Article Change History

-----

09/01/92 - UPDATED

- To provide contact information.

### TOPIC -----

Does File sharing work with TOPS/Novell/3Com products?

### DISCUSSION -----

Yes. Users can connect to shared information through a variety of means. Using the AppleShare workstation software yields the most consistent results. File sharing, Novell, 3Com, and other vendors support the AppleShare workstation software. Other vendors that don't support the AppleShare workstation software can coexist with AppleShare solutions.

However, once shared, folders accessed with the AppleShare workstation software cannot be "re-shared" with Macintosh File sharing. Macintosh File sharing only lets you share locally connected folders.

For more information, contact the individual vendors of your network setup.

System 7: Heavy File Sharing Can Slow Macintosh

=====

Article Created: 5 March 1991

### Article Change History

-----

09/04/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Will File sharing slow down my Macintosh when someone logs onto it?

### DISCUSSION -----

File sharing operates during the idle cycles on a user's machine. How often it uses those idle cycles or makes a higher-level request for more cycles depends on how heavy the requests are from the remote users connected to your Macintosh computer. During heavy access requests for files from remote users, the Macintosh manifests mouse jumping and varying degrees of slowness.

System 7: Using Publish and Subscribe

=====

Article Created: 6 March 1991

### Article Change History

-----

09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

How does Publish and Subscribe work?

### DISCUSSION -----

Publish and Subscribe work only with applications that have been revised to take advantage of this feature in System 7.

To use Publish and Subscribe, follow these steps:

- 1) Select some data you want to place in another application or document as a "live" copy.
- 2) From the Edit menu, select "Create Publisher". This brings up a dialog box asking you to name the Edition file that will connect the Publisher to the other documents subscribing to this data.
- 3) After you have created the Edition file, go to the document or application where you want to use this data and select "Subscribe To..." from the Edit menu.

This places a live copy of the data in your document. From this point on, whenever you modify the original publisher data, the Subscriber is automatically updated, too.

## System 7: Why Upgrade

Revised: 9/17/92  
Security: Everyone

System 7: Why Upgrade

=====

Article Created: 28 February 1991

### Article Change History

-----

09/16/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Why should I upgrade to System 7?

### DISCUSSION -----

Apple recommends that all Macintosh users upgrade to System 7. Finder 7.0 offers powerful new capabilities and greater ease of use. Its features include:

- Fast access to your information. System 7 offers a fast file-find, so you can locate your files quickly and easily. You can also access your most frequently-used files, applications, and folders from the Apple Menu.
- More flexible ways to view files. For example, by selecting the Outline view, you can see several folders in one window simultaneously. Another facility called "aliases" helps you organize your hard disk the way you want.
- Virtual Memory with System 7. Without adding more RAM, you can have more memory to run more applications through virtual memory and 32-bit addressing. With virtual memory, the computer uses part of the hard disk to increase the amount of physical memory. For example, a 4MB Macintosh computer appears to have 8MB. With this additional memory, you can run more applications. 32-bit addressing makes it possible to access more than 8MB of memory in their system.

- Share files on your Macintosh with others. You can share your files with other people on the same network without dedicating a computer to act as a file server.
- The ability to access information regardless of where it's located.
- Multitasking. You can run several applications simultaneously for greater productivity. For example, you can work on a memo while printing a spreadsheet.
- Improved window handling.
- Improved text with TrueType fonts. You will see sharper-looking text on both your screen and your printer.
- A color interface for Macintoshes supporting color.
- A complete on-line Help system using System 7's new Balloon Help.

All of the things mentioned above work without you having to buy a new application. System 7 maintains and enhances your investment in your computer and your applications. In addition, software developers are working on many new and powerful applications that take full advantage of System 7 features.

See the "What's New in System 7" guide for more details.

## System 7: How to Install It

Revised: 9/15/92  
Security: Everyone

System 7: How to Install It

=====

Article Created: 28 February 1991

### Article Change History

-----

09/14/92 - REVISED

- To provide additional information.

### TOPIC -----

How do I install System 7?

### DISCUSSION -----

System 7 ships with an application named "Installer" that installs System 7 onto your Macintosh computer. You can run Installer from a set of floppy disks or from a file server.

IMPORTANT: You cannot "drag-install" System 7. You must use the System 7 Installer to install system software.

### Installing from Floppy Disks

-----

To upgrade your Macintosh to System 7 using floppy disks, follow these steps:

- 1) Shut down your Macintosh computer.
- 2) Insert System 7's "Install 1" disk into your Macintosh computer.
- 3) Turn on your Macintosh computer and push in the "Install 1" disk.
- 4) After reading the "Welcome to the Installer" notice, click OK.

- 5) If you have more than one hard disk, use the "Switch Disk" button to select the hard disk of your choice.
- 6) Click the Easy Install button.
- 7) The Installer will instruct you to insert the remaining System 7 floppy disks.

#### Installing from a File Server

-----  
To upgrade your Macintosh computer to System 7 using an AppleShare File Server, follow these steps:

- 1) Connect to an AppleShare File Server containing System 7.
- 2) Double-click on the Installer application in the "Install 1" folder.
- 3) After reading the "Welcome to the Installer" notice, click OK.
- 4) If you have more than one hard disk, use the "Switch Disk" button to select the hard disk of your choice.
- 5) Click the Easy Install button.

By using the Easy Install button, the Installer will automatically update your Macintosh computer to System 7. Easy Install also checks to see what printer drivers and EtherTalk/TokenTalk drivers are present in your System folder. If it locates a printer driver and/or network driver that should be updated, it will do so automatically.

For more information about installing System 7, especially if you are having a difficult time or are experiencing compatibility problems, search for "System 7" and "Clean Install".

System 7: How to Upgrade over a Network

=====

Article Created: 28 February 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Can I upgrade my Macintosh computer to System 7 over a network?

### DISCUSSION -----

Yes. You can upgrade your Macintosh computer over an AppleTalk network. Your network administrator needs to have loaded the System 7 installation software onto a file server and made that software available to you. To upgrade your Macintosh computer to System 7, run the Installer from the server. It is not possible to upgrade all Macintosh computers remotely on a network from one central Macintosh computer.

### Requirements

-----

To upgrade your Macintosh computer over the network, you must have the AppleShare Workstation Client software installed on your machine. The Client software is a standard part of System 6.0.7. You can tell whether the Client software is installed on your machine by opening the Chooser and confirming that the AppleShare icon is available in the upper-left panel of the Chooser window. Check with your network administrator for additional details.

### Procedure

-----

Follow these steps:

- 1) Ask your network administrator the name of the file server and volume where the installation software is located.
- 2) Use the Chooser desk accessory to connect to the file server/volume in step 1.
- 3) On the server volume, locate the folder containing the Installer program.
- 4) Open the Installer program.
- 5) In the Installer program, choose your hard disk and click Install.

### DISCUSSION -----

No. While it is possible to install System 7 on a Macintosh computer over the network, it is not possible to force the installation of System 7 on all other Macintosh computers on the network. To upgrade multiple Macintosh computers concurrently, it is necessary to initiate the installation from each Macintosh computer.

System 7: Publish & Subscribe Requires Upgraded Applications

=====

Article Created: 7 March 1991

### Article Change History

-----

09/22/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Does Publish and Subscribe work with existing applications?

### DISCUSSION -----

No. Applications must be revised to take advantage of the publish and subscribe functionality provided by the Edition Manager in System 7.

You'll know that an application offers the publish and subscribe features when you find the items "Create Publisher" and "Subscribe To...." in the Edit menu.

Contact your vendor or your Apple Dealer to find out if your current application can be upgraded to a new version that uses the publish and subscribe capabilities.

System 7: Publish and Subscribe vs. Copy and Paste

Article Created: 7 March 1991

### Article Change History

-----  
09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

How is publish and subscribe different from Copy and Paste?

### DISCUSSION -----

Copy and Paste are useful when you want to move data between documents and applications and you want separate copies (versions) of the data in each place. Publish and subscribe maintains a connection, so that the "subscribers" always reflect the current data in the "publisher."

For example, if you want a fixed version of a document, like a "Report-Draft 3," then you could copy and paste into your document. However, if you want your document to always reflect the most recent version of "Report," then you would choose publish and subscribe.

09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What's the difference between file sharing and publish and subscribe across a network?

### DISCUSSION -----

File sharing shares entire folders (and their contents) and hard disks between users on the network. Assuming you have been given permission, you can view and edit documents just as if they were stored on your local hard drive.

Publish and subscribe lets users share sections of documents between themselves by placing the connecting edition file on a file server.

### Article Change History

-----  
09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Can I use Publish and Subscribe over a network?

### DISCUSSION -----

Yes. When an edition is created, the publisher can save the edition file on a shared file server (including your own disk if it is shared using System 7 file sharing). Other users on the network can access the edition file on the file server and subscribe to it.

For instance, Pierre needs to create a presentation using some numbers in a spreadsheet that Marie has prepared on her system. Marie can publish the numbers from her spreadsheet and save the resulting edition file to a server that she and Pierre both share. Pierre can mount the file server and subscribe to the numbers edition file in his presentation program. Whenever Marie updates the numbers in the spreadsheet, the changes appear in Pierre's copy.

Article Created: 7 March 1991

### Article Change History

-----

09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What happens when I move or delete an edition file?

### DISCUSSION -----

When you publish data for automatic updating by choosing "Create Publisher..." from the Edit menu, you also create an edition. An edition is a separate file that is updated when you change the original material. The edition file can be saved on a disk, in a folder, or on the desktop.

If you move or rename an edition file, the connection between the publisher and any subscribers remains intact.

If you delete the edition file, the connection between a publisher and its subscribers is broken.

## System 7: InterApplication Communication

Revised: 9/18/92  
Security: Everyone

System 7: InterApplication Communication

Article Created: 7 March 1991

### Article Change History

-----  
09/16/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What is InterApplication Communication (IAC)?

### DISCUSSION -----

InterApplication Communication describes the way applications use new features of System 7--the Edition Manager and AppleEvents--to cooperate more closely and improve the users' work flow.

Applications that implement the Edition Manager provide the ability to automatically update documents. New Edit menu commands let users "Publish" data to other documents and "Subscribe" to data that remains linked to the original source document. When the published data is edited, the changes are copied automatically to all its subscribers on the same machine or across the network. For example, the user can subscribe to a spreadsheet table in a word processing document. When the spreadsheet changes, the word processing document gets the change automatically.

Apple events make possible even more complex interaction between applications. It provides an invisible messaging language that will let programs share data and commands. The user sees Apple event-aware applications as those that can request services from each other. For example, an accounting package can pass inventory data to a spreadsheet and retrieve a graph of that data for display in its own report.

System 7: AppleEvents

Article Created: 7 March 1991

### Article Change History

-----  
09/16/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What is AppleEvents? Is the implementation of AppleEvents the same for all applications?

### DISCUSSION -----

AppleEvents is the underlying messaging language that applications use for complex communication with other applications. For the user, Apple event-aware applications are applications that can use services of other applications, either on the same machine or across the network. These applications use Apple-event messages as intelligent hooks to share functionality with other applications. AppleEvent implementation is application-specific, in that different types of programs will implement different sets of AppleEvents (for example, databases will use different sets of AppleEvents than word processors). All implementations will support a set of core events, which are defined by Apple.

Here are several examples:

- An accounting package can pass inventory data to a spreadsheet and retrieve a graph of that data for display in its own report.
- Utility packages like spell checkers, thesauruses, or formula editors can work generically with Apple event-aware applications.

- An application can request that a more sophisticated program display a specialized graphics format like TIFF in the requesting application window.

Applications vary in terms of how they implement AppleEvents. Check with your specific software manual for details about how to use this feature with your chosen software.

System 7: Macintosh Computers That Can Use Virtual Memory (1/95)

Article Created: 7 March 1991  
Article Reviewed/Updated: 03 January 1995

TOPIC -----

Which Macintosh computers can use virtual memory?

DISCUSSION -----

Any Macintosh computer which uses the 68030,68040, or PowerPC microprocessor can use virtual memory. A Macintosh computer with the 68020 microprocessor is virtual memory capable with the addition of a 68851 PMMU coprocessor.

A current listing of Macintosh computers which support virtual memory follows:

| Compact Macintosh:<br>-----  | Modular Macintosh:<br>----- | PowerBook:<br>----- |
|------------------------------|-----------------------------|---------------------|
| Macintosh SE/30              | Macintosh II*               | PowerBook 140       |
| Macintosh Classic II         | Macintosh IIX               | PowerBook 145       |
| Macintosh Color Classic      | Macintosh IICx              | PowerBook 145B      |
|                              | Macintosh IICI              | PowerBook 160       |
|                              | Macintosh IISI              | PowerBook 165       |
| Macintosh Performa:<br>----- | Macintosh IIfx              | PowerBook 165c      |
|                              | Macintosh IIVI              | PowerBook 170       |
| Performa 200                 | Macintosh IIVx              | PowerBook 180       |

## System 7: Maximum Virtual Memory (8/96)

Revised: 8/8/96  
Security: Everyone

System 7: Maximum Virtual Memory (8/96)

Article Created: 7 March 1991  
Article Reviewed/Updated: 8 August 1996

TOPIC -----

How much Virtual Memory can I get?

DISCUSSION -----

The maximum amount of virtual memory available depends on the Macintosh model.

The Macintosh II, IIx, IIcx, IICi, IIsi, and IIfx models can address a maximum of 13MB of virtual memory. The maximum of 13MB assumes that the user has only a NuBus video card installed. Each additional NuBus card installed in your Macintosh will decrease your maximum amount of virtual memory by 1MB.

The Macintosh SE/30 can address a maximum of 13MB of virtual memory.

Additionally, the Macintosh IICi, IIsi, and IIfx models can operate in 32-bit addressing mode. When operated in 32-bit addressing mode, these Macintosh models can address a maximum of 1GB (one gigabyte, or 1,024MB) of virtual memory.

Note: the maximum amount of virtual memory available on your Macintosh computer is also limited by available space on your hard disk.

## System 7: 32-Bit Addressing

Revised: 12/20/93  
Security: Everyone

System 7: 32-Bit Addressing

Article Created: 7 March 1991  
Article Reviewed/Updated: 17 December 1993

TOPIC -----

1. What is 32-bit addressing?
2. How does it work?
3. Why do I get Type 1 errors?

DISCUSSION -----

1. What is 32-bit addressing?

-----  
32-bit addressing means that you can install and access more than 8MB of physical RAM in your Macintosh. This means you can work with very large data files, very large applications, or many applications concurrently. 32-bit addressing is most attractive to Macintosh users working with large memory-intensive problems. While virtually anyone can benefit from the large amount of memory offered by 32-bit addressing, it will immediately benefit database users, color-graphic users, CAD/CAM users, and programmers. While 32-bit addressing may seem to benefit a small percentage of Macintosh users today, users can expect to soon see powerful "general purpose" tools benefit from 32-bit addressing.

More technically speaking, 32-bit addressing lets most recent Macintosh models access the entire 1GB memory range of the 68030 microprocessor. The basic software and hardware of the Macintosh already support the 32-bit addressing model, but any Macintosh using System 6 is limited to using only 8MB of memory because 32-bit addressing was not yet fully implemented.

In System 7, 32-bit addressing is fully implemented allowing most Macintosh computers access to greater than 8MB of memory. This expanded memory is important for high-end users working with many applications, complex graphics documents, large databases, and so on.

The term "addressing" refers to the number of binary digits (bits) that

make up each memory address. Addressing directly determines the maximum amount of memory possibly available.

## 2. How does it work?

### ----- Binary numbers

To understand what happens with addressing, it is first necessary to understand what address bits are. The number system we're most accustomed to is the decimal system, otherwise known as the Base 10 system. In this system, all the numbers are relative to ten digits (0-9). When a number value exceeds the tenth digit, we add one to the value in the next column and start over in the first column. Hence, when 1 is added to the number 09 we get 10. When we add 1 to 099, we get 100, so forth and so on.

Base 10 relies on there being exactly ten unique values per digit. Base 10 is not the only number system around. In the early days of computers, it was realized that it is much simpler to build data storage device such as a vacuum tube or a transistor with two possible value states(0 or 1) than it was to build one with 10 possible values(0 through 9). Therefore, someone came up with the idea of defining information in Base 2 format.

With the Base 2 number system, instead of counting your digits 0,1,2,...,9 and then adding a one to the next column, you simply count your digits 0,1 and then add a one to the next column. Hence, in the binary system the number zero is represented by a 0, the number one by a 1 and the number two by a 10, so forth and so on.

Here is a short table of some more examples:

| Base 10 | Base 2 |
|---------|--------|
| -----   | -----  |
| 0       | 0000   |
| 1       | 0001   |
| 2       | 0010   |
| 3       | 0011   |
| 4       | 0100   |
| 5       | 0101   |
| 6       | 0110   |
| 7       | 0111   |
| 8       | 1000   |

If you expand this table out, you will see, the maximum number of values you can represent with 4 binary digits(bits) is 16, with 16 bits, 65,536, with 24 bits, 16,777,216 and with 32 bits, 4,294,967,296. This is identical to being able to represent 10,000 (0-9999) values with four decimal digits and 100,000,000 (0-99,999,999) values with 8 decimal digits.

### Macintosh address range

-----  
The original Macintoshes shipped with the 68000 microprocessor. While this CPU is capable of doing 32 bit operations, it has only 24 bit addressing

capability. Which limits a 68000 based computer to 16,777,216 bytes of address range. When the Macintosh II came out with the 68020 which has full 32 bit addressing capabilities, the possible address range was increased to 4,294,967,296 bytes.

Now you're probably wondering why you can only access 8MB in 24 bit mode. The truth is you can access 16mb, but only 8mb is available for user data. The other 8 is used for hardware vectors, NuBus slots, SCSI buffers etc.

#### The Problem

-----  
Since the 68000 is a true 32 bit processor, it stores 32 bits of information for each memory address, but since the 68000 physically only has 24 address lines, only the first 24 bits actually count. This of course means that 8 bits are wasted.

This is where creative programmers come in. Back when the Macintosh only had a 128k of RAM, the Operating System had to go to some extreme lengths to ensure that application have enough memory to run. The Macintosh Memory manager allows blocks of memory to move, and/or be purged if the System is having trouble fulfilling a memory request. The original designers of the Macintosh OS decided to use the last three of the unused bits in a 32 bit memory address to indicate whether a block of memory can move, be purged or if the block contains a resource item.

When System 7 was introduced, the Memory manager portion of the Macintosh Operating system was modified extensively to support full 32 bit addressing. The Memory Manager no longer stores the movable, purgeable, or resource flags in the last three bits of the memory block's address, instead, the Memory Manager stores this information elsewhere. The exact location of these flags is not documented, since an application should not attempt to manipulate these flags directly.

Setting these three magic bits are at the discretion of the programmer. The Macintosh Operating System provides the programmer with the appropriate routines to set these bits. The problem is that to set these three bits, the Operating System routines have to call other routines who have to call still others etc. The net result is that using the Operating System routines to set these bits is quite inefficient when it comes to speed. Therefore, prior the introduction of System 7, some creative programmers with a need for speed, took it upon themselves to set these bits in the memory block's addresses directly thereby bypassing the overhead associated with calling the Operating System routines. Of course, the problem with doing this is that System 7 no longer stores these three bits in the address of the block of memory. Another significant programming error involves the other 5 bits of the 32 bit address. Ordinarily, these bits should remain unused and therefore, insignificant. However, some programmers, having realized that 5 bits are wasted decided to use them for their own purposes, even though Apple Developer Technical Support began warning them against this practice a full three years prior to the introduction of System 7.

### 3. Why do I get Type 1 errors?

-----

The fundamental problem with setting the upper 8 bits of the address directly is that with System 7 all 32 bits of information are used for addressing. Changing the value of any of the 8 bits changes the address of the block of memory. When an application or an init tries to access the block of memory that now has an invalid address, the usual result is a Type 1 error. This occurs because the first 24 bits of an address are used to access memory locations between 0 and 16mb. The upper eight bits are used to access memory locations between 16mb and 4,096mb. Since most Macintoshes have less than 16mb of RAM, chances are this incorrect memory location is pointing to an address that does not physically exist, and this will yield a Type 1 (Bus Error).

In the event that the memory location does physically exist, then the application or init will then operate on whatever information it finds at the incorrect location. Depending on what the application or init is attempting to do, various errors may result.

System 7: How to Use 32-Bit Addressing (9/94)

Article Created: 7 March 1991  
Article Reviewed/Updated: 12 September 1994

TOPIC -----

How can I use 32-bit addressing and is it available on all Macintosh models?

DISCUSSION -----

To take advantage of 32-bit addressing you must be running System 7.0 or higher. Many Macintosh models can enable 32-bit addressing in the Memory control panel.

Older Macintosh II models will need the 32-Bit System Enabler or MODE32 from Connectix to provide the capabilities of 32-bit addressing. Models that require this utility are the Macintosh II, IIX, IICX, and SE/30. Other models, like the Plus, SE, and Classic can't use 32-bit addressing.

You would use 32-bit addressing if you have more than 8MB of physical RAM installed in your computer. Alternatively, you can use 32-bit addressing in conjunction with virtual memory to expand your memory to any arbitrary amount up to the available space on your hard disk. Remember, however, that Apple recommends the amount of virtual memory not exceed double the physical memory present in your Macintosh. Setting virtual memory higher causes significant performance degradation.

The Memory Control Panel lets you select between 24-bit operation and 32-bit (addressing) operation. Changes take effect when you restart. When you run in 32-bit mode, it's important that your applications be 32-bit-compatible. Most current releases of application software are compatible. Check with your software publishers for information about a specific product.

Follow these steps to run in 32-bit mode:

- 1) Open the Memory control panel.

2) Select 32-bit addressing.

3) Restart your computer to run in 32-bit mode.

System 7: Applications and 32-bit Addressing

=====

Article Created: 7 March 1991

### Article Change History

-----

08/21/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Will my applications work with 32-bit addressing?

### DISCUSSION -----

Most applications are 32-bit-compatible and should work when your Macintosh is running in 32-bit mode. In 24-bit (the default) mode, the computer can run both 32-bit compatible and non-32-bit compatible software.

Those high-end users who specify the 32-bit addressing capability (through the Memory Control Panel) should ensure that their software is 32-bit compatible. Most current releases of application software are 32-bit compatible, and those that aren't should have upgrades available before too long.

System 7: and AppleShare File Server (v 2.0.1)

=====

Article Created: 8 March 1991

### Article Change History

-----

09/15/92 - UPDATED  
• For AppleShare 3.0.

### TOPIC -----

Should I install System 7 on my AppleShare File Server (version 2.0.1)?

### DISCUSSION -----

No. Your AppleShare File Server (version 2.0.1) is ready to use as is with System 7 clients. If you want to install System 7 on your server, then upgrade to version 3.0 of AppleShare.

If your server is connected with EtherTalk, you may want to upgrade the EtherTalk driver for Phase 2.

Do not upgrade the System Software on your AppleShare File Server (version 2.0.1) to System 7 unless you are also upgrading to AppleShare 3.0.

### Article Change History

-----

09/15/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Can I attach a hard disk initialized under System 7 to my AppleShare 2.0.1 file server?

### DISCUSSION -----

Yes. You can take a hard disk that you have been using under System 7 and attach it to a Macintosh running AppleShare 2.0.x file server software. However, you must first rebuild its desktop, as follows:

- 1) Attach the hard drive to a Macintosh running System 6.
- 2) Restart the Macintosh.
- 3) Hold down the Command and Option keys while you restart.
- 4) The system will ask if you want to rebuild the desktop. Click OK.

Once the system completes its work, your desktop is rebuilt, and you can attach the hard drive to the AppleShare server.

Technical note: You need to rebuild the desktop because System 7 puts a desktop database on hard drives and this desktop database is not recognized by AppleShare 2.0. Rebuilding the desktop under System 6 creates the older-style desktop file.

## System 7: Compatibility with Third-Party Routers and Gateways

Revised: 8/8/94  
Security: Everyone

System 7: Compatibility with Third-Party Routers and Gateways

Article Created: 8 March 1991  
Article Reviewed/Updated: 8 August 1994

TOPIC -----

Do third-party routers and gateways work with System 7?

DISCUSSION -----

Yes. Most third-party routers and gateways don't actually run on a Macintosh computer, so the system software version is irrelevant. What is relevant is whether the router or gateway supports AppleTalk Phase 2. In this area, all major router and gateway vendors offer products that support phase 2.

A partial list of major vendors includes 3Com, Alisa Systems, Engage Communications, Cayman Systems, Information Presentation Technologies, Focus Enhancements, Inc., Pacer Software Inc., and Shiva Corporation.

## System 7: Setting Up an AppleShare 2.0 Print Server

Revised: 9/18/92  
Security: Everyone

System 7: Setting Up an AppleShare 2.0 Print Server

Article Created: 8 March 1991

### Article Change History

-----  
09/15/92 - REVISED  
• For technical accuracy.

### TOPIC -----

Should I install System 7 on my AppleShare Print Server?

### DISCUSSION -----

Not unless you have upgraded to AppleShare 3.0.

To use AppleShare PrintServer 2.0 with System 7 clients, you need to update only the LaserWriter drivers on the Print Server.

- 1) Quit the AppleShare PrintServer application and return to the Finder.
- 2) Insert System 7's "Printing" disk.
- 3) Drag two files from the "Printing" disk--LaserWriter and LaserPrep--into the System folder.
- 4) Double-click the AppleShare PrintServer application.
- 5) Optional: If your server also supports the AppleTalk ImageWriter II and/or the AppleTalk ImageWriter LQ, drag these drivers over too.

Your AppleShare PrintServer is now set up to work properly with all Macintosh computers using the 7.0 version of the LaserWriter drivers.

Note: Do not upgrade the system software on your 2.0.1 AppleShare

PrintServer to System 7. If you want System 7 on the server, you will need to upgrade to AppleShare 3.0.

## System 7: The Data Access Manager

Revised: 9/18/92  
Security: Everyone

System 7: The Data Access Manager

=====

Article Created: 8 March 1991

### Article Change History

-----

06/30/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

What is the Data Access Manager?

### DISCUSSION -----

The Data Access Manager is a Macintosh system interface. It gives Macintosh application developers the flexibility of using a single, unified API for accessing data from different data sources. These sources include local Macintosh databases, remote Macintosh database servers, and even other remote host database servers, like DEC VAXes and IBM mainframes.

The Data Access Language (DAL) client/server API is a database extension in System 7 which provides access to remote host database servers. Applications written to the Data Access Manager can transparently use DAL to access data from DAL servers on host computers across different networks. The Data Access Manager is included along with the DAL client software in System 7.0.

The Data Access Manager offers three benefits:

- Macintosh applications now have a standard way to access data, regardless of the location of the data or the storage mechanism.
- Transparent access to the DAL client/server protocol is a part of the Data Access Manager.
- The architecture of the Data Access Manager is tailored for future

extensibility.

The Data Access Manager provides two levels of interface for applications, a high-level interface and a low-level interface. The high-level interface is a standard way for all desktop applications, like a graphical charting package, to access data.

A new command has been added to the File menu: "Open Query". The end-user can pull down the File menu, select "Open Query", and choose a query like "Monthly Sales" to launch a request for data. This request returns the sales information for the month into an application, like a charting package.

The Data Access Manager's query builder makes it easier for in-house developers to create data-access pathways to different data sources. Thus, it delivers the flexibility to use such queries to create custom reports and presentations. The low-level interface is intended for in-house or custom developers who use tools like HyperCard and 4th Dimension to build highly-customized data-access interfaces. This low-level interface permits developers of data-intensive commercial applications, like statistical packages, to build sophisticated query interfaces for their desktop applications.

## System 7: Data Access Language (DAL)

Revised: 7/27/93  
Security: Everyone

System 7: Data Access Language (DAL)

Article Created: 8 March 1991  
Article Reviewed/Updated: 23 July 1993

TOPIC -----

What is Data Access Language (DAL)?

DISCUSSION -----

Data Access Language, formerly called CL/1, is Apple's client/server protocol for remote data access and is based on ANSI standard SQL (Structured Query Language). DAL is optimized to provide decision-support applications with uniform access to data, regardless of the different brands of databases, the different host platforms, or the different types of networks.

DAL is intended for Macintosh applications that need ad-hoc access to data from multiple data sources. While performance-oriented applications, like transaction-processing applications, can use DAL, such applications, especially in a single database-vendor environment, could be better served by the many solutions available from third-party Macintosh database and tool vendors like Informix, The Ask Group, Inc./Ingres Products, Oracle, Sybase, and others.

DAL uniquely addresses the needs of customers with databases from multiple database vendors. The DAL client software is included as a part of System 7.0 and can be transparently accessed by applications written to the Data Access Manager API. These applications can access data from DAL servers running on host computers, across all DAL-supported networks. Therefore, with the Data Access Manager and the included DAL client software in System 7, applications can "speak" in an identical fashion to many different types of host databases.

Apple Computer Inc. is currently delivering DAL servers through APDA for the following environments:

- VAX/VMS (for DEC Rdb, Informix, Ingres, Oracle, and Sybase)
- MVS/TSO (for IBM DB2)
- VM/CMS (for IBM SQL/DS)

DEC also provides DAL as a part of the DEC PathWORKS product.

Apple is also working with software and hardware vendors to extend DAL client and server support to other industry platforms.

## System 7: The Macintosh, DAL, and Database Development

Revised: 7/27/93  
Security: Everyone

System 7: The Macintosh, DAL, and Database Development

Article Created: 8 March 1991  
Article Reviewed/Updated: 23 July 1993

TOPIC -----

What's Apple's database story?

DISCUSSION -----

The Macintosh has always been the platform for unique and innovative applications--and this extends to the database world. Products like 4th Dimension (ACI), Omnis 5 (Blyth), Foxbase+/Mac (Microsoft Corp.) and Double Helix (Odesta) provide Macintosh users with state-of-the-art data management and application-development capability. In addition, all the major cross-platform, corporate-database, and application-tool vendors have also endorsed the Macintosh and delivered both client and server products, including ORACLE for Macintosh, ORACLE Server for A/UX (Oracle), Informix SE for A/UX (Informix), and Ingres Server for A/UX (The Ask Group, Inc./Ingres Products).

Apple intends to continue to provide all the elements needed to make the Macintosh a complete platform for stand-alone and client/server database applications. Toward this end, Apple has announced various products, targeted at making the Macintosh the ideal database client platform. The Data Access Manager and the Data Access Language (DAL) client software included with System 7.0 further reinforce this position

These two products mean that Macintosh application developers can write their applications once and use the same applications to transparently access data in local or remote locations. With this infrastructure in place, Apple is working closely with third parties to provide its customers and developers with the database tools needed to implement mission-critical applications. To complete the database story, Apple and third parties are working together to make the Macintosh an equally strong platform for server applications.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

### TOPIC -----

Will my locked, removable, System 7 volume mount under System 6?

### DISCUSSION -----

No. You must rebuild (or create) the desktop file on any cartridge not containing one from System 6 to bring it back into a System 6 environment. If this disk is locked or does not contain enough space for a resource desktop, System 6 won't mount the volume. You should unlock the volume to let a resource desktop be created.

A System 7 hard disk with not enough space could have the same problem and not mount under System 6.0. To work around this, remove some files under System 7 to let a resource desktop be created.

08/17/92 - REVIEWED

- For technical accuracy.

TOPIC -----

Can I start System 7 from a floppy disk?

DISCUSSION -----

System 7 will not fit on an 800K floppy. However, you can use the Installer to make a bootable 1.4MB floppy.

To create a bootable 1.4MB System 7 floppy, use the Customize option of the Installer to install the Minimum System for your Macintosh. This creates a bootable version that is very limited and contains minimal functionality for the Macintosh. Apple recommends that you not use this disk as your main system, but only as an emergency disk.

Bootable disks are also provided in both the System 7 800K and 1.4M disk suite on the "Disk Tools" disk. The 800K format contains a 6.0.X bootable system and the 1.4MB format contains a 7.0.X bootable system.

Custom installation lets you select the exact combination of system files, drivers, and other resources you want. You can use this process for initial installation, for updating to a new version of System software, for installing a single, special resource, or for saving space on your startup disk by eliminating software that isn't essential.

When you click "Customize" you have a choice of standard or minimal system files for each model of the Macintosh. Insert and select the 1.44MB floppy

where you want to install System 7, choose the option Minimal for your Macintosh, then click Install.

Security: Everyone

System 7: Automatic Placement of Files in System Folder

=====

Article Created: 8 March 1991

### Article Change History

-----

08/24/92 - EDITED  
• For clarity.

### TOPIC -----

I dropped a file on my System folder; where did it go?

### DISCUSSION -----

When you drop a file onto the System Folder, the system automatically places the file in the right place in the System Folder. As a result, you shouldn't have to worry about where different things go in your System Folder. After the System places items in their appropriate locations, a dialog box will appear with a report of which folder(s) the items were dropped into.

You must put the file onto the icon for the System Folder for this automatic placement to work. If you drop the file into the open window of the System Folder, the system will not automatically place the file in the appropriate location.

- The system puts fonts into the System file.
- Control Panels go into the Control Panels folder.
- System extensions (formerly called INITs) go into the Extensions folder.
- Desk Accessories go into the Apple Menu Items folder.

If you want to put a system extension, control panel, font, or other item in another location within the System Folder, open the System Folder and drag the items directly where you want them to be.

Security: Everyone

System 7: New Sound Capabilities

Article Created: 8 March 1991

### Article Change History

-----  
08/25/92 - UPDATED  
    • To include sound input capabilities.  
07/25/91 - REVISED

### TOPIC -----

What are the new sound capabilities in System 7?

### DISCUSSION -----

System 7 offers some exciting new sound capabilities that you will hear as software developers revise their applications for sound.

For the first time, a Macintosh with System 7 can play several sounds at once. For example, you could be playing a voice track and some other track at the same time. In addition, you can work on other things while the system plays a sound.

System 7 offers sound-input capabilities for the microphone included with recent Macintoshes. With sound-in, applications can start offering features like voice annotation of documents.

Finally, System 7 has built-in audio compression to save disk space, so you can have larger sounds than before.

Apple III: Specifications (Discontinued 9/85)

Article Created: 14 March 1991

### Video Display

Text and graphics may be displayed simultaneously. Using graphics commands you can display either of two screen buffers.

#### Graphics modes:

- 280 x 192, 16 colors (with some limitations)
- 280 x 192, monochromatic; -140 x 192, 16 colors
- 560 x 192, monochromatic
- All Apple II modes (in emulation)

#### Text modes:

- 80-column, 24-line monochromatic
- 40-column, 24-line, 16-color foreground and background
- 40-column, 24-line monochromatic

All text modes have a software-definable 128-character set (uppercase and lowercase) with normal or inverse display.

### Central Processing Unit (CPU)

The custom-designed microprocessor circuitry of the Apple III uses the 6502B as its major component. Other circuitry provides extended addressing capability, relocatable stack, zero page, and memory mapping.

- Type: 6502B
- Clock Speed: 1.4 MHz average; 1.8 MHz max
- Operations per Second (8-bit): up to 750,000
- Data Bus: two 8-bit formats, combined for extended addressing
- Address Bus: 19 bits
- Address Range: 262,144 bytes (256K)
- Registers:
  - Accumulator (A); Index Registers (X,Y); Stack Pointer (S); Program Counter (PC); Environmental Register (E); Bank (B); Zero Page (Z); Processor Status (P)

## Memory

-----

- 256K dynamic RAM
- 4K ROM (initialization and self-test diagnostics)

## SOS (Sophisticated Operating System)

-----

SOS handles all system I/O and can be configured to handle standard or custom I/O devices and peripherals by adding or deleting "device drivers." All languages and application programs access data through the SOS file system.

## Keyboard

-----

- 61 keys on main keyboard
- 13 keys on numeric keypad
- Full 128-Character, ASCII encoded
- All keys have automatic repeat
- Four directional-arrow keys with two-speed repeat
- Two user-definable Apple keys
- Seven other special keys: Shift, Control, Alpha Lock, Tab, Escape, Return, Enter.

## Storage Devices

-----

- One built-in 5.25-inch, floppy-disk drive, 140K (143,360 bytes) per diskette
- You can connect three additional drives by daisy-chain cable (total: 560K on-line storage)
- You can add up to four ProFile hard-disk drives (5MB each) with plug-in interface cards

## Video Output

-----

- RCA phono connector for NTSC monochromatic composite video
- DB-15 connector for:
  - NTSC-color composite video
  - NTSC monochromatic composite video
  - RGB color video
  - Composite sync signal
  - Power-supply voltages
- Color signals appear as 16-level grey scale on monochromatic displays

## Audio Output

-----

- Built-in two-inch speaker, miniature phono jack on back panel
- Driven by 6-bit D/A converter or fixed frequency "beep" generator

## Serial (Printer/Modem) Port

-----

- RS-232C compatible, DB-25 female connector
- Software-selectable baud rate and duplex mode

- You can use one port for the Silentype printer.

#### Expansion Ports

- Four 50-pin expansion slots (fully buffered, with interrupt and DMA priority structure)
- Joystick/Silentype Ports: Two DB-9 connectors

#### Languages Available

- Apple Business BASIC
- Apple III Pascal
- Apple III COBOL

#### Emulation Mode

This mode provides hardware emulation of 48K Apple II Plus. It can run most Apple II programs, with the exception of Pascal and FORTRAN, without modification.

#### Electrical Specifications

Plug the Apple III's power cord into a three-wire 110-120 VAC outlet. The Apple III meets the following agency regulations:

- UL 114, Office Appliances and Business Equipment
- CSA 22.2, No. 154-Data Processing Equipment

#### Physical Specifications

- Height: 4.8 in. (12.20 cm)
- Depth: 18.2 in. (46.22 cm)
- Width: 17.5 in. (44.45 cm)
- Weight: 26 lb. (11.8 kg)

## Apple TokenTalk NB Card: Specifications

Revised: 5/16/91  
Security: Everyone

Apple TokenTalk NB Card: Specifications

=====

Article Created: 14 March 1991  
Article Reviewed Only:  
Article Last Updated:

### Connectors

-----

- DB-9 connector for attaching to the IBM cabling system
- External adapter (available from other suppliers) for use with Type 3 cabling

### Interface

-----

NuBus plugs into any Macintosh II computer.

### Processor

-----

Motorola 68000 running at 10 MHz

### Memory

-----

512K of RAM

### Application Interface

-----

AppleTalk, Apple 3270 API, APPC

### Power Dissipation

-----

15 W

### Transmit/Receive Data Rate

-----

4 Mbit/sec, on-board transceiver

## Apple Writer: Specifications (Discontinued)

Revised: 9/13/93  
Security: Everyone

Apple Writer: Specifications (Discontinued)

=====

Article Created: 14 March 1991

### Format

-----

16-sector diskettes

### Language

-----

Written in machine language, usable with Integer BASIC or Applesoft

### Display

-----

- Up to 24 lines of 40 characters/spaces each
- Uppercase displayed in inverse video

### Storage

-----

- Up to 31,901 characters per file
- 95 pages of text per diskette

### Editing Functions

-----

- Cursor Control: Cursor can be moved up, down, left, or right one space at a time; up or down 12 lines at a time; or to the beginning or end of text.
- Free Memory shows amount of memory available.
- Disk Access to catalog or save files to diskette.
- Uppercase Conversion can change up to 15 lines of text into uppercase instantly.
- Insert/Save can insert a stored file into a new document or save a file segment to the diskette.
- Search and Replace can do automatic or manual search and replacement of user-specified strings, including single characters, words and phrases, parts of words and phrases, sentences, and so on up to a maximum of 76 characters each.
- Deletions deletes by character, word, or paragraph up to 256 characters.

- Move Block moves a block of data within a file.

#### Printing Functions

- Justify can specify centered, or fill-, right-, or left-justified lines of text.
- New Page specifies when a new page should be started.
- Margin Set sets top, bottom, left, and right margins.
- Line Spacing selects the number of spaces between lines.
- Paper provides for continuous fan-fold and single-sheet paper.

Note: Apple Writer does not provide tab, proportional spacing, or underscoring capabilities.

## AppleLine: Specifications (Discontinued)

Revised: 9/15/93  
Security: Everyone

AppleLine: Specifications (Discontinued)

=====

Article Created: 14 March 1991

### Electrical/Communications

-----

- Emulation: 3278 Model 2, requiring the use of VT100 emulation software
- Serial port: RS-232-C with autobaud feature
- Data format: serial asynchronous; 7- or 8-bit selectable
- Data rate: 45.5 to 19.2K baud
- Communications: Full-duplex interface
  - Category A device requiring type A terminal adapter and BNC coaxial connector
  - 15 ft. (5 m) maximum distance between AppleLine and Apple computer (when RS-232 cable is used)
  - 5000 ft (1500 m) maximum distance between AppleLine and 3274/76 controller
- Power supply: 120 VAC, wall-mounted transformer
- Temperature range: 50 to 104 degrees F (10 to 40 C)

### Mechanical

-----

- Width: 8.62 in. (21.91 cm)
- Height: 2.22 in. (5.64 cm)
- Depth: 12.7 in. (32.26 cm)
- Weight (including packing materials): 4 lb. (1.8 kg)
- Side panel: Off/On switch
- Rear panel: DB-25-pin connector, coaxial connector, and non-shorting power jack

Monochrome Monitor IIe: Specifications (Discontinued)

=====

Article Created: 15 March 1991

### Picture Tube

-----

12 in. (30.5 cm) diagonal, high-contrast, anti-glare, 90-degree diagonal deflection with green phosphor (EIA Type P31)

### Active Display Area

-----

215 mm horizontal by 160 mm vertical (remainder of area is used for border)

### Scanning

- 
- EIA stand: 525 lines
  - 30 frames; 60 fields/sec overscan

### Scan Rates

-----

Horizontal: 15.7 kHz  
Vertical: 59.9 Hz

### Input Signal

-----

Composite video, 1.0 (+-0.1), volts peak-to-peak, negative sync

### Video Bandwidth

-----

Less than 3 dB down at 10 MHz

### Display Capability

-----

With Apple IIe: 560 dots horizontally by 192 dots vertically

### Text Display

-----

Up to 80 columns by 25 lines

Horizontal Linearity

-----

Less than 10%

Vertical Linearity

-----

Less than 7%

Video Input Connector

-----

RCA-style phono jack (75 ohm)

Macintosh II Portrait Display Card: Specs (Discontinued)

=====

Article Created: 15 March 1991

### Interface

-----

NuBus: plugs into any Macintosh II slot

### Output Signals

-----

- Modes: RGB (analog) and gray scale
- Video: RS-343 standard and RS-170 timing-standard interlaced video
- Sync: separate horizontal and vertical sync, negative-going, TTL

### Connector

-----

D-style with three internal coaxial connectors and 10 pins

### Display Modes

-----

- 1 or 2 bits per pixel (2 or 4 gray levels)
- Upgradable to 4 bits per pixel (16 gray levels) with the Macintosh II Video Card Expansion Kit

### Raster Rates

-----

- Vertical: 75 Hz
- Horizontal: 68.9 kHz

### Power Consumption

-----

10 W

## Apple IIc Memory Expansion Card: Specifications (Discontinued)

Revised: 9/13/93  
Security: Everyone

Apple IIc Memory Expansion Card: Specifications (Discontinued)

=====

Article Created: 15 March 1991

### Electrical

-----

- Voltage requirement: 4.75 to 5.25 VDC power consumption
- Operating: Not more than 135 mA in a 1MB configuration

### Environmental

-----

Ambient temperature: 50 to 104 degrees F (10 to 40 C)  
Relative humidity: 0% to 95% (noncondensing)

### Miscellaneous

-----

Operating system compatibility: ProDOS, DOS 3.3, or Pascal 1.3 (earlier versions of Pascal can be upgraded to Version 1.3). Apple DOS 3.3 programs cannot be booted from the Memory Expansion Card.

Apple III OEM Prototyping Card: Specifications (Discontinued)

=====

Article Created: 15 March 1991

Circuit Development Area (A)

-----

- 5.40-inch by 3.70-inch space
- 0.10-inch hole spacing
- Accepts up to 42 14-pin; 36 16-pin; 24 24-pin; or 12 40-pin DIP packages or combinations thereof

Input Buffering Area (B)

-----

This area is for installation of RFI isolation circuitry.

- Connector Interface Areas:
  - Area C: for up to 67-pin, "D"-type connectors
  - Area D: for up to 50-pin, ribbon-cable connectors
- Additional Board Areas:
  - SPST switch position (E)
  - RF Shield (supplied) connection points (F)
  - 50-pin, gold-plated edge connector

## LANSTAR AppleTalk Network: Specifications (Discontinued)

Revised: 9/21/93  
Security: Everyone

LANSTAR AppleTalk Network: Specifications (Discontinued)

=====

Article Created: 15 March 1991

### Network

-----

- Topology: Star
- Wiring: Unshielded, twisted-pair (22- to 26-gauge wire)
- Signaling speed: 2.56 Mbps to a 40 Mbps backbone
- Maximum length: 2000 feet to each point of the star (workstations can be up to 4000 feet apart)
- Node identification: Self-configuring (except for the LANSTAR AppleTalk Bridge)
- Applications supported: all Macintosh II, AppleTalk applications
- Polling mechanism: high speed perfect-scheduling
- Backbone: Shared 40Mbps; optional redundant backbone

### LANSTAR Interface Card for the Macintosh II

-----

- LANSTAR protocol support for the full AppleTalk protocol stack, including ATP, NBP, ZIP, EP, PAP, and RTM
- ALAP, modified to support twisted-pair media
- DDP, extended to support the LANSTAR AppleTalk Bridge Memory: 2K of RAM
- Interfaces: 2 RJ11 jacks (one is to pass through the telephone)
- Configuration: NuBus
- Maximum power consumption: 4.8 W
- Size: 4 in. (10.2 cm) high by 11.75 in. (29.9 cm) long
- Operating temperature: 50 to 95 degrees F (10 to 35 C)

### Meridian LANSTAR System (Model PTE-S)

-----

#### Electrical Requirements

-----

- Line voltage: 92 to 130 VAC (184 to 260 VAC optional)
- Frequency: 47 to 440 Hz
- Power consumption: 300 W maximum for each power supply; 410 W maximum on a fully-loaded system

#### Environmental Requirements

-----

- Operating temperature: 50 to 99 degrees F (10 to 37 C)
- Relative humidity: 5% to 95% noncondensing
- Regulatory approvals: UL; FCC Part 15, Class B

#### Size and Weight

-----

- Height: 29.5 in. (74.9 cm)
- Width: 23.3 in. (59.2 cm)
- Depth: 25.5 in. (64.8 cm)
- Weight: 215 lb. (97.5 kg) with one power supply; 242 lb. (109.8 kg) with two

#### LANSTAR AppleTalk Diagnostic Tool

-----

Driver interface: NuBus

Protocol interface: DDP

Stand-alone application; standard Macintosh user-interface Loop back, echo, local-node test, and remote-node test

#### AppleTalk Protocol Support

-----

- Driver interface: AAGA
- Configurations
  - Workstation, running in background
  - Network server, with AppleShare and/or LaserShare

Article Created: 15 March 1991

### Marking Engine

-----

Canon LBP-SX laser xerographic

### Processor

-----

Motorola 68020 (16.67 MHz clock speed)

### Memory

-----

1MB ROM; 2MB RAM

### Interfaces

-----

SCSI, AppleTalk, Apple Desktop Bus (for future expansion), and RS-232-C ports

### Expansion Capabilities

- 
- ROM expansion via font expansion slot
  - RAM expansion up to 12MB
  - External SCSI port for hard disk font storage
  - Apple Desktop Bus for future expansion

### Print Quality

-----

All text and graphics printed at 300 by 300 dots per inch, full page

### Built-in Font Families

-----

Times, Helvetica, Courier, Symbol, ITC Avant Garde Gothic, ITC Bookman, New Century Schoolbook, Helvetica Narrow, Palatino, ITC Zapf Chancery, and ITC Zapf Dingbats

## Speed

-----  
8 pages per minute maximum throughput (actual speed depends on images printed)

## Printing Protocols

- 
- PostScript
  - a subset of the Diablo 630 command set
  - Hewlett-Packard LaserJet Plus emulation

## Print Materials

-----  
Letter, legal, A4, and B5 sizes, using 16- to 20-lb. single-sheet photocopy bond, 8- to 34-lb. letterhead and colored stock, or transparency overhead film. Envelopes, labels, and paper (up to 36-lb.) supported via manual feed. Envelopes also supported via optional envelope tray.

## Print Capacities

- 
- Paper cassettes hold 200 sheets of 20-lb paper.
  - Envelope cassette holds 15 envelopes.

## Printable Surface

- 
- Letter size: 8.0 by 10.5 in.
  - legal: 8.0 by 13.0 in.
  - A4: 7.41 by 10.86 in.
  - B5: 7.69 by 10.16 in.
- (Actual printable area may vary depending on application.)

## Size and Weight

- 
- Height: 8.6 in. (21.8 cm)
  - Width: 20 in. (50.8 cm)
  - Width: with letter tray attached, 26.4 in. (67.1 cm)
  - Depth: 18.5 in. (47 cm)
  - Weight: 45 lb. (20.25 kg)

## Operating Environment

- 
- Temperature: 50 to 90 degrees F (10 to 32 C)
  - Humidity: 20% to 80%

## Power Requirements

Carrier-sense, multiple-access with collision avoidance (CSMA/CA)

## • QUESTIONS & ANSWERS

Q) I've been experimenting with LocalTalk networking running inside metal conduit. My tests show that the LocalTalk network would not work at 300 feet within this metal conduit. The wire was Belden shielded twisted-pair apparently meeting Apple specifications.

1) Is Apple LocalTalk affected by running through metal conduit?

2) If diameter is important, how would 2-inch conduit affect it?

3) Does Apple publish a network installation/design guide with this issue in mind?

A) From the sounds of it, the conduit is affecting the impedance/capacitance of the LocalTalk cabling. Also, having the cable lying on the metal conduit could affect the impedance/capacitance. Also, consider these questions: Is the conduit grounded? Is it grounded to the same source as the shield of the LocalTalk cable?

The specification for LocalTalk (included below) only address what you need for the cable. If an external source changes any of those parameters (in this case, the impedance/ capacitance is most likely being affected), then the cable would not meet the required specifications. Apple does not test LocalTalk cabling under multiple conditions (in conduit, by large grounds, by power sources), because it would be difficult--if not impossible--to anticipate all the different possible environmental conditions that could affect a cable.

Other than "Inside AppleTalk," Apple does not publish any information about LocalTalk cables. We did notice that the cabling specification 062-0190-B is not included in the second version of "Inside AppleTalk."

After you verify that you are using the proper cable and connectors, see if the cable will work over the same distance when it is outside the conductor. If there are fire codes that require conduit installation, would Teflon cable satisfy the requirement?

Here are some basic specs:

- Cable Specification (sheet 5 of 10, drawing number 062-0190-B)
- Conductors: 22 AWG stranded 17 ohm per 300 meters
- Shield: 85% coverage braid
- Impedance: 78 ohm
- Capacitance: 68 pF per meter
- Rise time: 175 ns 0 to 50% at 300 meters
- Diameter: 4.7 mm (0.185 inches) maximum

Q) Why does Apple use a shielded pair wire (LocalTalk) when other manufacturers, such as Farallon, can perform the same function without shielding?

A) During the evolution of AppleTalk, a major concern for Engineering was the need to meet FCC Class B specifications for radiated emissions. To meet this specification using RS-422-type signalling, it is necessary to use shielded cable. This shielded cable also reduced EMI with the signal on the cable itself (incoming interference). This was all done in the interest of both the FCC specification and the need for data integrity in a variety of network installation locations. The ground (shield) prevents excessive RFI, while a resistor/capacitor combination reduces ground currents while offering a low-impedance path for high-frequency noise, further reducing EMI/RFI. Telephone wiring is suitable for use in normal environments, but in some cases, network performance suffers because of the lack of shielding. There have been instances where electrical interference has compromised the integrity of data on PhoneNET.

Q) With respect to the first question, why is the LocalTalk network length limited to 1000 feet?

A) The 32-node/1000-foot limit is a recommendation. It is specific to LocalTalk networks using this cabling scheme. The considerations for this limit are the average traffic generated by these nodes and the physical transmission limitations of LocalTalk. With 32 LocalTalk Connection Modules attached to a LocalTalk network, there is a very specific drop in the signal level on the network based on the characteristic impedance of the cable, the impedance of the secondary of the transformer, and the distance over which this signal must travel. The recommended limits are based on this maximum signal level drop over this distance with this number of nodes. More distance and/or more nodes could reduce the network signal below the acceptable data reliability limits, as well as the acceptance range of the receiver chips in the system.

From a traffic standpoint, only active nodes have an effect on the performance. However, both active and nonactive workstations affect the

electrical characteristics of the network because each LocalTalk connector box (transformer-isolated) puts another load on the network, regardless of whether the workstation is on.

- Q) What is the impedance of the LocalTalk cable? (Termination is documented in "Inside AppleTalk" as 100-ohm resistor, yet available AppleLink information seems to indicate 78 ohms is the impedance of the cable. Isn't the terminator supposed to match the cable for minimal signal reflection?)
- A) The impedance of the LocalTalk cable is 78 ohms, and the termination resistor is 100 ohms. To quote "Inside AppleTalk," "A 100-ohm resistor is used, even though the characteristic impedance of the line is 78 ohms, because it gives adequate termination and minimizes resistive losses." Our interpretation of this statement is: If there is a 1:1 impedance match across the transformer, there will be maximum signal transfer through the transformer, which would reduce the signal level on the network side of the transformer. If there is too great a difference in the values of the terminator and the cable, once again there will be signal losses--this time on the node side of the transformer because of the mismatch. By compromising on 100 ohms, losses from perfect impedance matching and losses due to gross mismatch are minimized.

Macintosh IIX: Specifications (Discontinued 10/90)

Article Created: 15 March 1991  
Article Reviewed/Updated: 20 July 1992

TOPIC -----

This article provides technical specifications for the Macintosh IIX computer.

DISCUSSION -----

### PROCESSOR

- 68030; 32-bit internal
- Harvard architecture
- 15.667 MHz clock speed
- 256-byte instruction and data caches

### COPROCESSOR

- 68882 floating-point coprocessor (IEEE standard: 80-bit precision)
- 15.667-MHz clock speed

### INTERFACES

- Six NuBus internal slots support full 32-bit address and data buses.
- Two mini-8 serial (RS-232/ RS-422) ports
- Two Apple Desktop Bus ports allow daisy-chaining of multiple peripheral devices with a SCSI interface: uses a 50-pin connector (internal) and a DB-25 connector (external)
- Sound jack for stereo output

### MOUSE

- Mechanical tracking: optical shaft encoding at 3.94+/-0.39 pulses per mm (100 +/-10 pulses/in.) of travel

### SOUND GENERATOR

- Apple's custom digital-sound chip provides 8-bit stereo sampling at 44.1 KHz, and includes four-voice, wave-table synthesis. Capable of driving stereo headphones or other stereo equipment through the sound jack.

ELECTRICAL REQUIREMENTS

- Line voltage: 100 to 240 VAC, automatically configured
- Frequency: 48 to 62 Hz
- Maximum power: 230 W, not including monitor power

SIZE AND WEIGHT

- MAIN UNIT
  - Height: 5.5 in. (14.0 cm)
  - Width: 18.7 in. (47.4 cm)
  - Depth: 14.4 in. (36.5 cm)
  - Weight: 24 lb. (10.9 kg, not including hard disk drive)
- MOUSE
  - Height: 1.1 in. (2.8 cm)
  - Width: 2.1 in. (5.3 cm)
  - Depth: 3.8 in. (9.7 cm)
  - Weight: 6 oz. (17 kg)

## Macintosh Internal 800K Disk Drive: Specs (Discontinued)

Revised: 9/27/93  
Security: Everyone

Macintosh Internal 800K Disk Drive: Specs (Discontinued)

=====

Article Created: 18 March 1991

### Recording Media

-----

- Disk diameter: 3.5 in.
- Recording surfaces: 2
- Tracks per inch: 80

### Capacity

-----

- Formatted data capacity: 800K (use only certified, double-sided media in Apple 3.5 Drive)
- Unformatted data capacity: 1246K

### Drive Characteristics

-----

- Seek time (track to track): 6 ms maximum
- Settle time: 30 ms maximum
- Drive startup time: 600 ms maximum

### Head Position Accuracy

-----

+0.035 mm

### Interface

-----

Direct connection to the Macintosh II via the SCSI 50-pin connector

### Electrical Requirements

-----

+12 volts

-----

- Standby: 10 microamps
- Typical: 120 mA
- Peak: 600 mA (during eject only: 2-sec. maximum duration)

+5 volts

-----

- Standby: 10 mA
- Typical: 360 mA

#### Environmental Requirements

-----

- Operating temperature: 40 to 122 degrees F (5 to 50 C)
- Storage temperature: -40 to 140 degrees F (-40 to 60 C) (no condensation)
- Relative humidity: 5% to 90% with maximum wet bulb temperature of 85 F (29 C) and no condensation

#### Size

----

- Height: 2.01 in. (51 mm)
- Width: 4.72 in. (120 mm)
- Depth: 7.87 in. (200 mm)

MacX25 supports the following:

- CCITT 1980 Compatible Mode
- CCITT 1984 Compatible Mode
- Packet Assembler/Disassembler (X.3, X.28, X.29)
- Operation as a DTE
- Operation as a DCE
- Virtual Circuits: 64 maximum
- Single link for each Apple Serial NB Card
- Multiple cards for each Macintosh II
- Operation at up to 19.2Kbps with RS-232C
- Operation at up to 64Kbps with V.35
- Multiple servers for each AppleTalk network system

MacX25 does not support the following:

- Permanent Virtual Circuits
- X.32 switched circuit operation

## Apple Daisy Wheel Cut-Sheet Feeder: Specs (8/94)

Revised: 8/31/94  
Security: Everyone

Apple Daisy Wheel Cut-Sheet Feeder: Specs (8/94)

Article Created: 18 March 1991  
Article Reviewed/Updated: 31 August 1994

TOPIC -----

This article describes the features and functions of the cut-sheet feeder on the Apple Daisy Wheel Printer. This printer has been discontinued and is no longer available.

DISCUSSION -----

Print Registration

-----  
The Apple Daisy Wheel Printer feeds paper, so that printing starts 0.15 inches from the top edge of the paper. Control of the bottom edge is a function of the printer and is dictated by program commands. Cut-sheet horizontal and vertical registration fall within the following accuracy requirements from page to page:

| Frequency (% of sheets being fed) | Tolerance (maximum deviation allowed within volume of sheets fed) |
|-----------------------------------|-------------------------------------------------------------------|
| 66%                               | +/- .030 inches (+/- .076 cm)                                     |
| 95%                               | +/- .060 inches (+/- .153 cm)                                     |

Skew

-----  
Operating on a properly adjusted Apple Daisy Wheel Printer, the feeder does not skew cut sheets (measured over the width of an 8-inch form) more than the following:

| Frequency (% of sheets being fed) | Tolerance (maximum deviation allowed within volume of sheets fed) |
|-----------------------------------|-------------------------------------------------------------------|
| 66%                               | +/- .030 inches (+/- .076 cm)                                     |
| 95%                               | +/- .060 inches (+/- .153 cm)                                     |

## Paper-Handling Capability

-----

Cut sheets are stacked into an adjustable paper hopper, having the following specifications:

- The paper hopper has a cut-sheet supply capacity equivalent to 200 sheets of 20 lb. paper.
- The paper stacker holds the same supply capacity as the paper hopper (200 sheets).
- You can reverse the paper feed up to one inch for subscript and superscript application.
- The number of operator interventions does not exceed one per 1000 sheets when using typical 20 lb. office paper.
- The sheet cycle time, from the ejection of a printed sheet to the feeding of a new one, is 6 seconds (approximate average time with a maximum of 12 seconds).
- The Form Feed switch on the front panel of the Daisy Wheel Printer initiates the feed cycle.

## Paper Specifications

- 
- Cut-Sheet Dimensions:  
Width: 8 inches (20.32 cm) to 12 inches (30.8 cm)  
Length: 8 inches (20.32 cm) to 14 inches (35.56 cm)
  - Cut-Sheet Weights:  
16 lb. (6.02 g/m<sup>2</sup>) to 24 lb. (9.2 g/m<sup>2</sup>)

Cut sheets include bond or equivalent weights of other types of cut sheets, like xerographic, mimeographic, offset, or text.

## Paper Surface Texture

-----

The recommended uncoated paper finishes are listed below:

|        |         |         |
|--------|---------|---------|
| Laid   | Vellum  | Antique |
| Cockle | English | Woven   |
| Policy | Linen   | Smooth  |

## Indicators

-----

The Feeder has no operator controls or visual indicators. It is platen driven. The only electrical interface to the printer is the paper-out sensor. The only error conditions possible are those initiated by the paper-out sensor, when the feeder is connected to the Apple Daisy Wheel Printer.

## X Windows System Version 11r3: Specifications

Revised: 9/18/92  
Security: Everyone

X Windows System Version 11r3: Specifications

Article Created: 18 March 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

X Windows System Version 11r3: Specifications

### DISCUSSION -----

#### Server

- 
- Network transparent
  - Supports multiple monitors connected to a single Workstation running A/UX Version 1.1 or later
  - Color support (with A/UX Version 1.1 or later)

#### Window Manager

- 
- Window decoration similar to the Macintosh environment
  - User control of screen configuration and customization
  - Customized to use Apple Desktop Bus (ADB) mouse and all ADB keyboards
  - Support for "backing store" and "save under," features that improve window system performance
  - Ability to manage multiple screens (using twm) from a single window manager process

#### Applications

- 
- Mouse-based screen editor (xedit)

- Calculator (xcalc)
- CPU Performance meter (xload)
- Clock (xclock)
- Bit-mapped, image-manipulation utilities, including conversion from screen image to PostScript format (bitmap, xdpr, xwd, xwud, xpr)
- Terminal emulator with DEC VTIO2 and Tektronix 4014 compatibility (xterm)
- Font displayer (xfd)

#### Libraries in C

- Complete applications development toolkit (X Toolkit intrinsics and Xaw Athen widget set)
- Graphics library (.Xlib)
- Include files

#### Configuration Required

- X for A/UX requires a Berkeley Networking Services or Sun Microsystems' Network File System. (NFS) environment.
- The simultaneous display of X and Macintosh Toolbox applications is not supported in this release.

Forms Creation Software: High-End Products

=====  
Article Created: 14 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I want to create high-end forms. Claris' SmartForm is not powerful enough, nor does it have many of the features that a dedicated, high-end, forms processing and creation system has.

Are you aware of any high-end products for the Macintosh?

DISCUSSION -----

Below are the names of three forms creation and management software publishers. Feature sets vary across the three. Each is strong in some areas and weak in others when compared to SmartForm from Claris. Apple is currently evaluating forms software for its own use. The project leader is very excited about features of packages not yet on the market. Great advances are expected in the next six months.

Here are the three packages and their publishers:

- Informed Designer from Informed Manager
- if/x: series from Softview
- True Forms from Adobe Systems, Inc.

For contact information, search the Technical Info library under the name of the publisher.

AppleShare PC 2.0: Using Expanded or Extended Memory

=====

Article Created: 14 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is it possible to load AppleShare PC 2.0 into either extended or expanded memory?

DISCUSSION -----

Yes, it is possible to load parts of AppleShare PC into extended memory (XMS) or expanded memory (EMS, EEMS, etc.) There is no real feature built into AppleShare PC to allow this, but a number of utilities exist that can manage memory and load programs and drivers into this alternate memory.

We have not done a great deal of testing with this, and, of course, third-party utilities that do this can't be treated as Apple-supported solutions. However, we have used one product (QEMM-386) to load a great deal of AppleShare PC 2.0.1 into extended memory on an IBM model 70 and it seems to work fine.

The process of determining what can and cannot be loaded into extended memory takes trial-and-error experimentation and can be rather complex. The variables involved include the processor capabilities of your computer, the capabilities of your memory-manager software, the number and type of programs to be loaded "high", and the type and amount of hardware that also needs use of this high memory range. This process is usually documented with the memory-manager software and differs enough between programs to be beyond the scope of this response. If you provide a very detailed description of specific PC installation, we may be able to provide more assistance.

For information on the QEMM-386 package, please contact the manufacturer, Quarterdeck Office Systems. For contact information, search the Technical

Info library under "Quarterdeck".

Note: At the time we tested it, QEMM-386 v5.1 was the one third-party memory manager available that was a compatible substitute for the Windows 3.0 HIMEM.SYS memory manager. There are now several other utilities, some commercial, some user-supported, advertising this ability. We have not tried any of these and probably won't unless a specific case needs attention.

## DAL: DB2 Data Updates Concerns (11/94)

Revised: 11/7/94  
Security: Everyone

DAL: DB2 Data Updates Concerns (11/94)

=====

Article Created: 14 February 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

We have developed the first phase of an enterprise-wide DSS system using DAL up to a DB/2 database. We need to query information and do real-time updates to the database.

From the query standpoint, everything works fine, but I have some concerns regarding updating the host database. Overall, we want to set up standards and procedures for updating DB/2 data from Macintoshes. Dynamic SQL gives us the capability to update the host, but MIS may not allow its use, due to backup, recovery, security, and other control issues. As alternatives to dynamic SQL, we could use batch mode on the host or COBOL to do the updates.

This is more of an organizational issue than a strict technical problem. Has anyone else faced the same issues, developed guidelines, and so on?

DISCUSSION -----

The fact that DAL uses dynamic, not static, SQL is not really the issue. You need to establish security by user or user group regardless of the kind of SQL used to access the tables.

The problems and concerns with backup and recovery are a function of the DB2 design and would exist if you used static SQL and CICS to do transaction updates. If you want neat backup points (for possible recovery later), you will have to do your updates in batch programs with quiesce points before and after. We are not aware of any guidelines established to address this issue.

## Macintosh IIsi and Display Card 8•24 GC: Compatibility Update

Revised: 7/16/92  
Security: Everyone

Macintosh IIsi and Display Card 8•24 GC: Compatibility Update

=====

Article Created: 14 February 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated:

TOPIC -----

What recommendations can you make regarding 8•24 GC card and the Macintosh IIsi?

DISCUSSION -----

The Macintosh Display Cards 4•8, 8•24, and 8•24 GC can be used in any NuBus-capable Macintosh. This includes the Macintosh II, Macintosh IICx, Macintosh IIX, Macintosh IIfx, Macintosh IICI, Macintosh IIsi with NuBus adapter card, and the Macintosh Quadra computers.

There have never been any concerns regarding the Display Cards 4•8 and 8•24 and the Macintosh IIsi. These have been and continue to be recommended configurations.

The Display Card 8•24 GC takes slightly more power, due to the processor and on-board memory, than the NuBus power specification of 15 watts. Because Apple had not completed initial testing of the Macintosh IIsi and Display Card 8•24 GC combination in October 1990, we were not able to initially recommend the combination.

We have now completed initial tests and can now recommend the Macintosh IIsi and Macintosh Display Card 8•24 GC combination in normal operating environments, meeting Apple's high reliability requirements.

Apple is continuing testing for elevated temperature environments. We will publish results of these tests as they become available. Until then, we do not recommend the combination of Macintosh IIsi and Macintosh Display Card 8•24 GC in environments where the temperature is expected to regularly exceed 32 C or 90 F. But we can recommend the combination for

normal environments.

With regard to third-party cards, we have found the vast majority to be completely compatible and to work reliably with the Macintosh IIsi. In those few instances where the power specification exceeds the NuBus specification, or if you have any questions or concerns about a specific product, contact the vendor. In Apple's case, we can now recommend all of our displays cards across the line of NuBus-capable Macintoshes.

## Display PostScript Options

Revised: 6/15/92  
Security: Everyone

Display PostScript Options

=====

Article Created: 14 February 1991  
Article Last Reviewed: 22 May 1992  
Article Last Updated: 22 May 1992

TOPIC -----

Is there any third-party hardware that uses Display PostScript to draw the image on a Macintosh screen?

If there is no hardware, do you know of a software PostScript interpreter to preview PostScript files on a Macintosh screen?

DISCUSSION -----

Display PostScript (licensed by Adobe) lets a PostScript procedure render graphics on a bit-map screen (in the same manner that a LaserWriter with its built-in PostScript lets a PostScript procedure render graphics on a sheet of paper).

Apple displays its graphics via QuickDraw instead of PostScript. Apple has no plans to display graphics based on PostScript language routines for many reasons. Providing this capability would likely require a rewrite of the Macintosh operating system.

If you are running A/UX, a PostScript user interface called NeWS may be used. A NeWS application is a collection of PostScript procedures that are sent to a NeWS server (perhaps remotely via a network connection). The server interprets the PostScript procedures and renders graphics in a window on the display's bit-map screen.

Macintosh print drivers let you view PostScript commands for editing purposes. If running System 6, press and hold the Command and "F" keys after selecting OK from the print dialog box. You'll see the message "Creating PostScript File." The file is named PostScript0, PostScript1, and so on - a standard text file that can be opened by most word processing and text editing programs. System 7

## ..TIL07005-Display\_PostScript\_Options.pdf

print drivers give you the option to change the print-job destination from the printer to disk. Merely check the appropriate destination in the print dialog.

It is possible to display an EPS (Encapsulated PostScript) file with many Macintosh applications, including Adobe Illustrator.

To display full PostScript files under the Macintosh OS, use an application like LaserTalk from Emerald City Software or PostShow from Lincoln & Co.

Search on company names for more information about third party products.

## HyperCard: Dial Sounds Different with System 6.0.5

Revised: 5/28/91  
Security: Everyone

HyperCard: Dial Sounds Different with System 6.0.5

=====

Article Created: 14 February 1991  
Article Last Reviewed: 4 June 1992  
Article Last Updated:

TOPIC -----

I have a new Macintosh LC, and a HyperCard note stack I've used for the past six months, which includes phone dialing routines. The dialer, which I've used by holding my handset to the speaker of a Macintosh IIX, no longer works. Tones are generated, but regardless of the distance between the Macintosh speaker and phone mouthpiece, they don't trigger the phone system. I've done some audio comparison tests, and it sounds as if the LC's tone generator is inaccurate, perhaps as much as a quarter-tone high.

DISCUSSION -----

As a result of changes in the Macintosh OS, support for DTMF tones is no longer available. HyperCard 2.0 uses digitized sounds with the Dial command. HyperCard 1.2.x will have difficulty producing the exact tones required to trigger the telephone system. Upgrading to HyperCard 2.0 should solve the problem.

You may want to consider the following:

- Try dialing with pauses between the tones. Commas in the string cause a one-second delay.
- A direct connection to the Macintosh results in higher fidelity and may trigger the phone system. The Macintosh sound circuitry is capable of producing much higher-quality sound than the speaker can pass. HyperDialer connects directly to the sound port and eliminates both our speaker and the telephone microphone.

## MacDFT Group 1: Timer and Performance over Token Ring

Revised: 5/28/91  
Security: Everyone

MacDFT Group 1: Timer and Performance over Token Ring

=====

Article Created: 14 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What happens when you change the Group 1 timer values on the Token Ring card? People here are complaining about the speed of MacDFT compared to the PS/2's that they had connected on the network. Would changing the values have any effect on the response time of MacDFT over Token Ring?

DISCUSSION -----

We don't recommend changing the Response and Acknowledge timers, unless you really know what you are doing. You can experiment with the Inactivity Timer, if you often get timeouts from the hosts. While selecting the MacDFT Config CDEV, pressing Command-T brings up the Group 1 Timers window with three timers. Only experiment with the Inactivity Timer, which is the bottom value. We don't expect changing these values would increase the performance of MacDFT.

The performance differences between the machines is not due to the block or even packet size (if both systems are on Token Ring), but is most likely due to MacDFT's intrinsic program speed. However, if the PS/2 is a LU and is "directly" connected to the controller, and, if the Macintosh is a PU having to go through a gateway, there can be substantial performance differences. Or if the PS/2 is on Token Ring, and the Macintosh is on coax, the PS/2 will be faster. But again, if everything else is equal, the Macintosh will still be slower.

In file transfer for example, under TSO when you transfer a file you allocate space in blocks, tracks, or cylinders by specifying BLKS, TRKS, or CYLS. Under CMS this is done automatically, depending on the file type you select, and can't be changed by the client. And even under TSO when you allocate the space, this doesn't influence perceptibly the throughput

performance.

Data is sent one buffer-full at a time, and the buffer size is set to be the screen size. So, if your terminal is configured to have a 80\*24 screen, during file transfer approximately 1920 bytes will be transferred at a time.

## Internet Router and Novell Token Ring VAP Problem

Revised: 12/10/92  
Security: Everyone

Internet Router and Novell Token Ring VAP Problem

Article Created: 15 February 1991

### Article Change History

12/9/92 - RETITLED

- To more accurately describe the article.

### TOPIC

I have been having problems with what looks like the Novell Token Ring VAP and the Apple Internet Router. The following is a description of the problem, the observations of the packet traffic by an engineer from Novell, and myself, with a shot at a conclusion. I know that the description of the packet traffic is meaningless without the actual trace data in front of you, but sending the trace data was impractical due to size (5MB). If you are interested in looking at the collected data, I can get it for you.

If there are known problems with the Internet Router that manifest themselves by the following description, I need to know as soon as possible.

### Observations: The Router Problem

Our company is seeing a problem where our 286 server drops connections. Our printers fade in and out of the Chooser. Our mail servers appear and disappear. Our network is nearly unusable. In the office we visited, there is a main token ring with four routers. Two of those routers connect the main ring to smaller rings that contain users. One of those routers connects to a LocalTalk segment. The other router routes to an Ethernet that passes back to the company's enterprise-wide net, and contains some large servers.

In general, we are worried about users on the two smaller rings and the LocalTalk segment talking to servers on the main ring. There are no

"users" on the main ring, just routers and servers. The two servers involved are called "who" and "who2". All of the routers involved are Apple Internet Routers, running on some fast II-class Macintoshes.

To look at this problem we attached two LANalyzers to the network, one (LA1) on one of the smaller rings, and one (LA2) on the main ring. On the smaller ring, we caught all traffic in and out of the router. On the main ring we caught all broadcast traffic, all traffic in and out of the "who" server, and all traffic in and out of that router. We told engineers to halt the LANalyzers whenever they had a report of a dropped connection, and we would look at the problem in the morning.

The next morning they had very few reports of the network failing. They had two traces for us. One was a failure on the subring we were watching. Two were failures from the LocalTalk segment, whose router we were not specifically watching. In the case of the failure on the subring, we were watching, the traffic on the main ring was so high that we couldn't get enough information about the history before the crash.

We did see that the server (who2) had sent an ASP close connection request to the workstation, and that the workstation had received it. The server issues a close connection usually only when there aren't enough ASP tickle packets to convince the server that the connection is still up. But we could not look far enough back in time to see the cause of this close.

We looked at one of the LocalTalk failure traces, expecting to find little of interest, because we weren't specifically targeting that router. However, the LANalyzer on the main ring told an interesting story. What follows is my interpretation of the trace, showing the important points. There is probably other information to be gleaned from the trace.

Packet #186 the first traffic between WHO and the LocalTalk connected router about the ASP connection in question (called 17103\_air) was a tickle packet. Instead of sending the tickle directly over the Ethernet, the packet was sent to a different router (let's call it MYSTERY) on the ring, one that we couldn't identify. Time 7:43:31.

Packet #36517103\_air starts sending AARP request broadcasts, looking for the WHO node. It sends one every 200 millisec, and about 3 millisec later the WHO server responds. It seems that the AARP responses are well formed, but 17103\_air continues to rebroadcast. This continues for approximately 15 seconds, and during that time no traffic between 17103\_air and WHO takes place. We see some, but not much, traffic between 17103\_air and the other router we were monitoring. Time 7:43:42.

Packet #64017103\_air stops sending AARP requests to WHO, and starts sending packets. Several retries of an ASP Request are sent, all within a second, and the server responds back to 17103\_air correctly in each case. The connection will continue correctly for a while, with 17103\_air sending directly to WHO and vice versa. Time 7:43:57

Packet #95317103\_air sends an ASP Req packet to WHO, and WHO sends the response to a new and different Token Ring address (MYSTERY2). We don't

see this node forward the packet, but 17103\_air sends the ASP release directly to WHO, so the connection is still up, and the packet did get to the end Macintosh. The connection continues, with WHO sending most of its packets on this connection (destined eventually for 17103\_air) to MYSTERY2.

Packet #1161 WHO sends its tickle packet to MYSTERY2 instead of 17103\_air.

Packet #1387 WHO sends an ASP Response to MYSTERY (remember him?).

Packet #1843 17103\_air starts sending AARP request packets, looking for node WHO. Like in the sequence starting in packet 356, AARP requests are sent every 200 microsec, and WHO responds correctly to each and every request. 17103\_air continues to request. We see no further packets from 17103\_air to WHO. WHO continues to send tickle packets destined for the end workstation, but sends them to all kinds of routers (MYSTERY, MYSTERY2). Time 7:45:20.

Packet #4516 WHO sends a close connection packet to the workstation through 17102\_air (the router we were watching in the first place). 17103\_air is still AARPing. Time 7:47:09.

Packet #5043 17103\_air stops AARPing. It does not send any further packets to WHO. The connection is dead. Time 7:47:26.

#### Questions and Problems

-----  
The first and most interesting question is why does the Apple Internet Router continue to AARP over and over again? Another question is, why did it stop AARPing in the first case, in so little time as to let the connection stay alive? Looking at the trace we see another router, 17102\_air, AARP over and over again for the server WHO2.

This is obviously not an isolated problem, and it is the cause of the destruction of the connections. Possibly, it also backs up the router queues, and thus prevents NBP lookups, accounting for our NBP problems. The router statistics are showing a large number of "overflows" whatever that is.

The second question is why the 286 VAPs start sending to other routers besides the correct router (MYSTERY, MYSTERY2). Secondly, the VAPs do not seem to redirect back to the correct router after getting a packet from it. However, although "Inside AppleTalk" suggests the caching of routers and building up of a RTMP table via the RTMP stub, nothing particularly bad will happen except loss of bandwidth and overburdening of routers.

In conclusion, the company's problem is a sporadic loss of routing through our Apple Internet Routers, caused by an illegal activity of the AIRs (not accepting AARP responses correctly). The cause of this failure remains unknown.

DISCUSSION -----

The central problem is that printers, file servers, and mail servers drop in and out of the Chooser. This brings up a couple of questions. How many of each type of device do you have in each zone? Could you do an Inter•Poll of the affected zones for each type of device in question and send us the information? Here is some information and a possible answer:

This is how the Chooser really works in a nutshell:

The Chooser sends out a Name Binding Protocol (NBP) packet looking for all devices of type XXXXXX (for example, type LaserWriter). It sets up a buffer of 512 bytes for the responses. The responses look like:

|                    |                |                        |
|--------------------|----------------|------------------------|
| device name length | 1 byte         |                        |
| device name        | variable bytes | e.g. MyLaser-Hands off |
| type name length   | 1 byte         |                        |
| type name          | variable bytes | e.g. LaserWriter       |
| zone field length  | 1 byte         |                        |
| zone name field    | variable bytes | probably *             |

The Chooser gets such a packet back for each device, i.e., each LaserWriter. When the 512-byte buffer is full of these packets, it stops looking for device names to display. This means that some LaserWriters might not be displayed immediately. If you leave the Chooser window open, however, the Chooser continues to send out NBP lookups every 1.47 seconds. Different LaserWriters could respond more quickly each time. In this case, you may see the Chooser show and hide various devices.

This means that the number of devices the Chooser can show really depends on how long the type name (like "LaserWriter") is and how long the device names are.

The number 18 is an average number, based on device names being about 13- or 14 characters long and the device name being about 10 or 11 characters long.

In System 7.0, the buffer size for the Chooser is increased to 1024. This means, on an average, about 36 devices will be able to be displayed.

There is a way to affect the manner in which the lookup is done, which could help in some environments, especially in wide-area-network environments where slow data links may be used. If you modify the GNRL resource in the Chooser document (AppleShare, for example), it will affect every NBP lookup that is done from the Chooser for that type of device.

The Chooser uses these values to determine the NBP lookup interval and retry values for the current NBP transaction. The default of 0705 tells the Chooser to send five NBP lookup requests at an interval of 7/8ths of a second. This process is repeated in an infinite loop, until the user closes the Chooser.

Chooser Event Flow Example:

```
User opens Chooser and selects the AppleShare CDEV
GNRL resource -4096 loaded value = (5002)
NBP lookup mechanism started
```

```
NBP Loop:
```

```
    Get NBP ID for this transaction
```

```
        (Note: All NBP request and replies for this loop will use
            this ID)
```

```
    Send first lookup (NBP ID = "New")
```

```
    Collect and display responses from the NBP lookup ID "New"
```

```
    Wait 10.6 seconds
```

```
    Send second lookup (NBP ID still = "New")
```

```
    Collect and display responses from the NBP lookup ID "New"
```

```
    Wait 10.6 seconds
```

```
    Discard all buffers and data associated with NBP ID "New"
```

```
        (Note: If a response is received for NBP lookup ID =
            "New" after this point the reply data would be discarded
            and the device would not be added to the list in the
            Chooser)
```

```
    Do some other misc. cleanup (approx. time 1 sec)
```

```
    goto NBP Loop
```

```
End NBP Loop:
```

With the retry timer set to such a large value the multiple retry count is really not necessary. On the other hand, it doesn't hurt either, and it effectively increases the time we'll wait for NBP replies to over 20 seconds for the current transaction. The idea behind the retry count is to send several lookup requests out in quick succession (default < 1 sec.), in case there are devices which were unable to respond because they were busy or because the previous packet never reached them.

The reason that increasing the interval timer helps in the case of remote servers is directly tied to the way the NBP mechanism works. The Chooser maintains only 1 NBP lookup request at a time, tracking all replies to that request by way of the NBP ID mechanism. Replies that are received that do not match the current request ID are discarded.

The request ID is maintained only for the current NBP request, the interval and retry counters for this request can be tuned via the GNRL resource. In other words, if you set the retry counter to 10 and the interval timer to 50 the NBP ID would be maintained for 10 requests at an interval of 10.6 seconds. The GNRL resource is documented in "Inside Macintosh, Vol. 4", page 216.

AARP Issue

-----

The symptoms you describe with the Apple Internet router AARPing for the same node over and over is probably attributed to the router being

overloaded and not able to accept the response AARPs. You mention that the router is getting a fair amount of overflow errors, this would lead me to believe that the routers are indeed overloaded.

What ports on the routers are getting the overflow errors and how many are reported over the course of a day, a week? Overflow errors are caused by the router being too busy to process all incoming packets on an interface. The network interface chip set can detect that a packet was available but that the processor was too busy to get the packet from the interface before the next packet arrived. There may be some other problems related to your environment, but this is a good starting point.

#### Novell VAPs Sending to Random Routers

-----  
AppleTalk Phase 2 does provide an enhancement that lets your node cache network to router pairs for use when determining where to route a packet destined for a remote network. When the AppleTalk protocol DDP receives a packet from a remote network, it strips off the data-link source address of the packet. This is the address of the last router on the route from the original network. This router should generally be the optimal router in terms of hop count back to the original network. You can then use that router for any future transactions to that network.

Now that I've explained all of that, you're saying, "Okay, that sounds right, but the Novell server is not doing what it's supposed to." The real story is that this enhancement is an optional, implementation-specific addition that is not required by the AppleTalk protocol. In this case, it would be normal for the Novell server to act the way that you described, if they did not implement the "Best Router" enhancement.

#### Conclusions

-----  
We first need to get a handle on the environment that you have, including numbers of devices per network and per zone. We need to take a close look at the statistics from the Apple Internet routers, average load on the various network segments as measured by the Internet Router, as measured by a network monitor/analyzer.

A close look at traffic patterns could also be helpful in determining where to best segment the network if it becomes necessary. It may be that the traffic on the main ring is so heavy that the Macintosh routers can't keep up. We don't really have any statistical, benchmark, or historic information that would tell us when the use of an AIR on a token ring is not going to offer the best performance. At this point, we just need to collect all the information and then take it one step at a time.

The LANalyzer traces wouldn't do us any good, because we have a Network General Sniffer. If we really need to see some trace data, we'll do some tests using a Sniffer on your end, or the LANalyzer data could be saved to an ASCII file and shipped to us on a tape. I don't think we need to worry about the trace data yet.

## IIGS: Visit Monitor 03 Same as Released Version

Revised: 5/29/91  
Security: Everyone

IIGS: "Visit Monitor" 03 Same as Released Version

=====

Article Created: 15 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there a difference between the Apple IIGS (ROM 03) I own, and other Apple IIGS systems with ROM version 03? My 03 is one of the first few hundred that were accidentally assembled with "Memory Peeker" and "Visit Monitor" stuck in the Classic Desk Accessories menu.

Anyway, I've documented a list of things that seem to be wrong with my ROM 03 Apple IIGS. Could you try out the things on the list with your ROM 03 (one without "Memory Peeker" and "Visit Monitor" in the CDA menu), and let me know if any of those things happen on your Apple IIGS.

### The System Monitor

-----

After entering Monitor with a "CALL-151" command or accessing it through "Visit Monitor/CDA", the system will freeze after entering the "LIST" command. Pressing any key after this causes a continuous scroll of inverse text, while the Error bell rings non-stop. Strangely enough, pressing certain keys will display different graphic modes while this is happening, replacing the scrolling text, but with the error bell still ringing, and no way to stop it.

### Applesoft BASIC

-----

When trying to run any program written in Applesoft BASIC that launches GS-specific programs (i.e., doing calls to Apple IIGS ROMs or hardware), the program will not run and gives this error message:

```
?SYNTAX ERROR IN 65182
```

All programs give the same error message. After this error message occurs

from trying to load an Applesoft BASIC program, the GS/OS operating system won't run. Trying to load any disk that uses GS/OS to boot up will crash after the "Welcome to the Apple IIGS" message appears and gives the following error message:

Error Loading Apple IIGS.OS File. Error=\$002E

After this you must turn the computer off for 30 seconds or more before you can load GS/OS without getting the same error message.

#### MDIdeas Card

-----

When plugged into my ROM 03 Apple IIGS, the Stereo/Digitizer card from MDIdeas, does not function properly. Any sound that's recorded with the card is played back with an echo, and is noisy and scratchy (incompatible with either card or software). The card and software are not at fault, because they work perfectly on my other Apple IIGS, which is a ROM 01.

#### Software

-----

Many software applications will not run on my Apple IIGS with the 03 ROMs, while they apparently run on other 03 ROM-d systems. (This includes public-domain and commercial software titles.)

#### RAM Disk

-----

With 2.125MB in my Apple IIGS, there's a maximum RAM disk size of 1,920K. The system will not auto-format a RAM disk larger than 1,888K in size. Selecting 1,920K from Control Panel won't auto-format.

- Each time you reset the computer to auto-format a RAM disk, the system freezes for 5 or more seconds.
- When a RAM disk is created, the system will erase the entire RAM disk after using Open-Apple Reset command a couple of times. (It seems to change the setting in the Control Panel to "Resize after reset: YES", thereby changing the setting by itself.)

#### Disk Access Slows Down

-----

When loading up some GS-specific programs that use ProDOS 8 or ProDOS 16 as a launcher, the computer seems to have trouble loading ProDOS, and then trouble loading the main program system file. The program will take two to three times longer to start up than it will on a ROM 01-GS or other ROM 03-GS systems. It slows down so much that it appears the disk is damaged or corrupted. Some examples of programs that have this problem are "Diversi-Tune" and "Tunnel of Armageddon".

#### DISCUSSION -----

Most of these problems can be avoided. The ROMs (early and late) are identical. Some systems went out configured improperly. Anyway, I'll take them one at a time.

## System Monitor

-----

"LIST" is not a Monitor command. To list the contents of memory locations, you only need to type "l" or "L". When the monitor sees "LIST" it scrolls 20 lines of location contents and then sets the display to inverse. The monitor queues commands typed as a string; the second command in the string is "i"; the command for inverse. "S" and "T" are not Monitor commands and seem to confuse the system. Typing "l", a carriage return, "i" and a carriage return works fine. You should read the "Apple IIGS Firmware Reference" for a complete description of the Monitor and its commands.

## Applesoft BASIC

-----

Without an exact description of the steps required to create the problem described, we can only speculate as to the cause of the problem.

It sounds as if you are trying to run a ProDOS-16 application from ProDOS-8. Whatever the case, some memory locations are being stomped on, seriously scrambling memory, because the system thinks a disk has been switched. If this continues to be a problem, let us know exactly what you are doing to cause this crash, and we'll dig into it.

## MDIdeas Card

-----

The MDIdeas card was developed for the original Apple IIGS. The company is now out of business and has therefore not upgraded the product to work with the new ROMs. The card (or perhaps the accompanying software) is not compatible with the new version of the ROMs. Applied Engineering offers a comparable product that is compatible with the new ROMs.

## Software

-----

We will need concrete examples of the differences when software is run on two different systems, because the ROMs are identical. The problems exhibited here may be a result of a drive problem (discussed in the "slows down" section below).

## RAM Disk

-----

It sounds as if you are using the Classic Control Panel to modify the RAM disk. The Classic Control Panel is not aware of the memory requirements of GS/OS and will let the user set unreasonable RAM disk sizes. GS/OS will re-assign the value as it "takes" memory back at boot time. Using the Graphic Control Panel will eliminate this problem. This is not a bug, because the Classic Control Panel is necessary when using the system with ProDOS-8.

As a side note, pressing Open-Apple-Reset is not a very elegant way to re-start the system. We highly recommend the use of menu-bar selections over this method. Use Open-Apple-Reset only as a last-ditch effort.

## Disk Access Slows Down

-----

The slowdown your customer is experiencing could be a result of copy-protected software. If other Apple IIGS systems with the same ROMs (03) load the software more quickly, swap in a disk drive from one of the other systems. It's possible that the drive is in need of cleaning, and has troubles reading copy-protected disks.

Again, the ROMs you received are the same as the ROMs shipped in later systems.

## Macintosh LC and Macintosh LC II: 16-Bit Color

Revised: 7/23/92  
Security: Everyone

Macintosh LC and Macintosh LC II: 16-Bit Color

=====

Article Created: 15 February 1992  
Article Last Reviewed: 23 July 1992  
Article Last Updated: 24 April 1992

TOPIC -----

John Sculley said something at MacWorld about the support of "thousands" of colors with 16-bit color on the Macintosh LC. Is that true?

DISCUSSION -----

Yes, it is true. This was announced at the introduction of Macintosh LC. The product is called the Macintosh LC 512K VRAM SIMM (M0517LL/A) and was made available in February 1991.

The standard Macintosh LC and the new Macintosh LC II support these video configurations:

- Macintosh 12-Inch Monochrome Display: 2, 4, or 16 shades of gray
- Macintosh 12-Inch RGB Display: 2, 4, 16, or 256 colors
- AppleColor High-Resolution RGB Monitor (13-inch): 2, 4, or 16 colors

With the Macintosh LC 512K VRAM SIMM (M0517LL/A) installed, the Macintosh LC and Macintosh LC II support these video configurations:

- Macintosh 12-Inch Monochrome Display: 2, 4, 16, or 256 shades of gray
- Macintosh 12-Inch RGB Display: 2, 4, 16, 256, or 32,000 colors
- AppleColor High-Resolution RGB Monitor (13-inch): 2, 4, 16, or 256 colors

Note

----

The Macintosh LC and LC II do not support full 16-bit color, which allows over 65,000 colors.

## A/UX newfs and Sony Optical Disk Drive

Revised: 11/9/92  
Security: Everyone

A/UX newfs and Sony Optical Disk Drive

Article Created: 15 February 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I have a private Sony SMO-C501-00 (Magneto-Optical disk). I did a newfs and mounted it under A/UX. I've formatted it under SilverLining 5.25 with a Slice 3 partition (287MB) under Macintosh OS. But when I created the newfs on it under A/UX, the options were quite confusing. After several unsuccessful attempts, I chose to recognize it as a 160SC disk, and then the miracle occurs! The newfs command was working perfectly! So my question is:

Is this normal? Does the newfs command recognize the hardware specification of the disk and bypass the /etc/disktab or newfs options, whatever your choice is?

### DISCUSSION -----

The problem that you were getting with a smaller size of file system or something confusing about the newfs options was possibly due to the wrong type of disk drive you've chosen when creating the file system via "newfs". We don't know what option(s) of "newfs" syntax you specified. We are not sure if you have the right size of file system (with 287MB) after you chose 160SC disk type.

You should choose a drive type which is closer to your drive specification, or you could create a new entry with the drive physical characteristics (number of sectors/track, number of tracks/cylinder, and the number of cylinders/disk) in /etc/disktab for the particular disk drive. "newfs"

## ..TIL07014-A-UX\_newfs\_and\_Sony\_Optical\_Disk\_Drive\_(TA45433).pdf

reads the information from /dev/disktab for a particular drive type and invokes the /etc/fs/ufs/mkfs program to make a file system for a partition.

## DAL 1.2: How to Get Listener Module for VMS 5.4

Revised: 9/2/92  
Security: Everyone

DAL 1.2: How to Get Listener Module for VMS 5.4

Article Created: 6 May 1991

### Article Change History

-----  
08/12/92 - REVIEWED  
• For technical accuracy

### TOPIC -----

I am planning to upgrade our VAXcluster to VMS 5.4 and need a copy of the DAL listener module that supports the 5.4 password hashing algorithm. Does the DAL package that ships with PATHWORKS for Macintosh from DEC support 5.4? Or do I need a new listener? How do get a copy of the module?

### DISCUSSION -----

Note: Earlier versions of DAL were referred to as CL/1.

There is a compatibility problem with the new VMS 5.4 release and the CL/1 1.0 and 1.1 VAX/VMS servers. Due to changes in VMS password authentication in VMS 5.4, AppleTalk connections fail when made to the earlier versions of VAX/VMS Server (CL/1 Servers 1.0 and 1.1) running on a VMS 5.4 system. This is a problem with AppleTalk connections only; asynchronous connections do work. There is no workaround for the 1.0 and 1.1 versions.

DAL 1.2 is compatible with VAX/VMS 5.1 through 5.3. Compatibility with VAX/VMS 5.4 is shown below.

| VMS 5.4 Compatibility |           |
|-----------------------|-----------|
| Async                 | AppleTalk |
| -----                 | -----     |

|              |     |      |
|--------------|-----|------|
| CL/1 1.0,1.1 | Yes | No   |
| APDA DAL 1.2 | Yes | No * |

\* If you have recently installed VAX/VMS 5.4 or are planning on upgrading to 5.4, please contact the Technical Answerline, so that we may send you a new DAL Listener module that is compatible with VAX/VMS 5.4. As of release 1.3 of DAL, VMS 5.4 is supported as part of the standard product.

When customers purchase Data Access Language, they have a card that they can send in for support on Technical Answerline for 90 days. After that, they can purchase a one-year Technical Answerline support. They can purchase this Technical Answerline contract from a dealer. Customers on a support contract may call the Technical Answerline to request for the DAL Listener module that works with VAX/VMS 5.4.

## **PATHWORKS: How to Create a System 6.0.7 Installer Disk**

Revised: 5/31/91  
Security: Everyone

PATHWORKS: How to Create a System 6.0.7 Installer Disk

=====

This article last reviewed: 15 February 1991

TOPIC -----

How can one create a PATHWORKS for Macintosh Installer Disk with System Software 6.0.7?

DISCUSSION -----

The PATHWORKS for Macintosh Installer Disk is just like a normal System Software 6.0.7 startup disk with AppleShare Workstation software, so you can access to a VAXshare file server. All the PATHWORKS for Macintosh software is located on the VAXshare file server. The PATHWORKS Installer Disk works when your Macintosh is connected to the Digital network through LocalTalk and a router, or through an Apple EtherTalk NB card. EtherTalk software must be installed on this Installer Disk for this use.

## A/UX 2.0: Double-Click Behavior and Locked Files

Revised: 11/9/92  
Security: Everyone

A/UX 2.0: Double-Click Behavior and Locked Files

=====

Article Created: 18 February 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

One annoying aspect of A/UX is that it sometimes fails to respond promptly to mouse clicks (presumably because the preemptive time slicer has preempted the task running my Macintosh window and has given the CPU to someone else).

So, for example, when I'm trying to edit a file name by clicking the name under the icon, I often find myself launching the software instead, because the Macintosh "double-click detector" thinks I double-clicked, when in fact I only clicked twice in the text field of the icon. In other words, the definition of "double-click" seems to be variable under A/UX.

### DISCUSSION -----

Although A/UX handles jobs based on a preemptive, time-slice basis, we can't reproduce the mouse double-clicking behavior that you described. In any case, here is the scenario of the mouse motion:

If the file is UNLOCKED and the mouse is pointed and single-clicked on the name of that file under the icon, the mouse symbol SHOULD change from arrow pointer to I-beam which lets you change the name of the file (the name is then highlighted). Then, when the mouse is double-clicked on the name, the word in the name is selected and allowed to change that word. When the mouse pointer leaves the name area, it becomes an arrow point.

If the file is LOCKED and the mouse is pointed and a single-clicked on the name of that file under the icon, the mouse symbol remains an arrow pointer which means the name of file can't be changed, because it was LOCKED. In this case, if the mouse is double-clicked on the name of the locked file, it will launch the program.

Check if the file to be renamed is LOCKED or UNLOCKED.

## MacX 1.1: Visual Types Supported

Revised: 4/20/93  
Security: Everyone

MacX 1.1: Visual Types Supported

=====

Article Created: 18 February 1991

### Article Change History

-----

04/20/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

Which visual types does MacX support--static gray, pseudo color, direct color? I have observed a response of static gray to a visual type query when using an RGB monitor. Would the individual display (B/W rooted, rootless and Color rooted, rootless) return a different visual type when queried? How does it handle different monitors on the same system and the client application running across those different monitors?

### DISCUSSION -----

MacX, like all X11r4-based servers, supports all visual types on the 8-bit screens that make sense. This means that, given the right colormap, MacX can support or "fake" PseudoColor, DirectColor, Gray scale, StaticGray, StaticColor, and TrueColor. You can use xdpinfo to see all of these visuals.

## MacX: Arc-Drawing Algorithms

Revised: 4/20/93  
Security: Everyone

MacX: Arc-Drawing Algorithms

=====

Article Created: 18 February 1991

### Article Change History

-----

04/20/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

In terms of drawing algorithms, MacX has apparently optimized arc-drawing algorithms, but wide-line drawing seems to be extremely slow. I noticed this while working with mwm.

### DISCUSSION -----

You are correct. Much better arc drawing code is present in MacX than is present in many X11 servers. On machines that have a floating point unit (all Mac II-class machines, Macintosh SE, and Macintosh IIsx with FPU installed), MacX uses this hardware to achieve good arc-drawing performance. Without an FPU, MacX uses SANE to do its floating point, but it is still pretty fast. Thick lines are slow. Actually, pretty much the same arc-drawing code appears in MacX 1.0 as in MacX 1.1.

## NCSA Telnet 2.3: Questions and Diagnosis

Revised: 5/31/91  
Security: Everyone

NCSA Telnet 2.3: Questions and Diagnosis

=====

This article last reviewed: 18 February 1991

TOPIC -----

I have a two problems regarding Telnet. I have been using Telnet rev 2.2 and recently upgraded to Telnet 2.3, which is now using MacTCP 1.01. I am using a LocalTalk connection to a Kinetics FastPath IV rev J. I have not yet upgraded these units for Phase 2 AppleTalk yet. Every time I try to transfer a file using FTP from my Sun system to the Macintosh, it hangs my machine.

The other new error happens when I am doing a Telnet session--I get NCSA Telnet error #1, program unexpectedly quit. It is independent of CPU (I am using system 6.0.5 on all systems). The problem showed up when I upgraded to Telnet 2.3. Have you heard of any problems like this one?

DISCUSSION -----

We haven't heard any problem like this. There are two versions of NCSA Telnet 2.3, one is Telnet without MacTCP, the other is Telnet with MacTCP. Here are some things to check:

- Make sure you're using the right version of NCSA Telnet 2.3.  
In this case, you must use NCSA Telnet 2.3 with MacTCP.
- Was MacTCP driver installed and configured properly?
- Was Kinetics FastPath software installed and configured properly?
- Try running "MacTCP Spy" from the Macintosh OS to see if MacTCP is up and running.
- From the Sun machine, try to use "ping", a generic UNIX network utility, to send an ICMP packet to the Macintosh machine to make sure they are talking to each other.

- Try to increase the NCSA Telnet 2.3 with MacTCP application memory size.  
This is done via Get Info.

## Software that Compares Files after Copying (2/91)

Revised: 8/4/93  
Security: Everyone

Software that Compares Files after Copying (2/91)

=====

Article Created: 18 February 1991

TOPIC -----

When you do a regular copy on a Macintosh (drag a folder or file to another volume), does the Finder do any compare or verify in that command?

Is there any program that can compare two different files to see if they are totally equal? I need a program that verifies that a copy of a file is an image of the original.

DISCUSSION -----

After a copy, the Finder does minimal checking to see if any errors were logged during the copy or verify. It doesn't do a checksum, or any byte-for-byte comparisons of the file.

As for file comparisons, the Hard Disk Jockey disk utility from FWB lets the user copy and verify (among other things) files on disk.

The Macintosh Programmer's Workshop (MPW), available from APDA, comes with two utilities for comparing files:

- Compare compares the lines of two text files and writes their differences to standard output. Options are provided to compare a specific column range in each file, to ignore blanks, and to ignore case.
- ResEqual compares the resources in two files and writes differences in type, identifier, size, or contents to standard output.

To locate a vendor's address and phone numbers, use vendor name as a search string.

## LaserWriter IINTX: Hard Disks Can Be Cloned under A/UX (11/94)

Revised: 11/7/94  
Security: Everyone

LaserWriter IINTX: Hard Disks Can Be Cloned under A/UX (11/94)

Article Created: 06 May 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I have attached to a LaserWriter IINTX a hard drive that is apparently bad. Because there is another unit which is still in good condition, is there a way to transfer the contents of the good hard disk to the other?

DISCUSSION -----

We don't have a utility specifically designed to copy or back up font info stored on LaserWriter hard disks, but you can clone the disk under A/UX.

- Connect two drives of the same size to an A/UX system.
- Set the SCSI address of the source drive to 5 and the target drive to 6.
- Boot A/UX and login as root.
- At the command line, type:

```
# dd if=/dev/dsk/c5d0s31 of=/dev/dsk/c6d0s31 (do not type the #)
```

The process will take about 1 minute per megabyte of disk space. When it is complete, type:

```
# sync;sync;sync
```

Log out and shut down the system. Re-connect the disk to the LaserWriter, power-up and print.

DISCUSSION -----

NOTE: As of December 1993, Independence Technologies, Inc. (ITI) took ownership of the DAL technology. Contact ITI for current product information.

Data Access Language (DAL) 1.3 will work with A/UX 2.0 or 2.0.1. Connections can be made via asynch or TCP/IP but not AppleTalk because A/UX 2.0 and A/UX 2.0.1 don't support ADSP. DAL 1.3.6 supports A/UX 3.0 and ADSP is supported to A/UX as of that release.

Oracle, The Ask Group, Inc./Ingres Products, and Sybase have announced a server that runs on an A/UX 2.0 platform.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

### Article Change History:

## LaserWriter: Deleting Pages from RAM

Revised: 5/21/91  
Security: Everyone

LaserWriter: Deleting Pages from RAM

=====

Article Created: 18 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

After the LaserWriter prints a document, does an image of the document remain in the LaserWriter's RAM? If so, when does it get removed?

DISCUSSION -----

After the LaserWriter gets the image of the page in memory, the PostScript command "showpage" is called to print the page. The "showpage" command looks up the value in "#copies" to determine how many copies to print and then prints that number of pages. Once the printing is completed, the "showpage" command does the equivalent of the "erasepage" and "initgraphics" PostScript commands.

The "erasepage" command erases the entire image in the LaserWriter memory by painting it with gray level 1, which is normally white. The "initgraphics" command resets many of the graphics states to their default values.

For more information on "showpage", "erasepage", and "initgraphics", see pages 238, 161, and 184, respectively, of the "PostScript Language Reference Manual" (the Red Book).

## Multiplan: Doesn't Run on the Macintosh Classic

Revised: 5/31/91  
Security: Everyone

Multiplan: Doesn't Run on the Macintosh Classic

=====

This article last reviewed: 22 February 1991

TOPIC -----

I bought a Macintosh Classic to replace a Macintosh Plus. I am using System Software 6.0.7 and Multiplan version 2.4. Multiplan bombs on the Macintosh Classic. You can start the program, but when you try to enter anything in a cell, it gives an error message saying there is an address error, and you have to restart the Macintosh.

Could the problem might be that Multiplan just won't work under System Software 6.0.7?

DISCUSSION -----

The latest version of Multiplan is Multiplan 1.1, and it doesn't work on the Macintosh Classic. Multiplan 1.1 has not been sold in the U.S. since 1986.

Microsoft Technical Support told us that the latest version of System Software that Multiplan 1.1 was tested with is System Software 2.0 which used System 4.1 and Finder 5.5. Microsoft no longer supports Multiplan and suggests upgrading to Excel.

## ROLMphone 244PC Phone Controller

Revised: 5/29/91  
Security: Everyone

ROLMphone 244PC Phone Controller

=====  
Article Created: 18 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are you folks aware of a Macintosh product that controls a ROLM 244-PC phone? I am looking for something with the same feature set as IBM's "Personal Telephone Manager"

DISCUSSION -----

There is a Macintosh ROLM 244-PC phone "control" application:

The ROLMphone 244PC is a smart, voice and data-communications telephone that links personal computers to the ROLM 9751 CBX and ROLM CBX II family of voice/data controllers. It combines a digital ROLM telephone with data communications features that support the "AT" intelligent modem command set. The ROLMphone 244PC also includes a documented programming interface (API) that lets programmers design specific, telephone-enhanced applications in areas like outbound dialing, inbound answering, telephone management, and integrated voice/data applications. The documented ROLMphone 244PC API lets a user write customized applications.

You may wish to contact ROLM's direct sales and support team for a copy of the API documentation and write your own control program.

## Document Time-Monitor Software Needed

Revised: 5/29/91  
Security: Everyone

Document Time-Monitor Software Needed

=====

Article Created: 18 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a newspaper running four Macintosh IIcx computers on a AppleShare Macintosh SE/30 server and printing to a Birmy Imagesetter with its own spooler. The production manager needs to track the documents off each workstation, documenting how long was spent on each document and its deadtime (the amount of time the document was open but no keyboard or mouse action took place). We've looked at Macintosh-In-Use, but it only totals up all the deadtime from that workstation, and doesn't seem to be able to apply it to the individual document.

DISCUSSION -----

We don't know of a product that will do the above. One developer we mentioned to you may design and ship a product this year somewhat along these lines, but has not yet started on it or determined its feature set.

If anyone else knows of a document time monitor, please send in whatever details you have to TECH.COMM.

## A/UX 2.0: CmdShell vi Repeat Key Problem on Macintosh IIfx 8/94

Revised: 8/25/94  
Security: Everyone

A/UX 2.0: CmdShell vi Repeat Key Problem on Macintosh IIfx 8/94

Article Created: 18 February 1991  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

I've noticed another bug in A/UX 2.0, but only on Macintosh IIfx. To see it, do these steps:

- 1) Open a CommandShell Window, and in this window open a big text file (/FILE for instance) with the vi editor.
- 2) Type some text and all seems to be okay. But sometimes, you will notice that if you use a key with auto-repeat mode, the auto-repeat mode will stop without any reason (for example, while holding down an arrow key).

If you want the auto-repeat function to start again, you must hit the release the key and press it again, or you must move the mouse outside a window (in this last case, you are not obliged to release the key).

DISCUSSION -----

We have verified the symptom of the repeat key performed in vi under CommandShell with a Macintosh IIfx running A/UX 2.0. This strange behavior on the repeating key will be sent to A/UX engineering for further investigation.

For your information, here are two scenarios. In A/UX 2.0, both the mouse pointer and the current keyboard cursor are coexistent. However, in A/UX 2.0.1b2, the mouse disappears from the desktop as soon as the keyboard is activated.

## A/UX and Apple CD-ROM: Commando mount Minor Bug (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX and Apple CD-ROM: Commando "mount" Minor Bug (8/94)

=====

Article Created: 22 February 1991  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

I am trying to mount a CD ROM under A/UX, using Commando to build the command.  
When you select "Read Only" mounting options for the "mount" command, it  
returns

```
mount -r -o rw
```

If you click the appropriate option, does the -r override the rw option?

DISCUSSION -----

The Commando returns "mount -o rw" after choosing "Mount specified filesystem"  
because the default option for "mount" is read/write. The Commando produces  
"mount -r -o rw" after choosing "Read Only".

Because "-r" is identical to "-o ro", the "Read Only" operation SHOULD override  
the previous default (rw) option. However, The "-o rw" can be changed to "-o  
ro" by selecting "Read Only" from the "Other options" button.

## A/UX AppleTalk Network Configuration (8/93)

Revised: 8/17/93  
Security: Everyone

A/UX AppleTalk Network Configuration (8/93)

Article Created: 22 February 1991  
Article Reviewed/Updated: 17 August 1993

TOPIC -----

I have a problem with my A/UX 2.0 network configuration. My network is okay when working with MACpartition, but when I start up A/UX, all the zones disappear. My configuration is:

Macintosh IIci with 8MB  
External LA CIE 80MB Hard Disk  
Apples NB Ethernet board

DISCUSSION -----

Based on the fact that the zones disappear, we suggest you consider the following diagnostic questions:

- Is AppleShare server and/or PrintServer and/or Apple Internet Router on the AppleTalk network based on AppleTalk Phase 2? A/UX 2.0 does not support AppleTalk Phase 1.
- Is "appletalk" configured within A/UX 2.0 kernel? Use "module\_dump /unix" to verify it.
- Is "appletalk" currently running? Use "appletalk -s" to see the status. Use "appletalk -d" to bring AppleTalk network DOWN, and use "appletalk -u" to bring the AppleTalk network UP.
- Make sure the interface is properly selected; this is specified in the /etc/appletalkrc file.
- Refer to Chapter 6 of "Administering AppleTalk" in A/UX Network System Administration for more detailed information.

The message "appletalk: No such file or directory" from the "appletalk -u"

command output is a strong indication that the /dev/appletalk directory and/or its sub-directories and files are probably missing or corrupted. Normally, the /dev/appletalk directory should include as follows:

```
total 4
drwxr-xr-x  2 bin      bin          512 Dec  7 10:07 ddp
drwxr-xr-x  4 bin      bin          512 Dec  6 18:01 lap

appletalk/ddp:
total 0
crw-rw-rw-  1 bin      bin          12, 16 Jan 15 16:15 socket

appletalk/lap:
total 4
drwxr-xr-x  2 bin      bin          512 Dec  7 10:07 ethertalk0
drwxr-xr-x  2 bin      bin          512 Dec  7 10:07 localtalk0

appletalk/lap/ethertalk0:
total 0
crw-rw-rw-  1 bin      bin          15,  0 Dec  7 10:07 control

appletalk/lap/localtalk0:
total 0
crw-rw-rw-  1 bin      bin          17,  0 Dec  7 10:07 control
```

If the /dev/appletalk directory is causing the problem, do these steps:

- 1) Run a file system check on the Root file system: `fsck /dev/dsk/c?d0s0`
- 2) De-install the appletalk module from the kernel: `newconfig noappletalk`
- 3) Re-install the appletalk into the kernel: `newconfig appletalk`

After re-installing appletalk, the appletalk modules, the /dev/appletalk directory and its sub-directories and files will be correctly re-created.

## Plotter: Sharing on AppleTalk Network

Revised: 5/21/91  
Security: Everyone

Plotter: Sharing on AppleTalk Network

=====

This article last reviewed: 22 February 1991

TOPIC -----

Do you know how to share an HP Plotter between Macintoshes and PCs on an AppleTalk network?

DISCUSSION -----

We found a Macintosh-only solution from Palomar Software. PLOTTERgeist is a Chooser-selected driver for plotters connected to a network via Shiva's NetSerial product. You could work around the no-PC limitation by connecting the plotter to an A/B switchbox connected to the NetSerial on one port and a peripheral-sharing switchbox (Black Box has them) on the other.

For contact information, search the Technical Info library under "Palomar Software" and "Black Box."

## AppleShare PC: NDIS Compliant? (11/94)

Revised: 11/7/94  
Security: Everyone

AppleShare PC: NDIS Compliant? (11/94)

Article Created: 22 February 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

Is AppleShare PC NDIS compliant? I would like to run AppleTalk and TCP/IP protocols through the LocalTalk PC Card at the same time.

DISCUSSION -----

The Microsoft/3Com specification known as the Network Driver Interface Standard (NDIS) specifies software requirements and its interface to hardware and protocol stacks for PC network drivers. It is, therefore, very similar in purpose to our Open Data-Link Interface specification (ODI) which we co-developed with Novell.

However, each of these specifications detail similar requirements in very different ways. An application written to one standard cannot work with drivers based on the other. The two specifications are essentially competitors in the PC-network, driver-architecture world.

Because of this, a protocol stack based on one standard cannot coexist on a network card with a protocol stack for the other standard. This is the unfortunate side effect of two competing standards. A user must use one or the other set of software at one time. Switching between them generally requires rebooting the computer.

Because AppleShare PC 2.0.x is based on the ODI specification, software based on NDIS cannot use a network interface card while AppleShare PC is using it. This prevents an NDIS based Telnet application from concurrently using the same network card as AppleShare PC.

We don't know of any ODI compliant TCP/IP software that can coexist with AppleShare PC, but we'll submit this to product management as an enhancement request. We'll also submit it to Farallon product management, because they're now taking over the AppleShare PC product.

## HyperCard, FTP, and Telnet

Revised: 5/29/91  
Security: Everyone

HyperCard, FTP, and Telnet

=====

Article Created: 22 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Do you know of any XCMDs or XFCNs that use MacTCP or other TCP/IP drivers which let HyperCard do a Telnet or FTP session?

DISCUSSION -----

The HyperCard MacTCP Toolkit version 1.0 is available from APDA and provides the functionality that you want. Here is the description from the APDAlog:

This toolkit contains XCMDs and source code for using HyperCard with MacTCP. Included is a sample stack for reading "netnews" and a documentation stack. MacTCP is software that allows developers to create Macintosh applications for networking environments that use TCP/IP protocols, a widely used standard for networking heterogeneous systems.

We haven't heard of a stack that supports the Telnet protocol.

There is an FTP client stack, called HyperFTP, written by Douglas Hornig of Cornell University. The latest version is available for anonymous FTP download at [elroy.cit.cornell.edu](http://elroy.cit.cornell.edu) (128.253.232.14).

## A/UX: Printing to Serial LaserWriter Plus (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: Printing to Serial LaserWriter Plus (8/94)

=====

Article Created: 22 February 1991  
Article Reviewed/Updated: 25 August 1994

TOPIC -----

I have a Macintosh IIfx with 8MB of RAM and a 160MB hard drive running A/UX. I want to attach the Macintosh IIfx to a LaserWriter Plus and print to it serially using the printer port on the back of the Macintosh.

I've set the speed of the LaserWriter Plus to 9600bps, set up the print queue, enabled all relevant print daemons, and I've used the setport command to establish the speed of the printer port.

I've used a direct RS/232 cable (Hayes Modem Cable), 2 LocalTalk connectors, and 2 PhoneNET connectors, and I get the same results: the printer flashes its Ready lights, but never prints anything.

I made it work using AppleTalk. I've tried using the Enscript utility to establish direct communication with the print and am successful, but when I try to establish communication with the PostScript interpreter, I get garbage. Is this an A/UX issue or is it related to the serial ports of the Macintosh IIfx--or both?

DISCUSSION -----

We have never used a direct RS-232 cable (Hayes Modem Cable), 2 LocalTalk connector, and 2 PhoneNET connectors to connect a LaserWriter Plus to a Macintosh. For a direct connection of a Macintosh to a LaserWriter Plus, We recommend you use a Mini-DIN-8 Male to DB-9 Male cable (cable number 590-0551, Apple finished goods number M0196). Furthermore, to make sure the connection is working, you can use the "cu" command to verify it.

We are not quite sure what you mean by "established communication with the PostScript interpreter". To print a PostScript format file directly, the %! symbols must be the first two characters on the first line of the file so that the rest of the file will be treated as the PostScript format by

the PostScript printer.

DAL: Response Time Via Modem (11/94)

=====

Article Created: 22 February 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

Do you know what is the response time for a simple DAL query to the host through a 2400-baud modem?

Do you know what is the response time for a simple DAL query to the host through AppleTalk tunneling?

DISCUSSION -----

It is difficult to provide any hard number because the response time varies so much depending on the environment. There are a number factors that can affect response time:

- Network traffic
- Host CPU model and its current user load: lack of system resources like memory, disk space, and CPU power. Too many users trying to update or read the same records at the same time can cause locking problems.
- Condition of communications line
- Macintosh model
- Database brand
- Database design: Bad design can make finding or updating certain records take a long time.
- Operating system set up
- Programs

Additionally, a DAL query, though simple, can result in one or many records to be selected. Depending on the machine's host load, a 2400-baud connection will work. For DECnet tunneling, we recommend a line speed of 56K or faster to achieve reliability and good performance.

## MacX: How to Use It in a DECnet Environment (1/95)

Revised: 1/30/95  
Security: Everyone

MacX: How to Use It in a DECnet Environment (1/95)

Article Created: 22 February 1991  
Article Reviewed/Updated: 30 January 1995

TOPIC -----

Regarding the use of MacX in a DECnet environment:

- 1) A DECnet driver is needed for the CommToolBox.
- 2) This driver does a translation from TCP/IP to ADSP.
- 3) The driver is available only from DEC, as part of PATHWORKS.

DISCUSSION -----

- 1) You need a DECnet/Mac driver in the System Folder, and a DECnet Tool in the Communications Folder. There is also a DECnet Control CDEV, that shows DECnet traffic statistics, and allows turning Network State on or off.
- 2) The DECnet driver does not translate TCP/IP to ADSP. It uses DECnet protocol to communicate with the VAX host. Another tool, the AppleTalk-DECnet Connection Tool establishes a connection to a DECwindows application through the AppleTalk/DECnet Transport Gateway. This one uses ADSP connections.
- 3) The DECnet Connection Tool and driver are included with the PATHWORKS for Macintosh package. Alisa also stated that their TSSnet software supports MacX connection over DECnet. For contact information, search the Technical Info library under "Alisa."

## Accelerator Boards: Using Virtual Memory

Revised: 5/23/91  
Security: Everyone

Accelerator Boards: Using Virtual Memory

=====

Article Created: 25 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can I get virtual memory with 68000 machines and 68020 machines without a PMMU by adding a 68030 accelerator board? If so, are there any repercussions I should know about?

DISCUSSION -----

Yes, one way to get virtual memory with 68000 machines and 68020 machines without a PMMU is to add a 68030 accelerator board. Warning: adding a 68030 accelerator board to your 68000- or 68020-based system does not guarantee that one of the third-party virtual-memory products will support the upgrade you have added.

If virtual memory support is your goal, verify with the board manufacturer that their product works with your virtual-memory products. Likewise, check with the virtual-memory product's manufacturer to verify that their product works with your 68030 accelerator board.

Access II and Apple IIf Plus: No 40-Column Mode

=====

Article Created: 25 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am using an Apple IIf Plus and Apple Access II. The Volume Slide Control on the keyboard for the Apple IIf Plus replaces the 40- or 80-column mode switch found on the original Apple IIf.

Typing PR#3 for 80-column mode and PR#0 for 40-column mode works when in ProDOS, but when using Apple Access how can I switch between 40- and 80-column mode?

Aren't both 40- and 80-column modes supported in Apple Access II?

DISCUSSION -----

Apple Access II does not support 40-column mode on the Apple IIf Plus. The software detects that the 80-column mode is available and wants to switch the system into that mode. There is no workaround.

## MacX Manual: Availability of Copies

Revised: 4/20/93  
Security: Everyone

MacX Manual: Availability of Copies

=====

Article Created: 25 February 1991

### Article Change History

-----

04/20/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

We are considering the purchase of a site license for MacX, and we have a question about getting copies of the manual for our users. Is the manual for MacX available in electronic form? We would prefer to print copies on our LaserWriter instead of trying to duplicate the fuzzy hard copy that we have.

### DISCUSSION -----

As of February 1991, you can buy the MacX manual. This will be the only way to obtain the manual separately from the software. To respond further to your question:

- The manuals are not available in electronic form.
- They may not be legally copied.

Apple IIe/IIGS: Connecting to IBM Host via 3708

=====

Article Created: 25 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I would like to access an IBM host via an Apple IIe or Apple IIGS for services like PROFS. There is a 3708 in some way attached to the host, and I can log in with an emulator through this device. I'm having a problem with keyboard mapping (particularly the PF keys).

DISCUSSION -----

The 3708 is a protocol converter that converts, among other things, a terminal's ASCII character set to the host's EBCDIC character set. You don't mention what terminal emulator is being used on the Apple IIGS, but we suspect it is a VT52, VT100, or similar type of emulator.

Regardless, you'll need to verify that the terminal emulator type you are using is among those supported by the 3708. Check the "IBM 3708 Planning Manual" for the list of non-IBM ASCII display terminals it supports.

Even though terminal packages may not specifically state that they support IBM host communications and PF keys, many emulators can send the specific escape or command key sequences that are recognized and remapped by the controller into PF keys. For instance, Apple Access II's key sequence Esc-1 is remapped by many protocol converters to a PF1, an Esc-\$ to PF16, and so on.

When using a general-purpose terminal emulator, like a VT100 emulator, you need to identify which ASCII key sequences map to PF keys, after you satisfy the general connection requirements like handshaking issues. Check the 3708 documentation for the ASCII to EBCDIC mapping. To determine if an emulator will send the specific ASCII key sequences, check the emulator's manual or contact the manufacturer. You too could use a datascope analyzer

to determine what the appropriate character combinations are.

In terms of general information, the 3708 Network Conversion Unit is a ten-port, compact, desktop, protocol converter. It enables asynchronous ASCII terminals or personal computers with asynchronous ASCII communications capability to connect to and be compatible with one or multiple SNA host and non-SNA host systems. The user of an asynchronous ASCII terminal can access host applications that support 3270 displays and printers, Network Terminal Option devices, and applications that support the actual terminal type.

A/UX 2.0: Missing /dev File

=====

Article Created: 25 February 1991  
Article Reviewed/Updated: August 16 1993

TOPIC -----

After installing a brand new copy of A/UX 2.0, I've discovered that I'm missing a needed device file: /dev/dsk/c0d0s3.

I've used HDSetup to partition my internal HD160 SC drive (SCSI 0), and selected partitioning that would allow a 40MB Macintosh partition, Standard A/UX partitions, and the rest as "Unreserved 1" Slice 3. Without this device, I can't set up that final partition on my disk unless I repartition.

Is it possible to modify an existing device file to create this missing one? How would I do this?

DISCUSSION -----

The missing device file /dev/dsk/c0d0s3, for example, can be created by the "mknod" command:

```
mknod /dev/dsk/c0d0s3 b 24 3
chmod 600 /dev/dsk/c0d0s3
chown bin /dev/dsk/c0d0s3
chgrp bin /dev/dsk/c0d0s3
```

Note that 24 is the major device number, 3 is the minor device number for /dev/dsk/c0d0s3, and b indicates a block device type. Of course, you have to be "root" to do it.

The "pname" command seems to do the same thing. It will automatically create the file in the /dev/dsk directory, if c0d0s3 doesn't exist. In your case, for example, pname -c0 -s3 "Unreserved 1".

## A/UX 2.0: Input during Login Session

Revised: 8/17/93  
Security: Everyone

A/UX 2.0: Input during Login Session

=====

Article Created: 25 February 1991  
Article Reviewed/Updated: 31 June 1992

TOPIC -----

If I have something in my login file, like a question about setting the variable term with the A/UX login, I can answer but I can't see what I am typing. Is there a way to have a window with the question in it?

DISCUSSION -----

Since A/UX Finder 32-bit environment was selected as a default Login Session, and the Login process (not part of CommandShell process) was handled via the /mac/bin/mac32 process, all output messages (from .profile or .login or .cshrc or .kshrc file) are disabled by the mac32 environment. We know of this symptom.

There are, however, two ways that let you view and answer the question asked in the shell script: the "Console Emulator" Session and "Initial command" dialog box.

Console Emulator Session

-----

Use "Console Emulator" session. This lets regular UNIX input or output (usually specified in the .profile or .login or .cshrc or .kshrc file) be viewed on the Console display.

- 1) Select "Console Emulator" as the Session Type.
- 2) Login into Console Emulator mode. All the questions asked in the .profile or .login or .kshrc file will be displayed.
- 3) Issue the "mac32;screenrestore" or "mac24;screenrestore" command to go to Macintosh 32-bit or 24-bit environment.

Or you may insert the "mac32; screenrestore" or "mac24;screenrestore"

command at the end of your .profile or .login or .kshrc file to automatically go to MultiFinder environment.

- 4) Select "Logout" from MultiFinder environment to get back to the "Console Emulator" mode.
- 5) Issue the "exit" command from the "Console Emulator" mode to get back to the Login Dialog session.

#### The Initial Command

-----  
Use the "Initial command" dialog box from the "Active Window Settings" menu:

- 1) Within a CommandShell window, select the "Active Window Settings" item from the "Preferences" menu.
- 2) Put in any command you want to execute at log-in time into this window. For example:

```
sh /.cmdshrc
```

where /.cmdshrc is the shell script file to be executed as soon as you log into this window.

- 3) Click OK.
- 4) Select the "Save Preferences" item from the "File" menu to save the settings. The .cmdshellprefs file will be created in the user's home directory.

Aristotle Menu Setup Problem: Check Access Privileges (11/94)

=====

Article Created: 26 February 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

We are having problems with menu access using Aristotle. The server is a Macintosh SE/30 4/80, running the latest System software (GS/OS 5.0.2) and the proper Apple II Setup.

The menu setup that we are using lets two of the teachers have set their own menus up so that they can go into student menu Administration with a menu choice of their own. One teacher doesn't see that choice; he can only see his two classes. The other can't see one class, but sees administration.

What could be wrong in the setup?

DISCUSSION -----

The typical issue that causes this type of problem relates to folder access privileges.

The first teacher's access privileges are probably not set for access to the Menu Management program's folder, while the set for access to his two classes' folders. The second teacher's privileges seem to be set for access to the Menu Management's folder, while the class folder's access is probably not permitted. This has been the only way we have been able to duplicate the situation you describe.

Mac 'N Touch Touch-screen Monitor Works with HyperCard

=====

Article Created: 26 February 1991  
Article Reviewed/Updated: 5 June 1992

TOPIC -----

I am looking for a touch screen monitor that can be used with HyperCard.

DISCUSSION -----

MicroTouch, Inc. makes a low-cost touch screen monitor called Mac 'N Touch that works with nearly all Macintosh systems. It is based on the Magnavox 9CM080, which is capable of displaying up to 256 colors from a palette of more than 16 million with a resolution of 640 by 480. The monitor has a 14-inch display with a 0.25mm dot pitch. MicroTouch verified that their product does work with HyperCard.

To locate a vendor's address and phone numbers, use vendor name as a search string.

HyperCard 2.0: Sound Changes

=====

Article Created: 26 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have developed a "Vocal Communicator" stack that takes advantage of MacinTalk (Apple, Jan. 1 1983) and several XCMDs and XFCNs from HyperMacinTalk v1.0 (Copyright 1987, by Dennis C. DeMars). This stack worked perfectly on my Macintosh SE/30 under System 6.0.5 and HyperCard 1.2.5. With it, a mute person can answer questions and build sentences to be spoken aloud by the Macintosh. After I upgraded to HyperCard 2.0, all it would do was beep, or remain tied up and silent for the length of time that should have been spent "talking."

Is there something about HyperCard 2.0 that makes it incompatible with existing XCMDs or XFCNs?

DISCUSSION -----

HyperCard 2.0 has changed the way XCMDs and HyperCard interact when using the sound capabilities of the Macintosh. Specific callback procedures have been added that XCMDs (and XFCNs) can use to signal HyperCard when they want control of the Macintosh's sound channels. It is likely that XCMDs using sound will need to be modified to work properly with HyperCard 2.0.

Macintosh IIfx: Combining Parity and Non-Parity RAM

=====

Article Created: 26 January 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated:

TOPIC -----

Are there any compatibility issues with combining parity and non-parity RAM in a non-parity Macintosh IIfx?

DISCUSSION -----

Combining parity and non-parity RAM in a non-parity Macintosh IIfx should not be a problem as long as all the SIMMs in each SIMM bank are the same speed. We have seen some problems using SIMMs from different vendors in the same SIMM bank, even though they have the same speed. This is probably due to speed differences between the SIMMs.

## Macintosh Family: MIPS Ratings (10/96)

Revised: 10/23/96  
Security: Everyone

Macintosh Family: MIPS Ratings (10/96)

Article Created: 22 November 1991  
Article Reviewed/Updated: 23 October 1996

TOPIC -----

Are there any MIPS specifications for Apple hardware?

DISCUSSION -----

IMPORTANT: Resellers PLEASE include all disclaimers when passing this information to a customer.

Measuring MIPS is, at best, an inaccurate art. All the reference manuals we consulted stated that a MIPS rating can be misleading. MIPS (Million Instructions Per Second) is a measurement of CPU (Central Processing Unit) speed.

From Motorola's 68020/68030 Performance Report:

"Benchmarking microprocessors is much like water-witching. Everyone wants to use the results but are skeptical of the 900-methods. From the user's point of view, the best benchmark to use in making a decision on a given microprocessor is to run the code which will be run in the final application. This, however, is usually difficult at best, and expensive and time consuming at least. Since running the actual code is usually not feasible, most users and all microprocessor manufacturers turn to either synthetic benchmarks - ones that simulate real-world conditions - or small standard benchmark programs which are designed to indicate real-world performance. Not everyone can agree on what simulates real conditions; thus, there are numerous benchmark programs available, each written to test some aspect of performance that the writer is interested in testing."

Another issue that causes MIPS ratings to be suspect is that not all

instructions take the same amount of time. A single instruction can take from 2 to over 200 machine cycles. The MC68020, for example, runs at a sustained rate of 2 to 3 MIPS, with occasional bursts of 8 MIPS.

Several other factors may enter into the process of obtaining the MIPS rating:

- Instruction in cache and cache enabled
- Instruction data size
- Addressing mode used -- Extensions folder words and indirect
- Memory port size
- Memory speed -- variable wait states
- Operand misalignment
- Prefetch sequence -- even or odd, word alignment of op word
- Instruction overlap

If a program is written to test the MIPS, other issues surface:

- Which instruction is used? The best instruction to make the MIPS rating look good would be the fastest executing instruction in the CPU set.
- What is the best program structure to use? Two choices, a loop or a straight line. A straight line program will take more space but is, by far, the fastest. The straight line program executes only the fast instructions without executing any looping instructions.

For these reasons, Apple hasn't published MIPS ratings. However, the press has designated some ratings for our products. Using their formula

$$\text{MIPS} = \text{MHz} / \text{ICC} / \text{Memd} \\ (\text{clock speed} / \text{instruction cycle count} / \text{memory system delay})$$

provides the following MIPS ratings:

|                         |     |     |     |
|-------------------------|-----|-----|-----|
| Macintosh Classic       | 0.7 |     |     |

Power Macintosh computers: IBM and Motorola do not publish MIPS ratings for the PowerPC line of processors. Instead, they have adopted the SPEC benchmark suites to evaluate their PowerPC processors. This information is available in the Tech Info Library using the search string "SPEC ratings and PowerPC" to locate the following articles:

PowerPC: SPEC ratings for 604 & 620 chips

PowerPC: SPEC ratings for 604 & 620 chips

PowerPC: SPEC ratings for 601, 601+, and 602

For additional information about SPEC ratings, access the SPEC Web site at <http://www.specbench.org/>. For information about PowerPC processors, contact Motorola at <http://www.mot.com/SPS/PowerPC/> or IBM at <http://www.chips.ibm.com/products/ppc/index.html>.

\* NOTE: The majority of our systems operate with a variable number of wait states. See the Tech Info article on Wait States and Macintosh. The article is titled: "RAM Speed and CPU Speed: How They're Related".

\*\* NOTE: This figure has been adjusted to reflect the improved efficiency of the 68020, 68030, and 68040.

\*\*\* NOTE: This figure doesn't reflect performance degradation due to the use of internal video, or increases provided by an optional cache card.

\*\*\*\* NOTE: Rating from Motorola.

Using variable wait states, the rating for the Macintosh IIx could be anywhere from 3.3 to 10 MIPS. The values shown above are based on nominal wait states of 2 for each computer.

Again, we stress that MIPS calculation is very misleading. Any presentation of these numbers should be accompanied by a disclaimer.

#### Article Change History:

22 Oct 1996 - Added SPEC ratings information.

31 May 1994 - Included title of wait state article.

29 Mar 1994 - Updated to include ratings for numerous Macintosh and Performa models.

Mitsubishi 37-inch Monitor: How to Use it with Macintosh SE/30

=====

Article Created: 22 February 1991

### Article Change History

-----

02/09/93 - UPDATED

- Micron Technology acquired by Xceed Technologies.

### TOPIC -----

I would like to be able to display the image from a Macintosh SE/30 to a "Mitsubishi 37-inch monitor. Can this be done?

### DISCUSSION -----

For a Macintosh SE/30 to connect to this monitor, you need a video card and a video cable.

There are several color video cards that fit the Macintosh SE/30's processor direct slot. One of these cards will need to be installed. Among the cards available are RasterOps' ColorBoard 108+/SE30 & ColorBoard 264, Xceed Technologies' Xceed SE/306-48 & Xceed SE/3010-78 and Spark's Color Video Card.

Mitsubishi markets a cable that will connect between the card output connector and the monitor input connector. The cable is available from Mitsubishi's authorized retail outlets. For the name of an authorized dealer, contact one of Mitsubishi's distributors.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Macintosh Portable: Modem Switches Explained

=====

Article Created: 6 February 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can you tell me what the switches on the Portable modem are used for?

DISCUSSION -----

You localize the Macintosh Portable Modem through the use of an external line adapter (DAA) that plugs into the generic modem board (installed through the back panel).

There is a different DAA whose hardware complies with the different country regulations and which identifies itself to the main board, thereby enabling country-compliant pieces of firmware to control the modem ("automatic communication parameters configuration").

So, the purpose of the two switches is to provide four adjustable transmit levels. They are set in the same position at the factory for all countries. Transmitted levels comply with each country's regulation.

Macintosh Portable: External Video Adapter Canceled (6/96)

=====

Article Created: 19 February 1991  
Article Reviewed/Updated: 5 June 1996

TOPIC -----

Whatever happened to the promised Macintosh Portable video adapter?

DISCUSSION -----

In September of 1989, when Apple introduced the Macintosh Portable, Apple announced they intended to ship a video adapter which would let users take advantage of external displays.

Since that time, a variety of developers have introduced products which provide the external video functionality customers require. For that reason, Apple decided not to offer a video adapter.

Customers in need of external video support have a wide range of products to choose from, including:

- Sayett Technology's DataShow, an overhead viewplate that connects directly to the Portable's Video Out port
- Aura System's ScuzzyGraph II, which enables customers to use the Macintosh Portable with a color monitor
- Generation Systems' Portable Publisher, which lets Portable users take advantage of the Apple High Resolution Monochrome Monitor, Portrait Display, and Two-Page Display.

The above is a sample of the products and capabilities currently available to Macintosh Portable customers, and we anticipate other third-party video product announcements.

This article provides information about a non-Apple product. Apple Computer,

Inc. is not responsible for its content. Please contact the vendor for additional information.

## System 7: Editing a Subscriber

Revised: 9/22/92  
Security: Everyone

System 7: Editing a Subscriber

=====

Article Created: 7 March 1991

### Article Change History

-----

09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Can I edit a subscriber?

### DISCUSSION -----

Not generally. A subscriber is a copy of data that was published by another document. The published material stays in the original document.

There are two ways to change the data you see in the subscriber. You can either edit the original data in the publisher, or break the connection between the publisher and the subscriber. Breaking the connection leaves an editable copy of the data in the subscribing document.

To edit the original data, follow these steps:

- 1) Select the subscriber.
- 2) Choose "Subscriber Options..." from the Edit menu.
- 3) Click the "Open Publisher" button

To break the connection, follow these steps:

- 1) Select the subscriber.

2) Choose "Subscriber Options..." from the Edit menu.

3) Click the "Cancel Subscriber" button.

Once you break the connection, the subscriber is no longer automatically updated when the publisher is changed.

## Macintosh IIfx and IIfx: New 3.5-Inch 160MB SCSI Hard Drive

Revised: 5/20/91  
Security: Everyone

Macintosh IIfx and IIfx: New 3.5-Inch 160MB SCSI Hard Drive

Article Created: 11 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Apple is now using a new 3.5-inch 160MB SCSI hard disk drive mechanism as an optional component in the Macintosh IIfx and Macintosh IIfx. (It is not a separate product.) Here are the technical specifications for this drive mechanism.

DISCUSSION -----

### Capacity

-----

|                          |           |
|--------------------------|-----------|
| Formatted data capacity: | 160MB     |
| Data surfaces:           | 8         |
| Heads per surface:       | 1         |
| Block size:              | 512 bytes |
| Total disk blocks:       | 327,780   |
| Sectors per track:       | 39        |

### Characteristics

-----

|                      |                                     |
|----------------------|-------------------------------------|
| Average access time: | 16 milliseconds, including settling |
| Transfer rate:       | up to 1.5MB/sec (CPU/bus dependent) |
| Rotation speed:      | 3,600 RPM                           |
| Startup:             | <20 seconds                         |
| Spindown:            | <20 seconds                         |

### Physical

-----

|              |                                     |
|--------------|-------------------------------------|
| Form Factor: | 3.5-inch, half height               |
| Weight:      | 0.85 kg (30 ounces) without carrier |
| Size:        | 150 x 102 x 42 millimeters          |

Miscellaneous

-----

Encoding method: 2,7 RLL (Run-Length Limited)  
Servo mechanism: Embedded sector servo  
Actuator type: Balanced Rotary Voice Coil  
Landing zone: Dedicated (i.e. not on data)  
Head Park and Lock: The actuator automatically parks and locks in the  
landing zone at power down  
Mounting: Any mounting orientation is supported

Environmental

-----

Exceeds all Macintosh CPU environmental  
specifications (operating and non-operating  
temperature, humidity, altitude, vibration and shock).

Safety

-----

UL, CSA and TUV certified

## Network Troubleshooting: Symptoms & Causes (4/94)

Revised: 4/13/94  
Security: Everyone

Network Troubleshooting: Symptoms & Causes (4/94)

=====

Article Created: May 16, 1991  
Article Reviewed/Updated: 13 April 1994

TOPIC -----

Troubleshooting a network can be much more difficult than troubleshooting a single piece of equipment. This is because many devices might be involved. Because of this, you should use a systematic approach to isolating and resolving the problem.

DISCUSSION -----

Below is a list of possible symptom/cures to be referenced when troubleshooting network problems. The list is based on LocalTalk, Ethernet, Token Ring, and Star networks--but can be adapted to other topologies. If you are a service provider, additional information can be found in Apple Technical Procedures. In addition, there are other articles in the Tech Info Library that may assist you.

### Missing Device Problems

-----

#### Symptoms:

- Can't access file server.
- Can't access printer.
- Can't access another zone on the network.
- Can't access another network.

#### Possible causes:

- Break in connector.
- Broken or damaged pins on connector box.
- Device turned off.
- Cables severed or damaged.
- Disconnected cable extenders.
- Network interface card damaged, missing, or not installed properly.
- System software versions not consistent across the network.
- Incorrect printer or other device drivers.

Appropriate cdev and/or adev missing or not in System folder.

Token Ring:

MAU not connected.

Bad MAU port.

Ring In/Ring Out bad or not connected.

STAR:

Star Controller turned off, not plugged in or is malfunctioning.

Wires not punched down or punched down correctly.

Punchdown block not connected to Star Controller.

#### Ghosting Problems

-----

Symptoms:

Network device appears and disappears in the Chooser.

Possible causes:

Loose connector.

Damaged or obstructed cable.

Improper termination.

Loose cable extenders.

Maximum cable length exceeded (check user manual).

Maximum number of nodes exceeded.

Electro-magnetic interference.

Network not designed properly.

#### Performance Degradation

-----

Symptoms:

Slow printing

Slow file transfer

Network appears to be dead.

Possible causes:

Maximum number of nodes exceeded.

Excessive traffic.

System software versions not consistent across the network.

Virus.

#### File Folder Access

-----

Symptoms:

Can't see files or folders.

Can't open files or folders.

Can't drop files or folders into drop folder.

Can't change file or folder name.

Can't move file or folder.

Possible causes:

Access privileges set incorrectly.  
Files or folders locked.

## HyperCard: Converting Stacks Macintosh <—> Apple IIGS (5/91)

Revised: 12/21/93  
Security: Everyone

HyperCard: Converting Stacks Macintosh <—> Apple IIGS (5/91)

Article Created: 13 May 1991

TOPIC -----

This article describes HyperMover 1.1, a software tool for converting stacks between Macintosh HyperCard and HyperCard IIGS.

DISCUSSION -----

Because of the differences between the Macintosh and the Apple IIGS, stacks created on one computer do not run directly on the other. HyperMover makes it easier and faster to convert stacks between the Macintosh and the Apple IIGS. HyperMover will be available from user groups and on-line services.

HyperMover 1.1 includes two stacks: Macintosh HyperMover and HyperMover IIGS.

### MACINTOSH HYPERMOVER

Macintosh HyperMover analyzes a Macintosh HyperCard stack, then creates a folder containing information that HyperMover IIGS can use to create an equivalent stack for use on the Apple IIGS.

- HyperMover works on all Macintosh models capable of running HyperCard. It requires HyperCard 1.2.5, or HyperCard 2.0v2 or later.
- HyperMover may require up to 2MB RAM to dismantle or rebuild stacks. If you are running HyperCard under MultiFinder, allocate at least 1600K to HyperCard. Large stacks with many objects or sounds may require more memory.
- Disk space: HyperMover needs 1.5 to 5 times the size of the original stack.

## HYPERMOVER IIGS

-----

HyperMover IIGS analyzes a HyperCard IIGS stack, then creates a folder containing information that Macintosh HyperMover can use to create an equivalent stack for use on the Macintosh.

HyperMover IIGS requires:

- HyperCard IIGS 1.0 or later.
- System Software 5.0.4. or later.
- IIGS ROM 01 and ROM 03.
- 1.5MB RAM for small stacks, 2MB for most stacks.
- Disk space: 1.5 to 5 times the size of the original stack. In general, Macintosh stacks rebuilt on the Apple IIGS will be slightly larger than the original stack, because HyperCard IIGS supports color paint, which takes up more disk space.

## TRANSFERRING THE FILES

-----

After dismantling a stack, you must transfer the files HyperMover creates. This can be done either with Apple File Exchange or an AppleTalk network.

If you use a network, both the Macintosh and the Apple IIGS must be physically connected and logged on to a common server. Simply drag the folder that HyperMover created on one computer to a location on the server that you can also access from the other computer.

If you use Apple File Exchange, you must format as many disks as needed to contain the converted files. After formatting the necessary number of disks, use Apple File Exchange to transfer the folder containing the converted files. The files can be transferred in two or more groups if the contents of the folder total more than 800K and are combined into one folder.

When converting from Macintosh to Apple IIGS, the text file with the same name as the dismantled stack may not be a legal ProDOS filename; if this is the case, simply rename the file to a legal filename. Do not rename any of the other files in the folder.

## DIFFERENCES BETWEEN STACKS

-----

Because the Apple IIGS and Macintosh differ significantly in hardware, some aspects of a converted stack will not be identical to the original. HyperMover will pre-scan the original stack and warn the user of features, such as XCMDs and XFCNs, that will not be converted.

## Graphics

-----

The most noticeable difference between the original and the rebuilt stack will be in the graphics. The Apple IIGS and the Macintosh have different screen sizes (320x200, 4-bits per pixel; and 512x342, 1-bit per pixel). Therefore, graphics moved between the two systems need to be modified to fit and display properly.

This is handled by HyperMover in several ways:

- Macintosh graphics to the Apple IIGS. HyperMover contains two algorithms for scaling graphics from Macintosh to Apple IIGS screen resolution. The first routine is best used for line-art. The second is preferable for heavily dithered graphics such as those created with HyperScan.
- Apple IIGS graphics to the Macintosh. Moving graphics this direction involves reducing the number of colors available per pixel from sixteen (Apple IIGS) to black-and-white (Macintosh). At the same time, however, the picture must be scaled up from 320x200 to 512x342. This results in more pixels being available to simulate the colors lost during dithering.

## Screen Coordinates

-----

Just as pictures must be scaled to fit the destination card size, buttons and fields must also be scaled so that they appear in the correct locations on the destination card. However, buttons and fields are objects and can be scaled with no distortion.

## Scripts

-----

Because of the differing screen sizes, scripts converted from one system to the other will require modification to function properly if they rely on specific screen coordinates.

Scripts that rely on features specific to one system, such as the color properties of HyperCard IIGS or specific commands in Macintosh HyperCard 2.0, will also need to be modified to work correctly.

## Animation Sequences

-----

Animation sequences that use system icons and refer to them by ID will need to be modified after the stack is converted.

## Machine-Specific Properties

-----

Properties specific to HyperCard IIGS, such as button families and sharedText on the Apple IIGS will not be preserved in stacks converted to HyperCard 1.2.5. Conversion of HyperCard IIGS to HyperCard 2.0 will retain those properties that are common to HyperCard 2.0 and HyperCard IIGS.

Similarly, varying card sizes in HyperCard 2.0 will not be preserved in

stacks converted to HyperCard IIGS.

#### WHAT HYPERMOVER CAN AND CANNOT DO

-----

HyperMover can:

- Create scaled representations of pictures.
- Convert Macintosh sounds to Apple IIGS sounds, and vice versa.
- Transfer all HyperCard objects--including backgrounds, cards, buttons, and fields, and their attributes.
- Convert and scale Macintosh icons and cursors to Apple IIGS icons and cursors.

HyperMover cannot:

- Convert external commands and functions (XCMDs and XFCNs).
- Fix scripts that depend on specific screen coordinates.
- Alter scripts that rely on features specific to one machine.
- Maintain the ordering of buttons in relation to fields.

## Disk III: Specifications (Discontinued)

Revised: 9/15/93  
Security: Everyone

Disk III: Specifications (Discontinued)

Article Created: 1 May 1991

TOPIC -----

This article gives specifications for the Disk III product.

DISCUSSION -----

Technical Specifications

Format

-----

- Sectoring: Soft (hard-sectored disks may be used)
- Recording Surfaces: 1
- Tracks per surface: 35
- Sectors per track: 16
- Bytes per sector: 256

Capacity

-----

- Formatted data capacity: 143K
  - 16 sector
  - Under: SOS

Characteristics

-----

- Head movement time:
  - 25 milliseconds track to track
  - 600 milliseconds across all tracks
- Head load time: 50 milliseconds

# ..TIL07086-Disk\_III-Specifications\_Discontinued.pdf

- Average rotational delay: 100 milliseconds
- Drive dimensions:

|         | inches | centimeters |
|---------|--------|-------------|
| Height: | 4.12   | 10.5        |
| Width:  | 6.25   | 15.9        |
| Depth:  | 8.75   | 22.3        |
|         | pounds | kilograms   |
| Weight: | 4.49   | 2.03        |
- Power source for drives: Apple system power supply

## System Configuration

Apple III, Apple III Plus (with adapter)

- 
- Recommended minimum memory: 128K

## Non-Postscript Printers: Solution to Printing Large Characters

Revised: 5/24/91  
Security: Everyone

Non-Postscript Printers: Solution to Printing Large Characters

=====

Article Created: 1 April 1991  
Article Last Reviewed: 23 May 1991  
Article Last Updated: 23 May 1991

TOPIC -----

I'm having a problem writing large characters on a Personal LaserWriter SC. Printed characters larger than 18 point are being cut off near the bottom. For example, if an "f" is printed, most of the part below the crossbar is missing.

DISCUSSION -----

The Personal LaserWriter SC suffers from the same problem as the LaserWriter IISC and the ImageWriter LQ: when printing outline, bold and shadow text in 18 point or larger type sizes, some parts of the characters may be omitted and/or garbled. The problem usually occurs when 4X fonts are used. Installing more system RAM and/or allocating more memory to the application will have no effect on the problem.

In March of 1991, this problem is fixed by using TrueType-compatible printer drivers. Apple introduced the TrueType font scaling software which is bundled with both the StyleWriter and the Personal LaserWriter LS printers. The TrueType compatible drivers are available on a Macintosh Printing Tools disk which contains the drivers for the following printers:

| Printer<br>-----           | Version<br>----- |
|----------------------------|------------------|
| LaserWriter                | 6.1              |
| ImageWriter                | 6.1              |
| AppleTalk ImageWriter      | 6.1              |
| Personal LaserWriter SC    | 6.1              |
| Personal LaserWriter LS    | 1.0              |
| ImageWriter LQ ImageWriter | 6.1              |

|                                      |     |
|--------------------------------------|-----|
| ImageWriter LQ AppleTalk ImageWriter | 6.1 |
| StyleWriter                          | 1.0 |

In May of 1991 another solution was made available with the release of System 7. System 7 includes a new Printing disk and Tidbit disk which contain printer drivers for the following:

| Printer                  | Version |
|--------------------------|---------|
| -----                    | -----   |
| LaserWriter              | 7.0     |
| Personal LaserWriter SC  | 7.0     |
| ImageWriter              | 7.0     |
| AppleTalk ImageWriter    | 7.0     |
| LQ ImageWriter           | 7.0     |
| LQ AppleTalk ImageWriter | 7.0     |

## Macintosh LC: Connecting to VGA Monitors

Revised: 7/23/92  
Security: Everyone

Macintosh LC: Connecting to VGA Monitors

Article Created: 5 March 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated: 23 July 1992

TOPIC -----

Does the Macintosh LC support VGA monitors? What are the pinouts for connecting a VGA monitor to a Macintosh LC?

DISCUSSION -----

The Macintosh LC supports some VGA monitors. However, there are many different modes/types of VGA timing. The following specifications show the VGA timing characteristics supported by the Macintosh LC.

|            |               |
|------------|---------------|
| Dot clock  | = 25.175 MHz  |
| Dot        | = 39.722 nsec |
| Full line  | = 31.778 usec |
| Line rate  | = 31.469 kHz  |
| Full frame | = 16.68 msec  |
| Frame rate | = 59.94 Hz    |

Here are the pinouts for connecting a VGA monitor to a Macintosh LC:

| Macintosh LC |                    | VGA Connector |
|--------------|--------------------|---------------|
| DB-15        |                    |               |
| -----        |                    | -----         |
| 2            | ----- Red Video    | 1             |
| 1            | ----- Red Ground   | 6             |
| 9            | ----- Blue Video   | 3             |
| 13           | ----- Blue Ground  | 8             |
| 5            | ----- Green Video  | 2             |
| 6            | ----- Green Ground | 7             |
| 15           | ----- Hsync        | 13            |

```
12 ----- Vsync ----- 14
14 ----- Sync Ground ----- 10
10 -----|
7 -----| Connect 7 and 10 so the sense pin ID will equal VGA
```

A few issues to keep in mind:

- VGA monitors may vary depending on the vendor. Check with the vendor about Macintosh LC compatibility before buying.
- Vendors have different image quality specifications. There may significant differences between Apple monitors and VGA monitors. Do a side-by-side comparison of a VGA monitor with an Apple monitor before buying.
- Third party cable vendors should have cables available for purchase soon.
- When a VGA monitor is connected as described in the pinout above, the resolution is 640 x 480. The bit-depth supported depends on the amount of VRAM installed. For example, if the Macintosh LC 256K VRAM SIMM is installed, 4-bit color (16 colors) is supported. If the Macintosh LC 512K VRAM SIMM is installed, 8-bit (256 colors) is supported.

## System 7: Hardware and Memory Requirements

Revised: 9/18/92  
Security: Everyone

System 7: Hardware and Memory Requirements

Article Created: 1 May 1991

### Article Change History

-----  
09/16/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What hardware do I need to run System 7?

### DISCUSSION -----

System 7.0 runs on all Macintosh computers with 2MB of RAM and a hard drive. If you have a Macintosh with a 68030 microprocessor (or a 68020 with a PMMU), you can also take advantage of virtual memory (VM).

On a 2MB Macintosh running System 7.0, you have enough RAM (750K to 1024K) to run one moderate-size application like a word processor or spreadsheet. With a 2MB Macintosh SE running System 7:

- You always have access to the desktop
- You can use most of the features of System 7
- You have about the same amount of memory for applications as you did under System 6 with 1MB of RAM.

Further, a System 7 Macintosh is as fast as a System 6 Macintosh SE, and even faster in many important operations like copying files.

Note: Turning file sharing on reduces memory available for applications by about 200K. Using on-board video on a Macintosh IIx and Macintosh IIfx can consume over 300K of memory when the monitor is set to 8-bit color.

How you use your Macintosh computer affects how much memory you will need. This makes it difficult to make a memory recommendation for a particular user.

Taking advantage of other specific features of System 7 may require other hardware like a network, color monitor, and so on.

### TOPIC -----

Must I buy a System 7 upgrade kit or can a dealer copy the disks for me?

### DISCUSSION -----

System 7 offers so many new features and capabilities that many users will want to have the System 7 User's Guides and the information offered in the System 7 Upgrade Kits. These kits include Macintosh System Software 7, reference manuals, and many extra features.

However, as in the past, some dealers may make new versions of System Software available to customers by duplicating the software onto the customer's disks.

System Software 7 is also available through users groups, electronic bulletin boards, individuals, and AppleLink.

## System 7: File Sharing on a Large Network

Revised: 9/4/92  
Security: Everyone

System 7: File Sharing on a Large Network

=====

Article Created: 9 May 1991

### Article Change History

-----

09/04/92 - REVIEWED

- For accuracy and edited.

### TOPIC -----

How do I manage file sharing on a large network?

### DISCUSSION -----

File sharing is managed by each Macintosh user who has enabled it. Management involves all users naming their Macintosh computers with the Sharing Setup control panel, creating users and groups with which to share (if desired), and controlling access to the shared folders. The individual file sharing user performs these tasks.

It's a good idea for each network administrator to give each user guidelines regarding naming conventions and setting appropriate access privileges for sharing information.

## System 7 Decides Among Bitmap, TrueType, and ATM Fonts (10/96)

Revised: 10/3/96  
Security: Everyone

System 7 Decides Among Bitmap, TrueType, and ATM Fonts (10/96)

Article Created: 31 May 1991  
Article Reviewed/Updated: 3 October 1996

TOPIC -----

This document provides information about how System 7.x decides which font to use when different types of the same font family are installed.

DISCUSSION -----

For this discussion, assume that you have:

- Bitmap Times 24.
- TrueType Times (in any size).
- An Adobe Type Manager (ATM) Times (in any size).

Screen Fonts

=====

When you choose a font and size, the system uses the following order to decide among the possibilities for displaying type on the screen:

- 1) The bitmap font.
- 2) The TrueType font.
- 3) An Adobe Type Manager (ATM) font if available.
- 4) A bitmap font of a different size, to be scaled to the specified size.

This sequence means that the document you created in bitmap Times 24 will show up in the same bitmap font on the screen to ensure against reformatting. The system looks for the bitmap font first, and if it isn't available, it scales the TrueType font to the proper size.

## PostScript Printer Fonts

=====

When you print your document, the preference order changes. For type on a PostScript printer (such as a LaserWriter Plus, LaserWriter IINT, IINTX, IIf, IIg, LaserWriter Pro, Personal LaserWriter NT, NTR, LaserWriter Select 310, and many third-party PostScript laser printers), the order is:

- 1) The printer's ROM
- 2) The printer's RAM
- 3) The printer's hard disk
- 4) Type 1 or Type 3 PostScript files in the System Folder (stored inside the Extensions folder in System 7.0 and inside the Fonts folder in System 7.1 or later)
- 5) TrueType
- 6) Bitmap

## Detailed Information on How a PostScript Printer Determines Font Type

-----

When a job is being processed and when a font is called for in the job, the font is selected using the arbitration scheme described above, and the bitmap is built and cached in the printer's VM (RAM).

If the same font is called again later in the job, then this font in RAM is used unless it was purged by the interpreter to free up room for some other activity, such as to make room to build another font called for in the job. When the job is completed, the VM is flushed. The next job then goes through the same font arbitration process described above, until the bitmap is built in the printer's VM. As long as the font is resident in VM it is used during the course of that job.

Fonts downloaded by a utility or by some other means having the same name as a font in ROM will not be used. To download a font for print jobs to call and use, it must have a unique name. There are some third-party font applications which allow you to change the name of the font. Simply renaming the font in the Mac OS does NOT change the font name. All Apple PostScript printers and most third-party PostScript laser printers manage font arbitration similarly.

## Non-PostScript Printer and Fax Fonts

=====

For printing to a non-PostScript device (such as an ImageWriter, LaserWriter IISC, Personal LaserWriter SC or LS, LaserWriter Select 300, Personal LaserWriter 300, StyleWriter, StyleWriter II, the DeskWriter by Hewlett-Packard, fax modems, and so on) the order is:

- 1) TrueType

2) ATM (if available)

3) A bitmap font of a different size, scaled to the specified size

Adobe Type Manager (ATM) is a utility that generates bitmap fonts for any size and resolution from Type 1 PostScript fonts. Since TrueType fonts are not PostScript, Adobe Type Manager cannot manipulate them. ATM and TrueType can work side-by-side in your system. If you have some PostScript fonts to display and print using ATM, and you have different fonts in the TrueType format, you should have no problems.

However, keeping the same fonts installed in both ATM and TrueType formats is not recommended. Because of the order of precedence (TrueType over ATM on screen and on non-PostScript printers), if you have the same font installed in both formats, the system uses TrueType -- not ATM.

#### System 7 Installed Fonts

=====

The System 7 Installer automatically installs TrueType versions of Times, Helvetica, Courier, Symbol, Monaco, Geneva, and Chicago. If you need to use an ATM version of these fonts, you must remove the TrueType version from the System file (in System 7.0 or earlier) or from within the Fonts folder in the System Folder (in System 7.1 or later).

## System 7: How to Prepare for It

Revised: 9/14/92  
Security: Everyone

System 7: How to Prepare for It

=====

Article Created: 9 May 1991

### Article Change History

-----

08/24/92 - REVISED

- To provide additional, clearer information.

### TOPIC -----

What should I do to prepare for System 7?

### DISCUSSION -----

Apple recommends that you do the following things to prepare for System 7:

- 1) "Before You Install System 7" is in the Personal Upgrade Kit and the Group Upgrade kit. This stack describes features of System 7 and answers questions about upgrading.

Use the System 7 "Compatibility Checker" (a HyperCard stack), which scans your hard disk, checking the compatibility of your third-party applications, Control Panels (cdevs), and system extensions (INITs) against a database of compatibility information provided by the developers of the software. For the most up-to-date information, call the individual vendors of the software applications you use.

- 2) Upgrade to compatible versions of your application software.
- 3) Make sure you have enough RAM in your Macintosh (2MB is the absolute minimum; 4MB is strongly recommended) and that you have enough free space on your hard drive (at least 5MB).
- 4) If you use EtherTalk, upgrade your routers and EtherTalk drivers to

Phase II.

For more information on the Compatibility Checker, search for "Compatibility Checker".

## System 7: About the Compatibility Checker

Revised: 9/2/92  
Security: Everyone

System 7: About the Compatibility Checker

=====

Article Created: 9 May 1991

### Article Change History

-----

09/02/92 - REVISED

- With additional information about Compatibility Checker accuracy.

### TOPIC -----

What is the Compatibility Checker?

### DISCUSSION -----

The System 7 Compatibility Checker is a HyperCard stack that scans your hard disk, or any other startup disk, checking the compatibility of third-party:

- Applications
- Startup documents (INITs), known in System 7 as system extensions
- Control Panel documents (cdevs)
- Chooser selectable devices (rdevs)

All compatibility information used by the Compatibility Checker came from the developers of the products. You should use the Compatibility Checker before upgrading to System 7; you can use it afterward as well. Before using it, however, be sure to check the version and date of the Compatibility Checker itself. If it is out of date, the report it gives you will not contain accurate information about the third-party software on your disk. For instance, if you have just purchased a new version of a spreadsheet application, Compatibility Checker will be unaware of this version and will report it as incompatible. For the most recent possible information, it is best to contact the vendors of your software directly.

TOPIC -----

What is the recommended System 7 upgrade strategy for groups of Macintosh computers?

DISCUSSION -----

Apple's recommended upgrade strategy for groups of Macintosh computers is contained in the System 7 Group Upgrade Guide. This guide is an integral part of the System 7 Group Upgrade Kit. The kit contains all the tools and necessary information on how to plan, implement, and manage a group transition to System 7. This kit contains System 7 software and other software on disks and on a CD-ROM.

Network administrators and users who support a group of Macintosh computers should buy the System 7 Group Upgrade Kit (Order #M8221LL/A):

### Manuals

-----

System 7: Group Upgrade Guide  
What's New in System 7  
Macintosh Reference  
Macintosh Networking Reference  
HyperCard Basics 2.1

### Disks

-----

System 7 CD-ROM  
System Software 7, eight 800K disks  
Before You Install, one 800K disk  
HyperCard 2.1, two 800K disks

System 7: Moving Documents from System 6 to System 7

=====

Article Created: 10 May 1991

### Article Change History

-----

08/24/92 - REVISED

- To give additional information.

### TOPIC -----

Can I move documents from my System 6 Macintosh to a Macintosh running System 7? Will my documents change?

### DISCUSSION -----

You can move documents between a Macintosh running System 6 and a Macintosh running System 7 without any problems. In most cases, your documents will not change their appearance. For example, if your document uses Times font in size 12, your document won't change.

An exception occurs when you have TrueType fonts installed and you have documents using numerous odd type sizes. Line endings for such documents may change slightly when you open the document under System 7. Also, the document's formatting may be slightly different. You may need to readjust your document's formatting to have the format for lines and paragraphs appear exactly as before. This happens because the substituted TrueType fonts are more accurate and true to the printed output you'll get. But if you want the document to look exactly like it did under System 6, just remove the TrueType fonts from your System file. They are the ones with the triple "A" in the icon which display three different sizes when you double-click on them.

## System 7: How to Quit from an Application That Hangs

Revised: 5/31/91  
Security: Everyone

System 7: How to Quit from an Application That Hangs

=====

Article Created: 10 May 1991

### Article Change History

-----

08/19/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Under System 7, how do I force a hung application to quit?

### DISCUSSION -----

Built into System 7 is the ability to force an application to terminate. To do this, simultaneously press the Command, Option, and Escape keys. This feature should be used with extreme caution. You should definitely not rely on this as a usual way to quit an application.

It is particularly useful in the event that you have unsaved work in other applications when your current application hangs. By using this "force quit" feature, you can return to the Finder and save the work in your other applications. But because of possible corrupted memory after force quitting an application, you should restart your computer after using this feature.

## TrueType: How to Use with System 6 (8/94)

Revised: 8/22/94  
Security: Everyone

TrueType: How to Use with System 6 (8/94)

Article Created: 10 May 1991  
Article Reviewed/Updated: 22 August 1994

TOPIC -----

Can I use TrueType with System 6?

DISCUSSION -----

The TrueType Disk Set (INIT plus fonts and drivers) is no longer available. However there are some additional sources for the TrueType Init needed for System 6. The TrueType init comes with the following printer software:

- LaserWriter Select 300 - TrueType Init is on Disk 2 Printer Software.
- Personal LaserWriter 300 - TrueType Init is compressed. Use Installer.
- Personal LaserWriter 320 - TrueType Init is compressed. Use Installer.
- StyleWriter - TrueType Init is on StyleWriter Installation Disk 1.
- StyleWriter II - TrueType Init is on Disk 2 Printer Software.

If you know someone who has the TrueType Disk set disks, you can also install them to get TrueType functionality with a System 6 machine.

Your Macintosh must have at least 1 MB of RAM and system software version 6.0.7 or later. Although the TrueType software works on System 6.0.5, Apple hasn't thoroughly tested it under 6.0.5. Therefore, we recommend you upgrade to System 6.0.7 or later. System 7.0 users don't need to install this software because the TrueType functionality is built into System 7.

The TrueType INIT goes into the root level of the System Folder. The fonts need to be installed using the Font/DA mover found on Disk 1 (version 4.1)

Full installation instructions can be found in the ReadMe file on Disk 1.

The TrueType Disk Set includes:

Disk 1 "TrueType Fonts & Software" (686K)

-----  
TrueType INIT  
TrueType fonts (13 type styles)  
Font/DA Mover v4.1  
ReadMe file (installation instructions, plus printer ReadMe notes)  
TeachText

Disk 2 "TrueType Printing Tools" (753K)  
-----

ImageWriter v6.1  
AppleTalk ImageWriter v6.1  
ImageWriter LQ v6.1  
AppleTalk ImageWriter LQ v6.1  
LaserWriter software (folder)  
    LaserWriter v6.1  
    Backgrounder  
    PrintMonitor  
    Personal LaserWriter SC v6.1  
Utilities (folder)  
    LaserWriter Font Utility  
    Laser Prep  
    About Laser Prep (ReadMe file)

Article Change History:

22 Aug 1994 - Added listing of specific diskettes for TrueType Init.  
27 Jul 1994 - Added additional sources for the TrueType Init.  
20 May 1994 - Detailed where the items go on a System 6 system.  
3 Nov 1993 - Stated that the disk set is no longer available.

## System 7: Preparing an Apple Hard Drive for Virtual Memory 6/95

Revised: 6/1/95  
Security: Everyone

System 7: Preparing an Apple Hard Drive for Virtual Memory 6/95

Article Created: 10 May 1991  
Article Reviewed/Updated: 1 June 1995

TOPIC -----

Why do I get a message that says my hard drive needs to be updated when I try to turn on Virtual Memory (VM)?

DISCUSSION -----

If you have not initialized your hard drive with a System 7 compatible version of the hard drive formatting software, you may need to do so before the system allows you to activate virtual memory.

If you have a third-party (non-Apple) hard drive, you may need to obtain from the manufacturer an updated version of the correct formatting software for that drive. If you have an Apple hard drive, you can update your hard drive software using the instructions below. The process does not affect the data on your hard drive, and it is very simple.

Step 1

-----

Locate the System 7 disk marked "Disk Tools".

Step 2

-----

Restart your computer with the "Disk Tools" floppy.

Step 3

-----

Launch the application HD SC Setup.

Step 4

-----

Click the "Update" button.

Step 5

-----

Click Quit.

If you are moving from System 6.0.x to ANY version of Sytem 7.x, you can follow these steps.

System 7: System 6 Fonts Still Used

Article Created: 13 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What will happen to fonts in my old System file when I install System 7?

DISCUSSION -----

You keep all of your existing fonts. While TrueType installs a number of TrueType fonts with System 7, TrueType fonts complement any bitmap fonts available on your Macintosh. Remember these points:

- All of the fonts in your System 6 System file are retained in System 7.
- If you request a font size that is available as a bitmap, your Macintosh uses the bitmap.
- If you use a size for which you do not have a bitmap, your Macintosh scales the appropriate TrueType outline.
- If you remove a bitmap from your System file, the Macintosh uses the TrueType font. Depending on the font and size you request, you will end up with either a bitmap font OR a TrueType font. Regardless of whether it's a bitmap or a TrueType font, your text will look great.

TOPIC -----

Under System 6, I've used Suitcase and Master Juggler, so my fonts don't take up space in my System file. Do I need these products with System 7?

DISCUSSION -----

Before System 7, Macintosh System software limited the number of fonts you could have in the System file. With System 7, that limit is so much greater that you can, for all practical purposes, disregard it. You may still want to use programs like Suitcase and Master Juggler to organize sets of fonts that you don't need access to all the time. Keep in mind also that one TrueType file, which can produce all point sizes in that font, takes up much less space in your system than the files for the equivalent bitmap fonts.

System 7: Italic, Bold, and Bold Italic in TrueType

=====

Article Created: 13 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Why are Italic, Bold, and Bold Italic listed as separate typefaces for TrueType (and Postscript fonts), but not for bitmap fonts?

DISCUSSION -----

When you're using a bitmap font and you choose Italic or Bold from the Style menu, the italic or bold type you see on the screen is a manipulation of the plain bitmap typeface. The plain font itself is modified--slanted forward for italic or thickened for bold--to create the style you've chosen.

TrueType and PostScript fonts give you separate, specially-designed typefaces, not just manipulations of the plain typeface, for italic, bold, and bold-italic styles. These look even better than the modified bitmaps, and are truer to the original designs.

Article Created: 28 May 1991

### Article Change History

-----

09/02/92 - UPDATED

- To include information on A/UX 3.0.

### TOPIC -----

Is A/UX software compatible with System 7?

### DISCUSSION -----

A/UX 3.0 is compatible with System 7.

A/UX version 2.1 is not compatible with System 7. The A/UX 2.1 startup application cannot be launched from a System 7 system. System 7 can't run in a Macintosh partition under A/UX 2.1.

Users who require A/UX functionality and who want to run System 7 should upgrade to version 3.0 of A/UX.

A/UX systems are network-compatible with System 7 systems. Users of the Macintosh partition under A/UX and still running System 6 should upgrade their LaserWriter drivers to version 7.0. This will make them printer-compatible with System 7 computers on the network.

#### Products Requiring Separate Upgrades

-----  
The following Apple products require software upgrades that are not included with System 7. See the System 7 Information icon on AppleLink for information on how to acquire the upgraded software.

#### Upgrades Available Now

|         |                                            |
|---------|--------------------------------------------|
| M0697   | Inter•Poll Network Administrator's Utility |
| M2700/B | AppleCD SC                                 |
| A9M0337 | Apple Scanner                              |

#### Upgrades Available June/July 1991

|           |                                 |
|-----------|---------------------------------|
| M6045     | MacTCP                          |
| M0108LL/B | MacX 1.1                        |
| M1043LL/A | MacX 1.1 Update                 |
| M0695     | MacDFT®                         |
| B0324LL/B | Apple Coax/Twinax Card w/MacDFT |

#### Upgrades Available Later in 1991

|           |                                 |
|-----------|---------------------------------|
| M0122     | Macintosh Display Card 8•24 GC* |
| M0516LL/A | A/UX Incremental Update Kit     |
| M0598LL/A | A/UX 2.0.1 CD-ROM Product       |
| M0616LL/A | A/UX 2.0.1 Floppy Product       |
| M0559LL/A | A/UX Update Product - CD ROM    |

\* Hardware is functional but software does not work in accelerated mode.

## Incompatible Products

-----

The following product is incompatible with System 7, but can be used with third-party backup software:

M2640/B      Apple Tape Backup 40SC

The following systems should not be upgraded to System 7:

B0452LL/A    Macintosh IIci A/UX Hard Disk 80 CPU (8MB)  
B0452LL/A    Macintosh IIci A/UX Hard Disk 80 CPU (8MB)  
B0453LL/A    Macintosh IIfx A/UX Hard Disk 160 CPU (4MB)  
B0453LL/A    Macintosh IIfx A/UX Hard Disk 160 CPU (4MB)  
B0471LL/A    Macintosh IIfx A/UX Hard Disk 160 CPU (8MB)  
B0451LL/A    Macintosh IIsi A/UX Hard Disk 80 CPU (5MB)

The following products should not be installed on a System 7-based system. Install System Software version 6.0.7 or 6.0.8 before installing these products on a server or router. They are network-compatible with System 7, and both System 6 and System 7 systems can use their services.

M0576          AppleShare Print Server  
M0548/B      AppleShare File Server 2.0
